Considering that this experiment was not tried with plants established during summer in the soil, but turned out in the middle of December, and immediately exposed to the inclemency of winter, it leads to the inference that heated soil must influence greatly the power which plants possess of resisting cold, even when accompanied by wetness. But it is very far from conclusive, and requires to be repeated, and varied in many ways. Supposing, also, that it had been wholly successful, there would still have remained the question of cost; for it might, and probably would, have turned out that to maintain the necessary earth temperature would be dearer than to cover the ground with a glass roof. If, however, the waste steam of a manufactory could be thus applied, the question would wear a different aspect.

We believe that the earliest suggestion of the possibility of turning STEAM POWER TO THE PRODUCTION OF AN UNDERGROUND CLIMATE, was made by the Right Hon. T. F. KENNEDY. We have now before us a letter dated "Treasury Chambers, Dublin Castle," in the early part of 1849, from which we make the following extracts:

"Some consequences at once occur to me as very important. I should think that the liquid might be injected into the subterranean pipes much less diluted than it can be applied on the surface to plants, whereby a smaller expenditure of power would be required for distribution, by steam power or otherwise. The utmost economy of the material would be secured, because all gaseous action would take place under-ground, and its whole effects would unavoidably go to use and profit.

"But another idea has occurred to me, which I am anxious to bring under your consideration, because I venture to hope that it may be of importance. I assume that a garden or field is laid with earthen pipes, in parallel lines, 3 feet apart, and 14 or 16 inches under the surface (the land being already either thoroughly dry or thoroughly drained), and that liquid manure is injected and absorbed by the soil in sufficient quantity. I assume also that the pipes are not less in diameter than 1½ inch; if 2 inches so much the better, and the mains considerably larger. My idea is, that *into these same pipes*, which convey the liquid, when they are either only partially filled or emptied by the absorption of the liquid, *there shall be injected* by steam power a *powerful current of heated air*, after the manner probably of the hot blast in smelting iron-stone, but of course at a lower temperature. By this means an *actual climate* may be created under-ground, the pipes will acquire and retain and emit heat, the gases of the liquid manure will be extricated (and the stronger the liquid the more powerfully), fissures in the subsoil will be created by the diffusion and action of the heat which will pervade the subsoil, the gases and the fluid will be rapidly absorbed, always under the pressure and retentive power of the incumbent soil, and the roots of the plants will be enticed downwards by the genial temperature, and by the supply of food.

"I venture to think that the effects of such a system, modified according to circumstances, may be very great, as applied to crops of all kinds, whether in the garden or on the farm, in the meadow or on the tillage land; but I forbear to enter into speculative details, because you will at once appreciate the notion either as important or the reverse.

"I may, however, observe, that atmospheric air is at least a cheap and not a rare commodity, and that to *heat* it cannot be very expensive compared to the value of the results which possibly may be attained. It would seem that almost a tropical climate might be created under-ground, while I fear that a British climate must remain on the surface; but still if the notion be not wholly fallacious, the results may be notwithstanding very great. To secure the passage onwards in the pipes of the hot air injected, it might be necessary to have the pipes to terminate in upright shafts, coming to the surface at long distances, which, while they would render the effectual injection of the air *practicable*, would not infer a great escape of heat; but even this might be regulated.

"Experiment can alone determine the mechanical working of such a system, as well as its effects on vegetation, but it seems to me that the combined effects of the injection, to any available extent, of liquid manure and of hot air, throughout a season, might produce very great results. Another mode of operation might be—first, the hot air might be injected in pipes under-ground, and, if preferred, the liquid might be applied on the surface; but, in that case, a large portion of the gases would be driven off, *unprofitably*, into the atmosphere.

"In either case, good draining pipes, even without collars, laid throughout the land, seem to be the only machinery required, with the aid of steam power, and a chamber in which to heat the air. The necessary interstice between each pipe, of 12 or 14 inches long, seems to afford an excellent escape for the fluid and gaseous manure, and for the hot air; and the greater the heat and the power employed for the alternate injection of *air* and *liquid*, the more rapidly and effectually may the process be carried into effect.

"In cases where land is to be cultivated deeply for a varied succession of crops, the pipes should probably be laid at a depth of 16 inches, so that there should be no interference from the plough or from the spade; but if the system were to be applied to permanent meadows, or to the growth of successive crops of Italian Rye-grass, the pipes might probably be placed at a depth only of 8 or 10 inches, by which means the action upwards of the manure and heated air might be very immediate and constant on the roots of the Grasses. The effect might no doubt be an almost unheard-of succession of heavy crops of Grass throughout a season; for in reality it would be a system of *continuous forcing* applied to the produce of our fields, instead of to the produce of our hothouses; and that by an extremely simple, and by no means expensive instrumentality compared to the value of its products. If applicable to field culture, the system might be still more applicable to market gardens, the produce of which is wanted at all seasons, and which, from the price they bear, would amply pay for any expenditure which might promote production at times more or less *out of season*."

Here we have, at least, a practicable method of employing steam-power pointed out, and one to which we presume that no objection would be made in the neighbourhood of a manufactory, although there might be some difficulties about it in mere agricultural districts. That a good deal may really be accomplished with economy in this way we entertain no doubt, at least between April and November; and that would be a material gain. But we cannot imagine that, in mid-winter, this kind of gardening would succeed, unless for the mere preservation of vegetable life; and for forcing purposes it would have little application, unless in the case of such productions as Mushrooms, Rhubarb, and Seakale. It is possible, however, that some of our intelligent correspondents may have some experience to produce, and, if so, we would earnestly invite them to communicate it for discussion and examination.

To the history of the VICTORIA WATER-LILY we have now the gratification of adding a second instance of its having produced its flowers, and this time near London, within reach of the curious who have no means of visiting Chatsworth. In a large tank, at Syon House, constructed upon Mr. PAXTON'S plan, the sovereign of the lakes and rivers has begun to blossom with great vigour, and will probably continue to do so for many weeks—or even

months to come. Each day produces its flower, which begins to open in the evening and bursts into full maturity in the succeeding day. This vegetable wonder will prove a subject of great interest to those who have permission from the Noble Duke to inspect the magnificent gardens in which it has appeared.

NOTES OF A TRAVELLER.—No. XI.

AN ACCOUNT OF THE DISCOVERY AND INTRODUCTION OF THE NEW FUNEREAL CYPRESS.—Permit me to give you an account of the discovery of the new Cypress sent home last year, and which you have described in a leading article, p. 243, 1849, and named C. funebris. If you will look at the map of the eastern coast of China you will observe the tract of a large river which falls into the Bay of Hangchow between the 30th and 31st degrees of north latitude. About 150 miles up this river, and near to the far-famed green-tea country of Wheychow (Hwuychow), the following notes were entered in my journal.

"But the most beautiful tree found in this district is a species of weeping Cypress, which I had never met with in any other part of China, and which is doubtless quite new. It was during one of my daily rambles that the first specimen presented itself to my eye. About half a mile distant from where I was, I observed a noble looking Fir tree, about 60 feet in height, having a stem as straight as the Norfolk Island Pine, and pendulous branches like the Weeping Willow. The branches grew at first horizontally with the main stem, then described a graceful curve upwards, and drooped again at the points. From these main branches, others, long and slender, hung down towards the ground, and gave the whole tree a weeping and graceful form. It was also very symmetrical, and reminded me of some of those large and gorgeous chandeliers which one sees in large theatres and public halls in Europe."

What could it be? It evidently belonged to the Pine tribe, and was more handsome and ornamental than them all. I walked—to tell the truth I ran—up to the place where it grew, much to the surprise of my attendants, who evidently thought I had gone out of my senses. When I reached the spot where it stood, it appeared even more beautiful than it had done at a distance. Its stem was perfectly straight, like the well-known Cryptomeria, and its branches were formed like those of the Arbor-vitæ, but much more slender and graceful.

The tree was growing in an inclosure belonging to a country inn, and was the property of the innkeeper. It was covered with a quantity of ripe seeds, a portion of which I was most anxious to secure. A wall, however, intervened between us and it. I confess I felt very much inclined to climb over it, but remembering that I was acting a Chinaman, and that such a proceeding would have been very indecorous, to say the least of it, this idea was immediately given up. Another scheme was adopted with the most complete success. We walked into the inn, and seating ourselves down quietly at one of the tables, ordered dinner. When we had dined, we lighted our Chinese pipes and sauntered out into the garden, where the attraction lay, accompanied by our polite host. We led the way towards the tree, and drew his attention to it. "What a fine tree you have here; we have never seen it in the countries near the sea where we come from: pray, give us some of its seeds." "It is a fine tree," said the man, who was evidently much pleased with our admiration of it, and readily complied with our request. These seeds were carefully treasured up and sent home to England, where, I am glad to hear, they are now growing most luxuriantly.

Afterwards as we journeyed westward the Cypress became more common, and was frequently seen in clumps on the sides of the hills. It had a most striking and beautiful effect upon the Chinese landscape, and I have no doubt in a few years to see the same effect produced by it upon our own. It will be particularly valuable for park scenery, for lawns, for the entrance to suburban residences, and as an ornament for our cemeteries. I have no doubt that it is quite as hardy as Cryptomeria japonica and the Indian Deodar, and will be a fit companion for both in our parks and pleasure-grounds. *R. F.*

PARSNIPS.

THE varieties of these that have been described or cultivated are the following:

Common Parsnip, aliàs Swelling Parsnip, Large Swelling Parsnip. Roots from 3 to 4 inches in diameter at the shoulder, tapering regularly to the depth of from 20 to 30 inches. Crown generally below the surface-level of the ground.

1. *Guernsey Parsnip*, aliàs Jersey Parsnip, Panais long, Panais Coquine. An improvement upon the preceding, the whole plant being larger and finer; roots sometimes 3 feet long, and Dr. M'Culloch states that in Guernsey its roots grow to the length of 4 feet. In quality it is much the same as the common Parsnip.

2. *Hollow-crowned Parsnip*, aliàs Hollow-headed Parsnip, Panais Lisbonais. Leaves shorter than those of the common Parsnip; roots about 18 inches in length, from 4 to 5 inches diameter at the widest part, ending somewhat abruptly with a small tap root; crown hollow round the insertion of the footstalks, and grows generally below the surface of the ground. The seed should be sown in shallow drills, the drills 18 inches apart, and the plants thinned out to 12 inches from each other; or to 15 inches if very large roots are desired. By good cultivation they have been grown to between 4 lbs. and 5 lbs. weight each. This is the best variety for general cultivation in gardens. The *Fourqué*, formerly cultivated in Guernsey, is an inferior variety of the above.

3. *Turnip-rooted Parsnip*, aliàs Round Parsnip, Panais rond, Panais Royal. Leaves few, root chiefly above ground, from 4 to 6 inches in diameter, in shape resembling a round Turnip, with a strong tap root. It is the earliest variety, and will succeed in ground too shallow for the long-rooted kinds.

There is a variety described in Noisette's "Manuel complet du Jardinier," and mentioned by Dr. Neill, in the "Edinburgh Enclyclopædia," which appears to remain a desideratum. It is called Le Batard ou de Siam Yellow; in form intermediate between the round and the long; more tender-fleshed and richer-flavoured than the other varieties. *R. T.*

DISEASES OF PLANTS.

(*Continued from page* 213.)

GENUS VII.; *one species*. SHAKES (*or Shakiness*).—This kind of injury is much more frequent and dangerous in its consequences than is generally supposed. Little care is taken how young plants are beaten about. Yet the shock may occasion the laceration of one or more fibres, a thing which, though it may not show externally, may bring the plant into a bad state of health, by the internal disorganisation which it produces. Wind, considered as a mere mechanical agent, is often the cause of this evil; thence the precept of agricultural writers not to plant trees in places exposed to certain prevalent winds. It is not, as some would imagine, that these winds carry with them saline particles which are supposed to form incrustations on the trees and thus to affect them, but rather that by striking them repeatedly in one and the same direction they occasion internal lacerations. Besides, when winds beat about the young branches of trees, they cause these to rub against each other. The wind indeed cannot be stopped. But a careful cultivator can guard against many causes of similar injuries, and especially he can prevent the great mischief done by cattle rubbing themselves against young trees.

GENUS VIII. CONTUSIONS.—I give this name to all sorts of bruises observed on plants. They may be occasioned by blows, such as the fall of hail, or by ligatures. Hence two species, *Contusions from blows*, and *Contusions from ligatures*.

The cultivator soon learns the injuries inflicted by blows; but when they are produced by the striking of hailstones, he is apt to attribute them to some specific injurious principle in the storm. It is, however, merely by contusions that the plants are wounded, or even completely broken up and destroyed. The parts struck are torn and disorganised, and the adjoining vessels being often more or less affected the evil spreads. Therefore, after a hailstorm, tedious as it may be, the injured trees should be visited, the affected parts cut out and covered with Forsyth's composition, or the *onguent de S. Fiacre*. This applies to the larger contusions. It becomes impossible for the smaller ones, which are the the most frequent, and which after many hailstorms do much damage to many trees. The only remedy is a good pruning the following spring. It is not trees only but herbs also that suffer from these causes.

Contusions of the second species are very common. In tying stakes to trees or Vines, in bending branches of fruit trees, the ligatures are often made so tight as to bruise them and bring on ulcers, the general result of ill-cured wounds. When grafts are bound too tight, the sap stagnates, and black spots indicating contusion may always be observed. Cultivators cannot be too frequently reminded not to tighten ligatures more than absolutely necessary, and always to use for bandaging materials of a certain degree of elasticity.

GENUS IX. EXCORIATIONS.—Not unfrequently, whether from ignorance or wantonness, the epidermis or bark is scraped or torn off. Cattle rubbing against smooth barked young trees will not only carry off the bark, but even lay the alburnum bare. Nature, it is true, will in many cases of herself repair the injury; yet in many others, by neglect the wound will be converted into ulcers. The careful cultivator will therefore, in going his rounds, examine his trees, and apply the pruning knife, wherever he perceives such injuries, and even if only the outer bark is torn off, he will take measures for protecting it from the action of wet or cold. In the case of our hardy trees such precautions may perhaps be ridiculed, but in botanical gardens many are the exotics lost from the neglect of them.

ON THE CONDITIONS ESSENTIAL TO THE MOST PERFECT CULTIVATION.—No. XIII.

EVERY day witnesses some improvement upon old systems, both in men and things, and every year records in its annals the destruction of some useless but time-honoured practice, and it is only when we look back from some point of progress, some intellectual eminence attained, that we become sensible of the advantage of the innovation, and wonder that we were so long blinded by prejudice.

Most assuredly one of the conditions *not* essential to perfect plant cultivation is a *porous* pot. And the day that shall witness its banishment from our gardens will be an era, even in this draining age of gardening. Half the difficulties experienced in the cultivation of hard-wooded plants arise from the necessity of using precautionary measures to combat the deleterious qualities of the porous pots in which the plants are grown. I am aware that such an opinion will meet with some opposition, and I may possibly be looked upon as an horticultural visionary, but I think a careful investigation of the subject will at least induce respect.

One great requisition in the successful cultivation of delicately rooted plants is, the absolute necessity of a certain amount of moisture in the soil. Once let a pot-bound Epacris or Erica be thoroughly exhausted of moisture, and it becomes almost impossible to induce water to resaturate the mass. The soil employed is adverse to the admission of water unless a given portion of moisture is present to separate the individual particles, and to act as conductors. Now, a plant growing in a porous pot, under ordinary circumstances, is subjected to an enormous (and, compared with natural conditions, a greatly augmented) surface of evaporation. The moisture of the earth, which should escape only from the surface (of course I do not allude to drainage), is constantly flying off from the whole surface of the pot. It might possibly be argued that the pot absorbs as well as gives off moisture. But I cannot imagine a condition under ordinary plant culture where the atmosphere of a house should hold in combination a greater amount of moisture than the soil ought to do. And it is with the evaporation of moisture as with the radiation of heat, any two bodies in contact or proximity will appropriate either in excess, according to their capacity for doing so. Again, it is a well ascertained fact in physics that evaporation produces coldness in a direct ratio to its rapidity or copiousness. And as it is so much insisted on by modern scientific gardening that the soil should be in advance of the air in temperature, it becomes a certainty that to produce a *vice versa* condition the best means would be to employ a porous pot. And here I would not be misunderstood. I would still employ the same material, mechanically speaking, but I would coat the exterior with a dense glaze, and also the interior of the pot for an inch or two from the surface of the rim.

For the healthy conditions of vegetation it is not needed that evaporation should take place from the soil, other than at the surface. By the present porous pot plan the labour of watering is increased three-fold with no ultimate benefit. On the contrary, the frequent use of water is calculated to deteriorate the soil, deprive it of its inorganic constituents, and to rob it of its porosity. The evil effects of porous pots are not so apparent in large as in small ones—the larger ones, on account of their thickness, offering a more formidable barrier to the escape of moisture. But the evil, if less in degree, is equally great in principle, and should be done away with.

By using non-porous pots we might, I think, adopt Mr. Knight's mode of Pine growing (*i. e.*, without employing a plunging medium for obtaining bottom-heat), with great success. Could such a condition be arrived at, everybody with a 12-light pit and a row of hot-water pipes might enjoy his Pine-apple, with less expenditure of labour than is required for producing a crop of Melons; and it is not too much to say that the culture of every tropical plant might be carried on with less trouble and expense than at present. I am at a loss to understand upon what principle the porous pot is insisted on. In what essential condition does it imitate a natural process necessary to the perfect development of vegetable life? In none; but on the contrary, it is calculated, as I have stated, to rob the plant of its necessary root moisture, which loss requires to be met by a constant application of the watering pot, involving an amount of labour which might be directed to a more useful channel. It is not only in decreasing the amount of labour and watchfulness, however, that the employment of glazed pots would effect a benefit, but in the general appearance of the pots themselves. No green lichens could obtain a footing, and any dirtiness could be so readily removed by the hand, or even with the syringe. An old pot would be as handsome as a new one, and the coating of glaze would render it less liable to be broken. But there is another objection to the ordinary pot, and that is on the score of taste; I allude to its colour. Nothing breaks up the harmony of a house of fine plants so much as the red brick colour of the pots. The employment of a bright red colour for gravel walks is not more at variance with true harmony in the keeping of garden scenery than that of bright red pots to exhibit plants in.

I would adopt Mr. Forsyth's idea expressed in an article in this Paper several years since, and have all flower-pots in which ornamental plants are to be seen of a quiet stone colour, or a neutral tint. I think it was Brown who was wont to say that a red-bricked house set a landscape on fire, and it might be said with equal propriety that red garden pots scorch the quiet effect of a greenhouse. Surely the time has arrived for paying some slight attention to taste in garden matters, but the progress is tardy. We still cling to the abominable "lean-to" to grow plants in, and for what reason it would be difficult to define, at least upon the score of utility. We have abandoned the old straggling system of plant growing for an opposite extreme; the knife and shears obliterate every natural characteristic of the plant so treated; and the old antiquated red brick flower-pot is still endured, let it be hoped, not because it is thought useful, but merely as a mark of esteem for past services. Let us, however, expect better things soon. *G.*

Home Correspondence.

Victoria Regia, at Chatsworth. — This plant is at present in the most vigorous health, the leaves are rapidly increasing in size, and have already arrived at nearly the same dimensions as the largest which was produced during the last season. A flower opened on

Monday, the 8th inst., and measured 13 inches in diameter; this is more than two inches wider than any which had previously expanded, the largest never before having exceeded 10¾ inches. I have also about 20 young healthy plants, which his Grace the Duke of Devonshire has kindly permitted to be distributed. I shall therefore be most happy to furnish a plant to any person who possesses sufficient accommodation for its successful growth; but no tank of less dimensions than 15 feet in diameter will answer for the purpose. Our new tank at Chatsworth, already in progress of building, will measure 33 feet across (inside measure), and, if necessary, we can add considerably to the size. Of the plant's duration it may be well to state, that the flowering specimen has formed large, fleshy root-stocks, and that its perennial character may now be considered almost certain. *Joseph Paxton, April* 10.

Feeding Bees.—It is an excellent plan to give bees a general feeding once or twice in the course of this month (April), on a mild day; it stimulates the workers to animation and activity, and thereby aids the bees in maintaining that temperature of heat in the hive, so necessary to the proper development of the brood, which is to form the swarms of the ensuing month. Two pounds of the best moist sugar, boiled a few minutes in one pint of water, in which two teaspoonfuls of salt have been previously dissolved, will prove a most welcome test. The liquor may be poured into any flat vessel, a wooden trough, or dish, with a board fitting the top of it, not exactly, but so much so as to prevent the bees from passing by its sides; it should be perforated with numerous holes, through which they may reach the liquor without danger. *Apiarius.*

Cropping a Kitchen Garden.—Will some of your readers give me some information as to the management of my kitchen garden. I have only recently come to this place, where I find to all appearance a beautiful garden, walled on all sides to a height of 14 feet. The soil is a rich rather light loam, situated on a gentle slope towards the south-west. The extent is nearly an acre and a half, yet I am told that I can grow neither Carrots, Parsnips, Potatoes, nor Celery. The Potatoes run to leaves alone, the others to tough stringy fibre. I cannot help believing that the chief cause of the failure lies in the gardener's ignorance of the right mode of succession in regard to his different crops. He seems to have no idea of arrangement, but uses any vacant ground that first comes to hand, for whatever purpose he requires it. I cannot dismiss him, for various reasons; and as he is a hard working honest man, I think by a little instruction, I may be able to remedy the evil. Under all the walls is a border about 3 yards in width, the central part is intersected by two hedges. Flowers, fruits, and vegetables have all been grown together in the central quarters, and the borders under the walls have been cropped with early Peas. The latter plan I have stopped at once; but in order to restore the fruit trees to health, I wish to know whether it is necessary to do more than leave the borders uncultivated and top-dress them; whether the roots of the trees must be artificially raised; or whether they will naturally throw their roots to the surface, if there is good soil to attract them. Would it continue the mischief if I used the ground to raise slight annuals? The whole extent of the border facing the north-west the gardener declares to be useless, except for winter greens. Is this the truth? Can no use be made of it throughout the spring and summer? The sun shines upon it from somewhere about 2 o'clock in the afternoon at this period of the year (April). Will some one give me a scheme for the proper rotation of crops in such a garden. I ought to say that the gardener declares that the soil is worn out (it has been made about 10 years); but the situation affords great facilities for a change of manure, as it is connected with a large farm, and close to the sea-shore. Hitherto it has been manured only from the stable; would not sea-weed be an advisable change? *L. B. S.*

Pond Mud.—In discussing this subject, we should first of all determine the meaning of the terms we employ. A "pond" is not a sufficiently definite expression whereon to hang an argument. I know ponds in Wales, each of which covers many acres of ground. They are constructed for, and the water is daily and nightly used by the immense iron works there, in hydraulic balances, the twyers, steam-engines, &c. To none of these ponds, however, can "D.'s" description of mud (see p. 201), apply, which, he says, "contains a considerable proportion of animal matters." The fact is, the mud of these ponds contains nothing of the kind to any appreciable extent, the efflux of the water being too active. "D.'s" description can only apply to stagnant water, say a pool or ditch, which is liable to receive decaying vegetable matter, or excrementitious filth, fit fœtid food for foul things to "knot and gender" on. With these premises, I can agree with "D." that lime and salt would be an unnecessary addition to such a compound, so redolent of fœtid animal and vegetable matter. As to his mode of removing the mud, I do not object to it on the whole, although I consider that a leathern pouch secured to a suitable iron ring, fixed at the end of a pole, is as efficient as the iron pouch, and far more easy to handle by the workmen. In point of fact, this working part depends rather on local circumstances and the manager than on any prescribed method beyond the general features. *W. E. Gill, Truro.*

Artistic Arrangement of Plants in Glass houses.—The remarks which you have lately made about cultivating plants without pots, in a more natural and tasteful manner than is commonly seen in greenhouses, have induced me to suggest to your readers a plan which I have often wished to put in execution had circumstances allowed me. It is this. That a moveable house should be constructed, which might rest on light iron pillars, inserted on blocks of wood level with the surface of the ground like a Tulip house, the size and shape depending upon the situation. If a place was chosen where there is natural inequality of surface and rocky sandy soil, a beautiful imitation of the vegetation of the Cape and Australia might be made by planting the various kinds of Epacris and Ericas, with perhaps a few Chorozemas, Diosmas, Boronias, Pultenæas, Genistas, Eutaxias, &c. The ground should be on a slope, and the paths should wind round real or artificial masses of rock. In the lower part of the house a small artifical pond or tank might be placed to hold the rain-water from the roof in winter. Some patches of Ixias, Babianas, Sparaxis, and such small Cape bulbs might be planted here and there at the sides of the path. Perhaps, at the back or centre, one or two Rhododendron arboreums, or some new Indian kind, might be

placed; but probably they would grow too large for a moderate-sized house. About May or June the whole of the glass might be removed, and the sashes and lights used in the Melon ground, &c. No bricklayer's work would be wanted, and no heating apparatus needed, unless perhaps a small portable Arnott's stove in the most severe part of the winter. In gardens where there are already good-sized plants of the kinds above named, the work would be very soon and easily effected. Iron and glass are now very cheap, and the whole would be in fact on the plan of a hand-glass. Many suitable plants might be obtained which flower at all seasons, and the place need never be without some blossoms. I have stated that a slope would look the most natural and picturesque, but of course it would require some artistic taste to arrange the thing properly. The accompanying sketch will convey some idea of my meaning. The back might be boarded and covered with the patent asphalte felt, which is a good defence against frost. A curvilinear iron house would be the most ornamental. The dotted line shows the natural slope of the ground. An erection of this kind must not be on too small a scale. *C. D. S., Chichester.*

—The superiority of the French in horticultural embellishment arises not so much from a practical acquaintance with art being more common with them than with us, as from a more correct estimate of what constitutes a man an artist. The phrase of the craftsmen of the middle ages when speaking of their craft, was "art and mystery," and a very appropriate phrase it was, for truly the art which could produce such works as those now collected for our instruction in the rooms of the Society of Arts, is a real mystery to the great proportion of those who call themselves artists in these degenerate days. In former times the influence of men of genius, famous painters, sculptors, and architects, was far more extensive and beneficial to arts and manufactures than can be the case now, at least in England, where every man, manufacturer or gardener, is his own artist. The French are wiser in these matters—they know that if they want a work of fine art, of whatsoever kind, they must go to an artist for it, and they make their selection from amongst those who have shown their ability by the production of great works. Were we weavers of figured silks, or printers of calico, and we could meet with an adviser in such a colourist as we have lately lost in Etty, we would never put forth a pattern until we had first obtained his approval of our design; and with regard to the appropriately picturesque in gardening, I believe that if men with such a thorough knowledge of composition and practical experience concerning scenic effect as Stanfield or Roberts were to undertake the arrangement of one of our great collections, such as that in the noble conservatory at Kew, we should have a school of art the influence of which would soon be felt all over the kingdom, and in which the artists of the Jardin D'Hiver might take lessons of taste. As the woodcuts given in your numbers of the 9th and 16th March may enable me to render some of my former observations on the subject of fine art more intelligible, I beg again to refer to them, and I am the more desirous of doing so because they suggest a few hints which may possibly prove of use to those who are desirous of investing their plant-houses with an interest beyond that resulting from the beauty or peculiarities of the individual plants. With regard to the print from Von Martius, I would observe that however valuable in respect of its truth of detail, I by no means adduce it as a specimen of artist-like picturesque arrangement; on the contrary, it affords an instance of that faulty kind of composition which I had in view some time ago when I gave a caution against the admission of equal quantities of similar forms. If it were a view of the interior of a conservatory instead of a Brazilian forest, the position of the two trees constituting its most important features might be accounted for and excused on the supposition that they were so placed to conceal the supports of the roof; and had pictorial effect been the object, it might easily have been obtained by giving some of the interesting forms in the middle distance greater connection with the foreground. There is, however, one pictorial feature in the print after Von Martius, which (common-place though it be) is notwithstanding very preferable to the corresponding portion of the print from the Horticultural Society's Transactions, given in your Journal of the 16th ult. I allude to the grouping of the objects (below the eye) in the near part of the foreground, which may be taken as an illustration of what is termed breadth, as opposed to "littleness" and "spottiness," of which latter defects the one—two—three—four little independencies occupying the foreground of the Society's print is a palpable instance. I must not, however, forget that the sketch was probably taken at a time when allowance was made for the massing and connection of the parts by their growth. Although the waterfall and its adjuncts are by no means badly conceived, I should have been better satisfied had the two portions into which the fallen stream is divided been less equal in height; and I could moreover have wished that the upper half had been virtually divided into two or three streams, for the sake of variety, as well as for the purpose of adding by contrast to the importance of the lower fall. I am also reminded by this print of another way in which I think the imitation of Nature might be considerably advanced, and the composition rendered more pictorially perfect. Instead of those queer looking little logs of wood dangling from the rafters, on which beautiful Epiphytal plants are usually gibbeted, I would have a real tree, or a considerable portion of one, the branches of which might be so arranged as to lead the eye from contemplating the rafters of the roof, and at the same time afford most appropriate habitats in its forks and branches for the most beautiful and interesting objects in the whole vegetable kingdom; and what an invaluable adjunct an old Oak tree might be made to such a waterfall as that of Mr. Llewellyn! *M.*

Birds: Tomtits.—I was very glad to find that a naturalist who stands so deservedly high as Mr. Doubleday should have come forward in favour of my old friends, the tits, about whom you may remember I had a few years ago a somewhat furious contest in your Paper with one "Furibus hostis," upon which occasion I took exactly the same grounds as Mr. Doubleday has now done with convincing force. Equally glad was I to see that, although Mr. Graham would not be convinced against his will, he yet generously conceded the point that tomtits do more good than harm; and his example might be followed with great advantage to themselves, with great credit to their humanity, and with undoubted benefit to their pockets, by those who continue still to poison by the bushel those birds which an all-wise Providence has created for our good. In this utilitarian age there is a strong tendency to sacrifice all that is beautiful in mind and body, as well as in the fresh green, joyous Nature by which we are surrounded, to the desire of making money. *Cui bono*—let me ask, to the mass who are bent upon these destructive principles? Carry out your views to the utmost extent. If it is a good thing to poison the birds in any given district, it must be a law of universal application. Carry out then, I say, your views—poison every bird, cut down every tree, and level every fence in the United Kingdom, and again let me ask, *cui bono?* Suppose you gain a few more bushels of corn per acre, would that repay you, or would the country thank you for turning it into a dull, monotonous, matter of fact, manufacturing sort of thing! But, suppose the contrary is the case, and as I have no doubt you will soon find to your cost your bushels per acre increase, in imagination, will dwindle woefully down; who then, I say, will thank you for turning fertility into barrenness, beautiful England into a sterile wilderness? Your own ruin is of small consequence in comparison with the misery which such conduct would entail upon the community. A gentleman who has permitted me to make use of his name, Mr. Paul, of Harleston in Norfolk, called upon me a few weeks ago, and informed me that, whenever in his district birds had been poisoned, the wireworms had increased immensely. Of course, in a few years, the system will tell with wonderful and amazing force. The wireworm remains as a larva three or four years in the soil, and as it generally feeds underground, it cannot be got at by the birds; but when it changes into the perfect insect, a beetle, the Elater lineatus, it then becomes the prey of the birds you poison. For every elater eaten by birds, probably a thousand wireworms are destroyed. The Royal Agricultural Society's prize for the destruction of wireworms might be gained by an essay of three words—"Protect the birds." Rooks, sparrows, tomtits, robins, finches, and most of our summer visitors are on the look out for these beetles, and all the return they get is a dose of poisoned Wheat, laid out for them by the ill-judged obstinacy, I was going to say stupidity, of the farmer. Again, the caterpillar of a moth, the Agrotis segetum, and allied species, in some seasons will destroy the Wheat and Turnip crops of an entire district. Poison the birds, and of course Agrotis segetum and its congeners will live to deposit its eggs, and the caterpillars resulting therefrom will live to eat your crops. *C. R. Bree, Stowmarket.*

——I must once more reply to Mr. Graham. I really believe he is mistaken about the blue titmouse. I am quite certain that it never picks off or in any way injures

the buds of the Cherry in this neighbourhood. A Cherry tree stands close to my house, and on this tree the blue titmouse may be seen almost daily, but I never saw one single bud removed; and I have closely watched a pair to-day on this tree within two yards of the window. In the garden the ground is often strewed with the remains of the buds, but this is the work of the bullfinches; these birds often seriously injuring the Cherry trees just as the buds begin to swell. The marsh titmouse may often be seen clinging to the heads of the wild Teazel in winter, and a superficial observer would suppose that he was engaged in extracting the seeds—whereas he is searching for the larva of an elegant little moth—Penthma gentianana, which feeds on the pith of the Teazel; and although there is nothing by which we can distinguish the heads of the Teazel which contain larvæ from those which do not, yet this little bird never opens a head which does not contain a larva. *Henry Doubleday, Epping.*

Fruit Protectors.—We have received from Mr. Halliman, of Queen's-place, Norland-square, Kensington, a letter, in which he explains his opinion respecting his fruit-protectors. He says that "the common striking-glass was not selected as a pattern for it; it was the old-fashioned straw bee-hive and the finger-glass used at table that first suggested the shape to him; and, like the straw bee-hive, it can be made cheaper than any other glass that can be blown fit for the same purpose. The fruit-protector assists Nature in our cold climate, and places the fruit from 5° to 20° farther south than it would otherwise be. On account of its shape, no scorching can or will take place. When the air inside is raised to a certain degree of heat, it quickly passes out at the uppermost edge, and fresh air freely enters in at the lowermost edge; the trees always enjoy free air, and can be dressed or syringed in the common way. The protectors are easily fixed on the tree, and the fruit can be gathered with facility. Oval protectors are objectionable and dear; holes, to pass the wire through, are also objectionable, and would make the contrivance dearer; dents in the edge, to fit the branches, are objectionable, but they can be made with them for the same price; in a word, the fruit-preservers increase the richness and flavour of the fruit." Our readers must judge for themselves how far these advantages are equalled by the cost of the protectors.

A Precedent for the Great Exhibition of 1851.—The Royal Commission lately issued in England for the exhibition of the works of industry of all nations in 1851, and over which the Royal Consort of our most gracious Queen will preside, bears a very close analogy to another great commission of very similar import, relating to all animated nature throughout the known world, instituted above 2000 years ago by Alexander the Great, at that time one of the most powerful monarchs on earth. It is faithfully recorded in Pliny's "Historia Naturalis" (lib. viii. cap. 16, page 107). I will transcribe the paragraph alluding to this commission from a good copy of Pliny now before me (dated 1526), which, besides bearing the initials of the celebrated Dr. Johnson, has the following remark apparently written by him, opposite the title-page, "The emendations of Hermolaus Barbarus, Patriarch of Aquileia, render this edition of Pliny's Nat. Hist. extremely valuable." "Alexandro Magno rege inflammato cupidine animalium naturas noscendi delegataque commentatione Aristoteli, summo in omni scientia viro, aliquot millia hominum in totius Asiæ Græciæque tractu parere jussa, omnium quos venatus, aucupia, piscatusque alebant. Quibusque vivaria, armenta, alvearia, piscinæ, aviaria, in cura erant; ne quid usquam gentium ignoraretur ab eo. Quos percontando, L ferme volumina illa præclara de animalibus condidit. Quæ à me collecta in arctum cum iis quæ ignoraverat, quæso ut legentes boni consulant, in universis rerum naturæ operibus medioque clarissimi regum omnium desiderio cura nostra breviter peregrinantes." Which may possibly admit of the following interpretation: King Alexander the Great, being anxious to know the nature of animals, by his commission given to Aristotle, then the leading person in every science known; commanded that some thousands of men throughout the tract of all Asia and Greece, should assemble and obey him, as well all hunters and fowlers, and fishers, as those who had the care of parks, and herds, and flocks, and apiaries, and fisheries, and aviaries, in order that he might become acquainted with the manners of all nations (Gesner, in in his celebrated work of Animals (1551), in copying this paragraph, has used the word *genitum* (aliàs *gentium*), whereby the translation may be rendered, the nature of all things created or begotten). By examining whom, he (the said Aristotle) formed almost 50 excellent books (that he styled), "De Animalibus," which being compiled by me (Pliny) in a smaller compass, I pray my good readers may consult, together with those matters I have added, of which he was uninformed, relating to the universal operations of nature, that they may, travelling with me, in the like desire, of that best of all kings be equally gratified. *Edward Scudamore, M.D., St. George's-place, Canterbury.*

Garden Walks.—I think I have walks both better and cheaper than those you commend. A few years back I hesitated a long time between gravel, lime chippings, and other kinds, and ultimately made my present walks more with a view to economy than perfection. After two years' experience of them, I still prefer them to any other for general use, though I would perhaps rather have white lime chippings if I could always keep them dry. Mine are dry, firm, and clean in all weathers, and are at all times free from that very great objection of adhering to the shoes when walking. I first covered the walks with foundry cinders (no cost except a trifle for cartage), which, being well rolled in after wet, made a dry hard foundation; then I procured a few cart-loads of the burnt brickdust from a brick kiln, which made a nice, smooth, bright red surface, and this after a little usual rolling formed capital walks, that have not since required any further attention. The cinders not only keep the walks dry, but also prevent the growth of weeds, and keep worms from any interference underground. For appearance, they can at any time be renewed by a thin sprinkling of fresh dust, and the cost is so very trifling as not to be worth notice. My walks are on a level with the adjoining borders. Such of your readers as find gravel expensive, will find some benefit from trying my plan. *G. F.*

Seed Lists: Peas.—It is not our intention to enter into a paper war with you, but we cannot allow the leading article in your Paper of the 6th inst. to pass unnoticed. You say that "Messrs. Beck, Henderson, and Co., in the Strand (our letter is dated from Middle Wharf, Adelphi), have criticised, with no remarkable civility, the valuable attempts which our correspondent 'R. T.' has made at our request," &c. It is well we were not charged with having criticised your correspondent's valuable attempts with remarkable incivility, for it must be evident to any unbiassed person that the writer of that article could not have seen our letter. We think, however, that we may very justly charge you with having treated us not merely with incivility, but with actual scurrility. Your correspondent "R. T." does not appear to be very indignant at our lack of civility, for he has very temperately and fairly replied to our criticism; but we still differ with him respecting the Pea called by the French Nain Hâtif. This Pea, notwithstanding the authority of the "Bon Jardinier," is not, or certainly was not, the same as Nain Hâtif L'évêque. You also say, "They charge him with sundry inaccuracies, and tell us that there are plenty more that could be pointed out; nevertheless, while indignant at his criticism, they in the main admit his accuracy, and vow that if they do sell trash it is to oblige their customers." We ask in what part of our letter is such admission to be found? On the contrary, we have denied his accuracy, and said that if we were to notice the whole of his blunders, we should fill the whole of your Paper; and so far from having evaded the question, we have offered, if not directly, certainly by implication, to give you the origin of many of the synonymes, and the reasons why they are retained in the lists of many of the most respectable houses in the trade. We are at a loss to conceive what could have drawn down such vengeance on our heads, unless it is that we have presumed to criticise the labours of your correspondent "R. T.," or that we should have been so arrogant as to append our signature instead of initials to our letter. But that your readers may better understand this subject, we refer them to leading articles in your Papers of this year—in No. 3, page 35, and in No. 5, page 67, and to "R. T.'s" lists of Peas, &c., in No. 3, and subsequent papers; then to our letter in No. 13, p. 198, and to your leader in No. 14, and leave them to judge between us. Your correspondent, "R. T.," and ourselves are still at issue respecting Warner's Early Emperor Pea. He says its habit of growth is intermediate between the Early Kent and Early Frame. Habit of growth is not the question. Is it, or is it not, as early as the Early Kent, with pods much larger, and a more abundant bearer? If not, how does it happen that seedsmen and market gardeners (who we presume must be the best judges) will and do give a much higher price for the Emperor than the Kent? If "R. T.'s" remarks are founded upon experiments made by himself, from whence did he obtain the seed? for this we conceive to be of the first importance. Did he obtain it from Mr. Warner, of Cornhill, who first introduced it? If not, his remarks are of little value. You also say, towards the end of your leading article, "The example has been set them well by several of those whom they presume to call 'little people,'" &c. We again ask in what part of our letter is such an expression to be found, or anything like it? Echo answers—Nowhere. You also recommend us to put our house in order; this was done before the writer of this and our preceding letter was connected with the house, in which he became a principal about 45 years ago, and we fearlessly assert that in no instance has the honour or respectability of the firm been called in question before your last publication. As to our selling trash, that in the present instance we shall leave to the decision of our numerous correspondents; but should such another unwarrantable libel be inserted in your Paper, we warn you that legal proceedings will be taken to vindicate our character. As you have given very conspicuous publicity to such a serious and unfounded charge against us, we trust that you will give equal publicity to this letter in your next Number. *Beck, Henderson, and Co., Middle Wharf, Adelphi.*

[It Messrs. Beck and Co, when they are cool, will read again the article to which this production purports to be an answer, they will discover that we have nowhere charged them or their house with that of which they complain. The latter part of our observations was purposely disconnected with their name, having relation to notorious practices of every day occurrence, and to no one special act. As to the rest of their letter, it does not call for either reply or explanation.]——I am pleased to see that you are endeavouring to effect a reformation in the seed trade. It is important to expunge from seed lists all mere synonymes and varieties possessing so small a shade of difference as not to render them worthy of being retained; and it is requisite that a combination of those seed-buyers who discern the good that must ultimately accrue from an alteration in seed lists, should patronise the seedsmen who came boldly forward to make the required concession. As a guide to the seller and purchaser of garden-seeds, and as a foundation for the permanency and stability of the change referred to, it is essential that a standard of reference should be made accessible to all interested in consulting its pages. The Horticultural Society of London, considering the competency and skill of those by whom its operations are conducted, and the great facilities at its disposal, is unquestionably the source from whence such a desideratum might proceed. A list of seeds formed on the plan of its fruit catalogue would prove of as much advantage to the class for which it is designed as the fruit catalogue is to pomonologists, and be of equal authority. New varieties of great merit might be added as soon as they were sufficiently proved. Some perhaps might imagine that the adoption of this course would prove a barrier to the advancement of the art of improving the various races of vegetables. It would no doubt check the practice of retaining varieties of no merit, for thereby no premium would be held out to the raisers palming them upon the public; but those possessed of real merit would, upon an impartial investigation of their improved characteristics, be recognised as such; and through the above medium their superiority would be guaranteed. The publication of a select catalogue would, therefore, prove beneficial in many respects; it would be a pattern for the seedsman to imitate, a guide for purchasers in the choice of seeds; it would tend in a great measure to prevent the public from being imposed upon in purchasing new varieties of seeds, as those excluded would be considered beneath mediocrity, and the palm of merit would be accorded to those that deserve it. *A Subscriber.*

Societies.

ENTOMOLOGICAL, *April* 1.—G. R. WATERHOUSE Esq., President, in the Chair. The President nominated Messrs. Douglas Stainton and J. F. Stephens to examine the monographs of Tortricidæ, sent in for competition for the prizes offered at a previous meeting. He also gave notice that the council had determined to reduce the price of the volumes, forming the first series of the Transactions, to the members, and likewise called attention to the series of works proposed to be published by subscription, entitled "Insecta Britannica," under the superintendence of a committee, consisting of the president and secretaries of the Society, together with Messrs. Spence, Stephens, and Saunders; the subscription for the first five volumes of which, containing the British Diptera, Hemiptera, Homoptera, and Microlepidoptera, is fixed at 4*l.* 10*s.*, being at the rate of 18*s.* per volume, to be paid annually on its delivery. The subscription list is headed by H. R. H. Prince Albert. Mr. Westwood exhibited a specimen and drawing of Cholovocera Maderæ, a new coleopterous insect of minute size, remarkable for wanting the ordinary compound facetted eyes, the place of which at each side of the head is occupied by six small semiglobose translucent ocelli, similar to the organs of vision of many larvæ. This is the only instance in which such a structure has been observed throughout the whole of the tribes of winged insects. He also exhibited some minute insects fixed upon small slabs of gelatine, which, from its perfect transparency, is better fitted for mounting microscopical specimens, than talc or card. Mr. Stainton exhibited specimens of Micropteryx aruncella, Scop. (concinnella, Steph.), and Mr. S. Stevens, some very splendid butterflies, from the river Amazon, collected by Mr. Wallace. Mr. Douglas exhibited a Noctuideous pupa, found in a Thistle stem, and also the larvæ of some small species of moth, which form a hybernaculum on the terminal shoots of the common broom. He also read descriptions of two new British Microlepidoptera. Mr. Stainton exhibited some plants of Helianthemum vulgare, the leaves of which were mined by a small Lepidopterous insect, most probably a species of Elachista. Mr. Sydney Saunders read an elaborate paper upon two new Strepsipterous insects, from Albania, parasitic upon bees of the genus Hylæus, forming a new genus, to which he gave the name of Hylecthrus.

STOKE NEWINGTON CHRYSANTHEMUM, *March* 28.—Mr. LAIDLAW in the chair. Mr. Holmes opened the discussion by reading an essay on the cultivation of this fine autumnal flower. He offered some remarks on new varieties, and on the difficulty of obtaining seed in this climate. The only important improvement that had taken place, he said, was in regard to cultivation. Some of the oldest varieties were still the best. In incurved flowers, Goliah and the two-coloured Incurved stand unequalled. In the other class, Superb-clustered Yellow is far before all newly imported ones, and if we cannot save seed here, he thought we should resolutely set ourselves against the reception of all new sorts that are not improvements on older kinds, and thus induce our southern neighbours to devote more attention to superior varieties. For the pleasure-garden, where protection is inconvenient, he recommended only the early sorts, such as Queen, Imperial, Goliah, Princess Marie, &c., assigning as a reason that frosted buds never expand well. He stated that specimen plants should consist of such kinds as Phidias, Lady Camerson, Queen Victoria, Vesta, and Queen of the Belgians; but that these would be almost useless where cut flowers for exhibition was the object aimed at. For the latter purpose he recommended Goliah, Aristides, Beauty, and others of similar habit. He remarked that the latest sorts were generally the finest, such as Perfection, Campestroni, King d'Or, and two-coloured Incurved. Late sorts, he said, should be struck in autumn, for if this operation is delayed until spring they often proved abortive; cuttings of the medium flowering varieties, such as Pilot, General Moreau, Defiance, &c., should be put in in the third week in March, and those of the early sorts, as Imperial, Queen, Princess Marie, in the latter end of April. He preferred cuttings to suckers, placing them round the edges of 5-inch pots, in light sandy soil, well drained. He advised the cuttings to be placed in a close frame, with a little bottom-heat; when struck they should be hardened and potted singly in 5-inch pots, protecting them for a short time, and finally shifting them into the pots or place where they were intended to bloom. In cultivating Chrysanthemums for cut blooms, regardless of height, habit, or appearance, the plants should be divested of all side shoots in their early stages, trained up in single stems, kept unstopped and only one or two flowers at most left on each stem. For specimen pot plants shift at once into 12-inch pots, using equal

parts of forest loam and well-rotted manure, with plenty of drainage. One or three plants may be put in each pot, placing them where they can get all the sun and air possible. As they advance in growth, train and regulate, so as to secure a healthy foliage. Plunging the pots, he said, had a twofold advantage—it secured the roots from drought and prevented the plants from being blown over by the wind. As soon as they show their flower-buds, he would begin at once to thin them, leaving only the centre bloom; that is, he strips off all side buds, in order to give additional strength to the remaining buds, which causes them to expand uniformly. To preserve the flowers in perfection, they must be protected not only from frost but also from rain.—Mr. Croxford questioned Mr. Holmes, and also Mr. Tant, on the best method of taking cuttings. Mr. Holmes preferred cuttings off the best and strongest suckers. Mr. Tant had taken cuttings off suckers, and also off the stems of the old plants, with the same results; he also remarked that it was difficult to get suckers from many of the varieties. He considered liquid manure highly beneficial for the full development of the foliage and flowers; but it should be withheld when the latter begin to expand. Half a pint of guano dissolved in 6 or 8 gallons of water, and applied as circumstances required, had been found of much service. Mr. James had applied liquid manure to his plants in all stages and seasons, and with equal success. Mr. Taylor had struck his cuttings later than Mr. Holmes had recommended, and had been most successful: his finest flowers were grown against a south wall in a well prepared border; the flowers protected by glasses hung against the wall. In plunging the pots, it was recommended that the hole should be made 6 inches deeper than the bottom of the pot, or that the latter should be set on bricks on edge, with a cavity between them.

Review.

China and the Chinese: their Religion, Character, Customs, and Manufactures, &c. &c. By H. C. Sirr, M.A., Barrister-at-Law. 2 vols. 8vo. Orr and Co., London.

We fear that the reader who expects new information from this work will be disappointed. It is the production of a gentleman haunted by one idea—the abhorrence of the opium trade; and the main purpose of the work is to assist Mr. Montgomery Martin in denouncing it. We cannot avoid suggesting to Mr. Sirr and his friends that it would be quite as well to look at home in the first instance, and to commence their crusade by an attack upon Irish whisky, Jamaica rum, English gin, and American Tobacco. Until that is done, philanthropic labours on the other side of Asia are superfluous, and can hardly hope for sympathisers in Europe. That opium smoking is an evil, is not disputed; but so is gin drinking, and so is sotting in a rural beer-shop. These vices are of equal magnitude, and demand equal vigilance, if they are to be suppressed. To say that opium smoking is much worse than these are, is, we believe, to assert what is not only incapable of proof, but directly the reverse of the fact.

Passing by this hallucination, we must also express some doubts as to the accuracy of statements concerning mere matters of fact. For example, oil of the finest quality is said to be obtained in China from Apricot stones. Is this so? On the other hand, Camellia oil is omitted. In a country abounding with Laurels, it is rather strange that Mr. Sirr should know of only one, the Camphor Laurel. Then a kind of Sycamore is said to yield materials for paper, a statement which we undertake to say is founded on some mistake. So, as to indigo, it is clear that our author's information is not very clear upon that point, for although he names "the Indigo plant" and "a species of Polygonum" as the sources of Chinese Indigo, he entirely omits the Chinese Woad, Isatis tinctoria, from which the whole of the indigo of Shanghae and adjacent provinces is prepared. Among the marvels of Chinese gardening is mentioned, upon hearsay, "an Orange tree which had been distorted into a complete representation of a human hand;" did it never occur to Mr. Sirr that his informant was talking of the well known fruit of the fingered Citron? Another prodigy, not mentioned upon hearsay, but which bloomed in the possession of the author, was a very curious Camellia japonica, the colour of which was "*a unique bright purple*, or mazarine blue;" upon which it is remarked that, "we have been repeatedly asked by botanists if we were quite sure that we did not mistake the colour of this extraordinary flower; our reply was 'Do you think we would tell a lie?'" Notwithstanding this Hibernian mode of stopping a doubt, we must be permitted to say that although we "do not think that the author would tell a lie" we believe him very capable of making a blunder; and that the flower, although blue, as he describes it, was no Camellia. Among Chinese vegetables we find enumerated "orcus," what is that? Apricots, by which we suspect Loquats to be intended, for the latter are nowhere mentioned; and a Plum from Ching-chow, "ten millions times more delicious in flavour" than an Egg-Plum. We can only express our regret that Mr. Sirr did not occupy himself usefully in bringing this Plum to England, rather than in putting together such useless matter as much of his book consists of.

Garden Memoranda.

S. Rucker's, Esq., Wandsworth.—Since we last visited this delightful villa, several new glass houses have been erected, and a considerable addition made to the lawn. A nice span-roofed Orchid-house, 26 feet long by 18 feet wide, has just been put up, to which the flowering specimens are removed as they come into blossom; and a new Heath-house, 50 feet long and 16 feet wide, has been built, as well as some useful pits. One long span-roofed house called the "Heath pit" contained some extraordinary examples of that interesting genus. A plant of splendens measured 4 feet high and as much through. Some idea of its rate of growth may be formed when we state that since August last it has made young wood a foot in length. Associated with it were remarkable plants of vasiflora, just coming into bloom; favoides elegans, a handsome Heath, in the way of the vestitas; Hartnelli; retorta, and its larger variety; tricolor Wilsonii, a large-flowered kind; and a very fine ferruginea. This Heath pit, which is at least 40 feet long, is heated by hot water in 2-inch iron pipes from one of Shewin's conical boilers, which also warms a small span-roofed stove, standing at right angles with the side of the pit. One side of this stove is furnished with a tank, through which the hot-water pipes are passed; the tank is closed in with slates, on which an inch of sand is laid, and on that flat earthenware tiles. On this heated bed Gloxinias (among which the curious Fyfiana and Wortleyana, one of the best of the light kinds, were in bloom), Achimenes, Begonias, Æschynanths, and other soft-wooded stove plants are forced into flower for the early spring decoration of a pretty little conservatory which is attached to the dwelling house, and which, by means of this pit and a warm greenhouse, is kept gay the whole year round. Its (the conservatory) present occupants are Hyacinths, Roses, Geraniums, Azaleas, Camellias, Cinerarias, &c.; the latter have been in flower here ever since last September. This is effected by taking off offsets as early as they can possibly be obtained, and keeping them growing on all through the summer season. In this way they come into flower just at a time when they are most wanted. Franciscea acuminata has been found to be a most useful plant for conservatory display where a little stove like that we have just mentioned exists for *growing* it in. Aphelandra aurantiaca, and the showy Æschynanth (Æ. speciosus), brought forward in the same way, have also proved very serviceable. A fine head of bloom may be obtained from the latter even in a 5-inch pot, and, by removing the flowering shoot when it goes out of bloom, another flowering branch quickly takes its place. Begonia fuchsioides and Æchmea fulgens likewise contribute not a little to enliven a conservatory in winter and early spring. The latter may be increased by suckers exactly in the way in which Pine-apples are propagated. In the greenhouse, which is always kept rather warmer than houses of this kind usually are, some large Azaleas were in full blossom, and others were coming fast forward. Behind the Azaleas were Camellias which had done flowering and were making their wood; and these again were backed up by tall Orange trees just bursting into bloom. The front and side shelves were filled with Geraniums. In the Heath-house was a beautiful plant of Hovea Celsi in full blossom. It was at least 6 feet high, and had been allowed to "run up" with four stems which, although naked at the bottom, were well clothed three-parts of their length with flowering wood, and, managed in this way, by which its natural character was exhibited, this plant looked much more graceful, and had a far more striking effect, than it would have had twisted and twined round stakes. Beside it was a trained plant of the same Hovea; and as some may wish to know the best way of keeping it "bushy," and in a comparatively small state, we will mention how it was managed. A main stem was allowed to grow up the centre; the first tier of branches from this was brought down as near the pot as they could be got; the points of these after a time turned up, another tier was drawn down, and the points of these turned up in the same way; a third and a similar effect followed, and in this way a "bushy" pyramidal specimen may be obtained; but it will never look so well as a plant which has been allowed to follow, as near as may be, its "natural bent." The Heaths in this house were all in admirable condition, and promised abundance of bloom. Crassula was in full blossom, and so were elegans stricta (a remarkable plant of the kind), mutabilis, and some others. Among Orchids, which contain some of the finest plants in the kingdom, as those who have seen our great metropolitan exhibitions can testify, the following were in blossom. The yellow-flowered Lælia (L. flava), Schomburgkia violacea, Phaius Wallichii, various Dendrobes, among which we observed the charming yellow-flowered D. chrysotoxum, D. Jenkinsii, and D. aggregatum—as well as several of the purple and white kinds; a fine plant of the long-tailed Lady's Slipper (Cypripedium caudatum), producing a spike 2 feet long, surmounted by two flowers whose tails were at least 18 inches in length; Vanda tricolor and the sweet-smelling Vanda suavis; Galeandra Devoniana, with three handsome spikes of flowers; the charming Odontoglossum Cervantesii and O. Insleayii, a somewhat scarce species; the rare Burlingtonia fragrans, Leptotes bicolor, a mass of flower, and various others. Both the plants and the place exhibited the best possible management, and reflected the greatest credit on those who have the care of them.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Orchids.—All those species which are commencing a new growth should be carefully examined and repotted or surfaced, according to their respective requirements. Let the old stuff be picked away as far as is possible without injuring the roots. The most suitable material in the shape of soil for these plants is half decomposed leaf-mould, which has been sufficiently baked or sweated to destroy everything pertaining to animal life; this should be mixed with one-third its bulk of pure sand, and interspersed and packed with small blocks of turfy peat. Perfect drainage, however, is unquestionably of the greatest importance in the cultivation of Orchids, and to secure this, a portion of pots-herds should be mixed up with the soil, except in that for Stanhopeas, as the latter protrude their flower-stems through the bottoms of the baskets, which for this genus should be considerably shallower than the hemispherical ones recommended for general purposes. A liberal supply of water must be given to those plants which are in an active growing state, and a warm moist atmosphere must be retained during the day in fine weather, and especially amongst Vandas and their congeners from the hottest localities, and Dendrobes, which are in a growing state. Shading in bright strong sunshine is indispensable, but the abuse of this is as common as the use of it. The canvas should be so arranged that it can be removed or applied in a few moments; as the difficulties of covering or uncovering, in many instances, prevent the necessary attention to this matter. Conservatory. — Climbers should now have a portion of their shoots pruned hard, to produce growths for late autumn flowering. The training of the young shoots should have regular attention, that they may at all times look neat; on the other hand, carefully avoid the stiff formal appearance which is produced by tying in their shoots to their extremities. If the house is sufficiently lofty, climbers look most graceful when they are allowed to hang down from the rafters in natural festoons. Plants in conservatory borders (whether climbers or otherwise), which have been planted in former years, should have as much of the old exhausted soil removed as can be done without materially injuring the roots, and the space filled up again with fresh compost; and, at the same time, if any alteration in their arrangement is desirable it should be made. On a careful scrutiny of the plants, many will present themselves to notice, which will form greater objects of attraction if planted out than they will if confined in pots. In making a selection for this purpose, those sorts should be chosen which are remarkable either for the beauty of their flowers, for continuing a long time in bloom, or for their elegant and ornamental appearance in habit or foliage. Let the soil for these plants consist of roughly-chopped turves of loam or peat, with an admixture of richer materials according to their special requirements; but let the surface be covered with finer soil for neatness sake. As the season advances, heat and moisture may be more liberally supplied to tropical plants, increasing them gradually in proportion to the growing power of the sun's rays, but in all cases avoiding a high night temperature. At this season, 60° is sufficient for those plants which are growing most actively. The necessary night temperature must be principally obtained by closing early, and so retaining the heat derived from the sun; and when fires are required, they must not be so strong as to render it necessary to admit currents of cold air. This must be used with greater caution than when the plants were in a dormant state, for the admission of a current of cold air during the development of the young growth will frequently give it a check, and so injure the tender foliage as to spoil the future appearance of the plant; a cold current of this description is very different from the moderate circulation of the air which is necessary in all plant houses. Select some of the strongest young plants of Carnations and Picotees, and pot them in soil consisting of three-fourths loam which has been charred for the purpose of destroying wireworms and other insects, and one-fourth thoroughly decomposed cow manure. During the summer all flower-stems should be picked out, the plants should be plunged in a bed of coal-ashes, and watered with clear liquid manure. After the end of August the stems should be carefully tied up as they make their appearance; and towards the end of October the plants should be taken up and placed near the glass in a frame or on the front of a greenhouse stage, where they will continue to flower a long time, and be much admired. Seedlings grown in pots and very liberally treated, will rarely fail to flower through the winter; and even single flowers are useful for bouquets and glasses.

FORCING DEPARTMENT.

Pineries.—With the advancing season, the temperature may be increased from 60° to 65° by night. Take advantage of fine weather to close with a sun heat of from 90° to 95°, and syringe freely all except those which are in blossom or ripening their fruit. Examine the state of the soil frequently, to see that it is sufficiently moist beneath the surface, as the frequent syringing will give a damp appearance without penetrating sufficiently deep to moisten the whole. Vineries.—Attend to disbudding, and thinning of bunches and berries in the successional houses, and make use of the syringe no longer than it can be done with propriety. We seldom give more than one good syringing after the fruit is set, merely to remove the remains of the blossom, as syringing is liable to injure the bloom, if used after the berries have attained any size. Peach-house.—During dull weather maintain a moderate temperature, with a rather dry atmosphere. In damp weather it will be necessary to keep up the day temperature with fire heat; and by

means of ample ventilation to allow free egress for evaporated moisture. Keep the green fly in check by fumigating, if the ordinary syringing of the house proves insufficient. FIG-HOUSE.—Figs require an abundance of air, with free exposure to the light; and without these, a plentiful crop of good fruit need not be hoped for. A moist atmosphere, and a liberal supply of water to the roots are also essential; and if the roots are confined within reasonable limits, every alternate watering during the swelling of the fruit should be of liquid manure. As the fruit begins to ripen, however, the atmosphere should be kept rather drier, to prevent its rotting; and in damp dull weather, sufficient fire heat should be used to permit the superabundant vapour to escape. Let the later successions be brought on gradually at first, in a temperature by night of from 50° to 55°. MELON PITS.—Excessive moisture must be carefully avoided during the setting of these crops; and as it is an easy matter to thin the fruit after all danger of damping is over, it is a good plan to allow more to set than will be ultimately wanted. Remove the blossoms as soon as they fade, and do not allow more male blossoms to expand than are required, as they tend to weaken the energies of the plant. Some seeds should now be sown of some of the best kinds for preserving. The adaptability of any kind for this purpose depends upon the colour of the flesh; the kinds most approved of are "the old scarlet fleshed rock," and the "Dampsha." The flesh of the latter is of a very deep green, and besides answering for preserviug purposes, it is very useful for dessert, and more particularly so, as it is one of the latest and best keeping Melons we have seen. It keeps till Christmas.

FLOWER GARDEN AND SHRUBBERIES.

It is a good plan to sow Convolvulus major, Tropæolum canariense, and some other half-hardy climbing annuals, in a frame, in such a manner that they can be easily removed to their permanent situations at the usual season. The best method is to lay some turves into a frame, with the grassy side downwards. After beating them till quite flat, the seeds should be pressed into the smooth surface, 2 to 4 inches apart, and then covered with a little light soil. When ready for moving to the borders, cut the turves with an edging-iron into small squares, containing one, two, or more plants in each. In this way they will experience little or no check, and will start into the new soil with much greater freedom than if they had been confined in pots. Sunflowers may be treated in the same way, as they do not like transplanting; and it is desirable to get them into flower as early as possible. As soon as the Primroses and others of the Polyanthus family have done blooming, they should be removed from the beds, of which they have lately been the ornament, that the ground may be prepared for the summer beauties. The plants which are taken up should be parted and planted in some nice loamy soil in the reserve garden, watered, and shaded with evergreen branches till their roots are re-established; in this situation they will prepare themselves for a repetition of their duties next spring. Those who do not possess a stock of these useful plants cannot commence at a better time. Seeds should be sown in the reserve garden of Hollyhocks, Dianthus, and other biennials; and also of perennials, especially of those kinds which flower the first season; some of the latter may be sown at once in suitable situations, where they may remain.

KITCHEN GARDEN.

Cardoon seeds should now be sown in 3-inch pots, two seeds in each, and plunged near the glass in a close cool frame; the advantage of this method of raising them, over sowing the seeds in the open air, is in the facility which the former affords at planting season, inasmuch as the plants can be arranged according to their sizes, and at the same time all blanks can be avoided. The old method involved considerable difficulty in earthing up, as it frequently happened that a very strong plant grew by the side of a very weak one, and to make the best of the former, the latter was inevitably buried. Parsley should be sown in drills about 12 inches apart, into which a few seeds should be dropped at intervals of 6 inches. The object in view is to remove all excepting the best plants in each patch, as soon as the curl is distinguishable; as those which are left increase in size, every alternate plant should be removed as they are wanted for use, and the ground forked between the remaining plants, to encourage their growth, and so to prevent their running to seed. Soot is a suitable manure for this herb, and is particularly useful in preventing or destroying the maggots by which this plant is so liable to be attacked. Where there is a large quantity of the spring crop of Broccoli still unused, the later heads should be selected and laid in under the shade of a north wall; and to shorten the interval between the last of them and the earliest Cauliflowers, the latter should be stimulated by frequent applications of liquid manure.

HARDY FRUIT GARDEN.

After removing the superfluous shoots of Apricots, the remaining ones should be carefully examined in search of the green caterpillar, which not only injures the young leaves, but, after eating holes in the young fruit, causes it to gum and grow deformed, or to fall off before it is stoned. The surest method of destroying these pests is by gently pressing the leaves in which they are lodged between the thumb and finger, after which the trees should be washed with clean water from the engine. After the fruit is set, more is to be feared from the ravages of the caterpillar than from either frosts or storms. It is an old adage that prevention is better than cure, and to few things does it more truly apply than to the destruction of wasps. At this season every existing wasp is about forming a nest, of which she will become the parent; and if these parents are destroyed, before they have had time to rear the first of their young ones, as a matter of course their innumerable progeny are destroyed along with them. Much loss of fruit will be prevented by offering a penny a head for every wasp caught before a certain date, according to the locality, from the 20th of May to the 1st of June. The distance must of course be limited; but as a large fruit garden is a great attraction, a two mile circuit will not be too much in a general way.

State of the Weather near London, for the week ending April 11, 1850, as observed at the Horticultural Garden, Chiswick.

April.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 17th 1844—therm. 71 deg.; and the lowest on the 16th, 1817—therm. 20 deg.

Notices to Correspondents.

INSECTS: *Onoma, &c.* 1, Philonthus aterrimus; 2, Aphodius sphacelatus; 3, Philonthus æratus; 4 (?), but without a number, Quedrus picicornis? (No No. 5); 6, Xantholinus glabratus, Grav. (Gyrohypnus cruentatus, Spry); 7, Cis Boleti; all the commonest of the common, and, except the last, unconnected with the objects of our publication, to which in future be pleased to restrict the species sent for determination. *W.—G A.* Westwood's "Entomologist's Text Book" will suit you. It is almost impossible to determine an insect by its chrysalis, except in marked cases. The young cockroach which attacks Orchids resembles the perfect insect of the common species, except that it is smaller, wants wings, and is wider in proportion. It is not necessary to dip insects in spirits before placing them in the cabinet. *W.—Northumbriensis.* From your description we suppose the insects found in your Melon frame to be some species of spring-tailed insect (Podura) which attack decaying or ailing vegetables, and which have most probably been introduced with the manure. The earth should be well moistened with gas tar water, and the plants repotted in fresh soil. *W.—L B S.* See the preceding answer to Northumbriensis. *W.—Vernon.* We cannot supply answers to conundrums in the "Family Herald." *W.—W D S.* The small "bugs" in the crevices of the diseased Rose bark are a minute species of bark mite

(see *Gard. Chron.* 1843, p. 356). Fig. 1 is part of a branch with the mites clustered together, of the natural size; 2, one of them removed; and 3, do., magnified. We do not think that they were the cause of the wound, but they will certainly aggravate it. Wash the part with strong soapsuds and lime. *W.—T V.* The grubs which have destroyed

your Wheat crop are the larvæ of a species of Tipula or daddy-long-legs, most probably T. maculosa (see *Gard. Chron.* of 1846, page 317); 1 is the grub; 2, its tail, magnified; 3, its pupa or chrysalis; and 4, the perfect fly. Your field should be turned up, and a lot of ducks driven after the spade or plough. This, with a strong watering of gas-tar water, will get rid of a great number, but children should be employed to catch and destroy the flies when they appear. *W.—J H S.* The insects sent with the sprig of Honeysuckle are so minute and shrivelled up that we cannot make out what they are, but suppose them to be aphides. Unnail the plants from the wall, and enclose each in a close bag, within which tobacco smoke should be introduced. If properly done, this will destroy the young aphides. *W.—B A.* No. 1, Anisopteryx leucophearia; 2, Cheimatobia brumata; 3, Acidalia lactata; 4, Cidaria ferrugata; 5, Lozogramma petraria; 6, Margaritia prunalis; 7, Emmelesia albulata; 8, Diurnea Fagi. All very common. *W.—E T F.* Dermestes lardarius crushed to pieces. Specimens for identification, and especially living ones, should be packed so as not to be injured in the transit. We know no other way of preventing the attacks of this insect than by killing the grubs, and especially the beetles, as soon as they make their appearance in the perfect state, for which a sharp look out must be kept. *W.*

AMERICAN ALOE: *Flos.* Clean off the tar thoroughly; take it out of its soil, and cut away all *dead* roots. Then repot it in rich loose soil, well drained, and plunge the pot in a hot-bed, where it may remain, shut up close, till it has made young leaves. As soon as these are 3 inches long, give air gradually, and when they are hardened and full 6 inches long, expose it more and more to the open air. If there is any life in it, this process will revive it.

BOOKS: *A Constant Reader.* Probably Babington's "Manual of British Plants" will suit you, but it contains no plates. If you want *them* you had better buy Vol. I. of the cheap edition of Sowerby's "English Botany."—*A M.* "Glendinning on the Pine-apple." Sheet glass will burn; use rough plate.‡

MANURE: *Sub.* The best thing to mix with garden refuse, such as leaves, the Grass mown from a lawn, &c., so as to cause them to decompose and become fit for manure, is the ammoniacal liquor of the gas works, if you can procure it.‡

NAMES OF PLANTS: *Constant Sub.* It is a Jew's-ear Fungus (Exidia Auricula Judæ), a very curious Tremella-like thing, not rare on old trees.—*M C.* Oncidium longipes; it will be published in the next Number of "Paxton's Flower Garden." *W G.* Saxifraga oppositifolia.—*A E N.* Tecoma australis.—*W P.* Aponogeton distachyon.—*Enquirer.* Hippeastrum Johnsoni; the rest next week. Thanks for the Phaius.—*A E.* Sutherlandia frutescens.

RATS: *B.* Since you cannot poison them, the only remedy you have left is to trap them, or kill them by means of ferrets. In baiting the traps do not touch the bait with a knife, a fork, or the hand. If you do, all will be vain; their sense of smell being extremely delicate, their suspicions will be aroused, and they will avoid the stratagem.‡

SAP: *Enquirer.* The buds placed on the topmost parts of a tree are first developed in the spring because they are youngest, whilst those buds that are situated in the lowest parts of the same tree, being older, are at the same time but slightly affected. The separate memorandum is founded upon a misconception of well ascertained and undoubted facts. Both gaseous and fluid matters pass *freely* in all directions in the interior of the young parts of plants.

SEAKALE: *Sub.* To be flooded two or three times during the year will not injure Seakale, provided the water does not stagnate about it. Both Seakale and Asparagus would be benefited rather than injured by such floodings, the soil being an alluvial loam.‡

TANNERS' BARK: *Adolescentulus.* This, in its manufacturing state, is unfit for cultivators to use; but when exhausted of its tannin, and allowed to decay, it ceases to be "tanners' bark," and becomes, like all other decaying vegetable substances, valuable to the cultivator in proportion to its degree of decay. The worst way of using it is to burn it to ashes; the best way is to *char* it. Whether charred or merely decayed, it should be mixed with putrifying matters, such as the contents of cesspools, or rotten dung, and also earth or any other common material, *except lime.* It then becomes one of the most valuable of all manures.

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

WIRING WALL TREES: *E T C.* In erecting a new garden wall, it is not necessary that the studs for wires should be built into it, as they can be driven in afterwards with much less trouble. They should, however, be inserted before the mortar has set hard, as cast-iron studs will then drive easily, and are much cheaper than wrought-iron ones. If the mortar is good, and allowed to set very firm, there is some loss in using the cast-iron nails, as they are liable to break in driving. With regard to the different modes of wiring, the horizontal one is to be preferred for fruit trees; the vertical wires are better adapted for climbing plants. The semi-circular arrangement may look very well on paper, but to make it answer on the wall, a much stronger wire and a very large quantity of studs are necessary, and even then the wires are liable to be continually displaced. But why use wires at all? It is an additional expense without affording any compensating advantage. We would recommend in preference the system described at p. 435, of the volume for 1849, by Mr. Fleming, which is simply driving common cast-iron wall nails or studs, 5 or 6 inches asunder, over the entire surface of the walls, and to these the trees are secured by bast. Every facility is afforded by this method for neat and expeditious training, and the appearance of the studs even on the uncovered portions of the wall is much more agreeable and ornamental than wires would be. Studs are very cheap; they cost only 1½*d.* per lb., and they are as permanent as wires. For further particulars, together with a discussion of the various modes of securing trees to walls, and the relative cost of each, we beg to refer you to the page above quoted.‡

MISC: *A M.* Messrs. Youell, Great Yarmouth. A west aspect will answer for a greenhouse. Soot may be used with advantage in a kitchen-garden; and so may guano; but they will not enable you to dispense with farm-yard manure.‡—*A C S.* It will not harm a Hardenbergia to prune it in after flowering. For an answer to your other question we must refer you to previous advertisements.‡

SEEDLING FLOWERS.

CINERARIAS: *W H H.* 1, purplish crimson, texture and colour good, outline thin, size small; 2, deep purple, texture good, size and shape middling; 3, purple, petals narrow, outline bad, size too small.*—*J P.* 1, white centre, with deep rosy purple edge, good in texture, colours, and shape, but very much too small; 2, violet with a white centre, too small; 3, very like the last in colour, but a little larger in size; 4, deep blue, white centre, bright in colour, but very small; 5, light blue fading to white in the centre, texture good, but too small; 6, bright crimson, good in texture and colour, but too small. All your Cinerarias are very good in texture and colour, but far below the standard in size.*

EPIPHYLLUM ROSEUM GRANDIFLORUM: *R W.* Colour bright rosy red, slightly marbled; size good for its class of hybrids; a nice distinct variety.*

PANSIES: *T O G.* A large bold flower, striking in colours, and having a rich eye, but coarse, and the eye runs into the margin too often. Two of the blooms out of the three have this fault.

ERRATA: GARDEN WALKS.—In the last Number, p. 212, 3d col., 40th line from the beginning of the article, for "gardener," read "garden;" and at the 4th line from the bottom of the same column, for "corner" read "former."

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, April 13.

SUPERPHOSPHATE OF LIME, GUANO, CRUSHED BONES, and all other artificial MANURES, at Messrs. HUNTS' Bone Mills and Manure Works, High-street, Lambeth, London. Established 1816.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for Gardens, 1*s.* 2*d.* each. Patent Fumigation, for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12*s.* to 13*s.* per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, April 17—Agricultural Society of England.
THURSDAY, — 18—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 24—Agricultural Society of England.
THURSDAY, — 25—Agricultural Imp. Society of Ireland.

MR. PAGAN'S plan of ROAD REFORM, to which we referred last week, involves the abolition of the toll-bar system, and the substitution for it of a poll-tax on horses. The former method of raising the funds for road maintenance is extravagantly expensive. In Fife and Kinross-shires it is said the amount annually needed for the maintenance of existing roads does not exceed 18,000*l.*—producible by a tax of less than 30*s.* a-head on the horses within these counties, and which might be collected as other taxes are with the assistance of means already in operation; while, as the thing now stands, the real cost to the public of these roads amounts to 33,000*l.* annually, 15,000*l.* being lost in the expenses of collection. Fivepence is thus wasted in collecting every 6*d.* that is usefully spent. We need not repeat, what we have already pointed out in our volume for 1846, how the two methods of road maintenance differ also in their influence upon industry; the one, a proportionate tax, increasing if *it* offer to increase, and thus keeping it down to the lowest possible point; the other, a fixed annual payment, the same whether the animals taxed be at work or not, and thus a direct bonus upon their employment. All this is well pointed out in Mr. PAGAN's work on the subject,* which, though published and widely circulated three years ago, again deserves general attention now that road management is about to be made the subject of legislation.

The following are facts illustrative of the mode in which this gentleman's plans would act in particular districts. "As regards Scoonie and Logie, two parishes in the county of Fife, nearly of equal extent —Scoonie containing 3855, and Logie 3343 acres; —the first containing a burgh and post-town, with considerable manufactories, and a population of 2640, its surface being traversed by turnpike and statute labour roads, and closely hemmed in by turnpike bars; the latter an agricultural parish, with only a very small village, a population of 410, and no turnpike roads. The present taxation paid by the inhabitants for the maintenance of the roads, whether in the name of toll-dues or statute labour conversion money (at 36*s.* per 'plough-gate'), is estimated in Scoonie at 537*l.* 4*s.* 3*d.*; in Logie at 120*l.* 13*s.* 11½*d.* The ascertained number of horses is—in Scoonie, 161; in Logie, 75. A tax, therefore, on horses, according to Mr. PAGAN's scheme, to meet the *present* expenditure for upholding the roads would be, per horse, in Scoonie, 3*l.* 7*s.*; in Logie, 1*l.* 12*s.* 2*d.* From a rate laid on the real rental of all property for the same purpose, it would amount, per pound sterling of annual value, in Scoonie to 1*s.* 2½*d.*; in Logie to 8*d.* It must, however, be borne in mind that the real rate would, in either case, be much less (probably two-thirds), from the saving in the expense of management, which Mr. PAGAN clearly proves may be effected."—All this is reported by a committee to the trustees of the county. The report, from which it is extracted, concludes, however, without sanctioning Mr. PAGAN's scheme, observing that the difficulty "in respect to a general measure of change in that county is greatly increased by the circumstance of its being divided into four districts, having different amounts of debt, and whose separate powers in respect to the management of the funds are absolute."

Now for the facts regarding Forfarshire. In a report upon that county, as regards the management of its roads, Mr. PAGAN shows that out of the 13,000*l.* levied at toll-bars, 3500*l.* are spent in the mere process of collection. The 4000*l.*, within which the whole expenses of management at present fall, might be reduced nearly to 1100*l.* under Mr. PAGAN's plan; and all the funds needed on the roads of that county might be provided by a tax of 29*s.* per horse on the 10,000 horses it is estimated to contain. And the following grounds for believing that this tax might ultimately be considerably reduced are given in detail, as there is not a county where they may not be expected to be equally influential:

"1. The projected railways through the county will have the effect of relieving the roads of all thorough traffic, so that in future they will be kept up at a much less cost, for the sole use and at the sole expense of the county.

"2. On the abolition of toll-bars, there will be no inducement to use circuitous routes. People will, in every instance, drive by the nearest and most direct road, and so diminish the tear and wear attendant on the circuitous driving which results from the present system.

"3. The public money will go farther when applied under the direction and responsible management of a County Roads Board, with the county divided into a few districts, than under the present system, with 70 separate sets of managers and paymasters.

"4. From the roads being thrown open by the abolition of tolls, as well as from the wants of an increasing population and the progress of improvement throughout the county, an increase in the number of horses may reasonably be expected. Whenever the number of horses rises to 12,000, a rate of 22*s.* 6*d.* would produce the funds required; and, when clear of debt, at the end of 31 years, the rate would fall to 14*s.* 6*d.*"

We add the following particulars, illustrative of the subject, which are true, of a Union in the county of Gloucester containing 36,000 acres. The population of the district is 38,000. It contains 960 horses. There are 80 miles of roads, under no fewer than 16 turnpike trusts within it; and it contains 180 miles of highways supported by parish assessments. There are nearly 40 toll-houses within the limits of the district. The tolls collected, if put at 20 per cent. over the actual sums received from toll-collectors, amounts to 3960*l.*; while the actual cost of the turnpike roads is not more than 2000*l.* annually. This refers to the 80 miles of roads under different trusts within the district. As regards the 180 miles of highways, the amount raised by rates is 1700*l.*, of which 300*l.* are paid as contributions to the turnpike-roads: the annual cost of the highways is 1200*l.*, and the expenses of administration about 300*l.* Now whatever method of raising the funds for road maintenance be adopted, it seems clear that the extravagant method of toll collection must be given up. Mr. PAGAN's mode of taxing horses would, as might be expected in the case of so thickly populated and so "industrious" a neighbourhood, fall heavily enough upon the farmers, while the carriers and others whose horses are constantly on the road, would benefit by it; but inasmuch as a large portion of the funds collected as at present are derived from thorough traffic, there seems justice in the proposal to widen the districts, within which the tax would be uniform, to make it, in short, a county tax, rather than that every union should maintain its own roads: and this would take the burden somewhat off districts such as that referred to, which may be considered as the foci of intercommunication. No doubt the burden would in the same proportion be thrown upon the purely agricultural districts; and out of this most of the objections to Mr. PAGAN's method of road reform have arisen: but it is forgotten that however, relatively, certain districts might benefit more than others—*all* would probably benefit to some extent, as, the present outrageously extravagant system being stopped, a very large reduction would be effected in the expenditure. Thus Mr. PAGAN was at the trouble to ascertain the actual expenditure on the roads by the owners of 286 horses, and it was found to amount to at least 2*l.* 2*s.* 6*d.* per horse in a district where, under his system, a direct tax of about 30*s.* would have sufficed. And we have no doubt that the same fact would hold true in degree of all other districts whatever, and that under the proposed system no greater inequalities of taxation would exist than at present occur under a system of far greater expense to all concerned.

* "Road Reform," &c. By WILLIAM PAGAN, &c. BLACKWOOD and SONS.

CHRONICLES OF A CLAY FARM.

SECOND SERIES.—No. VII.

AMONG the various experiences which the much more social Agriculture of the last twenty years has brought, (for a great change has come over us in that particular since—well—never mind how long ago I was going to say,—) there is none which has struck me more than that part of its philosophy which consists in the operation of mind *upon mind*. That of 'mind upon matter' is not a very new subject: we see it every day, —and hear of it too, till it is something tiresome: just now we are on a different theme, and a less trodden: 'mind upon mind' is our point at present, and perhaps the more important, after all, of the two. I was going to say that in a pretty long and intimate experience of a rather curious soil to deal with, and to which never did man, horse, or implement, deny the epithet 'stiff,' I too, like them, have had my own dumb reflections, and not the least emphatic of these have grown out of the everyday phenomena of mind acting upon mind. You tell a man something, to-day, or express an opinion,

or assert a fact, about a thing which he has perhaps never noticed, or never heard, before: he smiles, starts, shakes his head, or delivers himself in some other way, for the ways are various in which men 'behave' (as the chemists call it) under the impregnation of a new idea. Whatever the mode may be, one thing you may be sure of, that in the grunt, the smile, the laugh perhaps, in fact whatever it may be that meets you, the attitude of mind betokened is that of—*dissent*. I am far from complaining of it: some of my best hands have given me infinitely the most mental gravelling in this respect. But what I *do* complain of, and want to know where to apply for remedy, (since the Law tells us that for every Wrong there lies one)—is that these same hard-headed fellows, workmen, neighbours, friends, kind advisers, or whatever other relation they may hold,—six, twelve, or eighteen months afterwards, coolly come to me, and with all that air of profound thought that becomes a man of reflective character, down-calving as one may say with something intensely wise, announce to me in new language of their own, the very thing which I at such time back suffered a small martyrdom in the vain endeavour to urge *upon them*.

I know not whether other 'employers of labour' have felt this sort of *paulo post* experience as I have done. But I suspect so; for every man is (and it is comforting to think so) only the unit of *a class*. It is difficult to study for successive years the character of a soil, without learning something of the character of those employed upon, aye and even of those who *visit*, it. And this has been my especial grievance, and one which Time, the 'smooth-handed god' has increased, not lightened. People who derided my 'improvements,' laughed at my 'deep' drains, bewept my grubbed-up Ash-stumps, mourned over my obliterated hedgerows, turned up noses at my Tank, listened with mock-gravity to my 'mysterious' remarks about the 'economy of warmth' as cheaper than the 'equivalent in food,'—and a great many other things that it would take an inventory to tell,—do now come and preach to me such admirable sermons on my own poor old antiquated texts, that I should really begin, as other worthies have done before me, to doubt my own identity,—but for a little store laid by in a corner, of the capital I began with, and which I commend again to all *beginners*—namely, of philosophy.

"The mind," says an old author, "like the body, must digest before it can assimilate. The hungry dog bites your fingers as he takes your morsel: but the food becomes flesh, and the want is forgotten,—with the giver."

And so I have found it: and so, no doubt, have others. No sooner is a new thought imparted, than it sets up for itself, and denies its pedigree. "Why, that is exactly what I told you three years ago, when you came—&c.——!" you feel on the point of rapping out, struck with severe amazement.

Spare your breath! and your reproach. He cannot remember anything but what he *now knows*. He forgets that he ever thought otherwise! Tell him, *now*, something new, and you will see again the same derisive smile, the same look of idle wonder, aye of contempt, at your fanciful, ideal, 'theoretic' notions: and twice twelvemonths hence, when your idea has *taken root* and become a fact, the scene of to-day will be acted over again. Then go to your library,—large or small,—and look back over the history of the world; and you will see that the annals of human invention and discovery are the true history of Martyrdom, and that to be stoned by his own generation, and worshipped by the next, is at once the penalty of human pioneership, and the reiterated monument of human folly, dotting the road, like milestones.

It is very fine, no doubt, to connect one's own small-scale improvements, after this fashion, with the history of the Great and the Dead, to whom life was one conflict with ridicule and contempt—a history the most affectingly interesting—perhaps the most important that is left to us;—but after all, the grandeur or pettiness of the scale does not alter the argument. And when I had listened for half an hour to Mr. Greening discoursing of Guano and Superphosphate, in as easy and as matter-of-fact a style as if he had regularly carted them out of his Farm-yard on to the Turnips any time this fifty years, (though he still called it Gu-anner, and *would not* have it at any price as a word of two syllables,) I could not help mentally amusing myself with thinking of the time when he used to poke every imaginable jocularity at me for '*sowing the saw-dust*,' 'wheel-barrow farming,' 'pocket-dung-carts,' and a whole heap of good sayings which, duly noted down on my part, made my chronicle of that date a complete glossary of farming-witticisms: and curious it was to see how the memory of former incredulities had passed away *from him*. My deepest drains were no longer deep; my largest fields no longer 'to' big for the farm.' But Greening was a true improver notwithstanding. He baptized every new-born notion with a jest, but he watched its growth and adopted each youngster in succession, and so heartily and practically withal, that they seldom got into his hands without thriving better after all than they had done in mine.

Ye ardent Go-aheads! who expect every new argument to *tell* at once,—every intellect to yield at the first onset, every new plan to be tried by every body,—learn to *wait:* and you will find that there is much more chance of your notion being over*taken* than over-*looked*, much more likelihood of your having to re-*claim* than to re-*assert* a single hint that was ever good for anything. The seed may seem a long time buried, but if it have any vitality in it, it is germinating where you little think, and will fructify when you least expect, and with a produce you had never dreamt of. And when you come again and say 'this is *mine!*' do not be surprised if shouts of louder laughter greet you than even befel your first announcement of it.

I had time to think all this: for my guest, like a shrewd bargainer, as he was, gave a little fling to the general discourse before he came to business. In fact he had the true diplomatic tact of always making the business come of itself. "Well then! Here's 'Better Prices for 'thirty-six'! and that 's with all my heart, *and* no mistake," said he, 'topping up' with a final cup of Coffee that healthiest and purest of mortal meals, a plain but hearty breakfast. "And now, sir,—when are we to see 'em!" he added, giving his chair a shove sideways, slapping his hands on his knees, and facing me, like a lion refreshed: "for it 's my notion we never shall again!"

"And then——?"

"Why the farmers 'll be ruined, and the land 'll go out of cultivation."

"And the Landlords——?"

"Will follow, of course. They depend upon the Farmers, and the Farmers on the land."

"And the land on the price of Wheat?"

"Surely."

"Tell me this, Greening, have rents risen or fallen since the War?"

"Risen, certainly; and too much, to my thinking."

"And the price of Wheat has been falling: from eighty or ninety shillings a quarter to forty or fifty, as we remarked this morning. Rents rising, and prices falling!"

"Yes: and the farmer's business getting worse every year. 'Tisn 't like what it used to be."

"Just so! and competition keeping up the rents notwithstanding!"

"Aye! that Competition! It didn't use to be so. And what is it after all? No sooner a Farm's vacant than a hundred fellows come yelping after it like a pack-o'-fox-hounds, offering a high rent, and not one of 'em perhaps with the valye of a team o' horses of his own, scarce: and when they get in what do they do? Crop every field that 'll bear a crop, sell all off for a few years, and then leave it clean beggared, and the landlord without his last year's rent p'raps."

"No Turnips—they *take no root*, Greening!"

"Turnips! they 've no stock to give 'em to! What 's the use o' them growing Turnips? that 's not their *sort* o' business."

"And they outbid the honest cultivator, and the skilful one: in fact they can afford to do so, because they can afford to rob: just as though a man offered you a higher rent for your house, meaning to sell off the furniture?"

"That 's just it: that 's just what it is, sure*ly*."

"And the higher the price Wheat is kept at, the better it pays,—the greater the premium, in fact, on that kind of 'farming.'—the higher the sham-rents offered over the head of the fair tenant,—the smaller the inducement to steady and fair cultivation,—the greater the breadth of Wheat unfairly grown,—the greater the consequent glut upon the corn-market, and the injury done to the honest grower who has earned one large grain-crop by growing roots and feeding plenty of stock, instead of raking the land by frequent and diminishing crops with no stock at all. Is that to your liking? Will you pray that the inducement may continue of that style of farming? of *that* style of *competition*? of that style of rent-raising, that ends in ruin to the beggared land, the ignorant landlord, the foolish tenant, and the defrauded laborer?"

Mr. Greening looked thoughtful,—"Well—there's something in that, perhaps; but how 's it to be stopped? How 's them sort o' *farmers* to be put an end to?"

Now it was the other's turn to be a lion. So the savage beast sat right opposite to poor Greening, and glaring fiercely in his face growled out—"Now look at me like a man—don't faint—and I 'll tell you.—By serving them as you do the Rats when you take the Ricks away! Starving 'em out! There 's no *other* way! They 'll starve you if you don't starve them. Their food—their only food is—ever has been—the *premium* price—the *disproportionate* value of the grain-crop. TAKE AWAY THAT BAUBLE!" quoth farmer Oliver—the *Protector*.

There was an 'awful pause.' Mr. Greening was looking into the fire. One would think there was something written in the live embers which he was trying in vain to decypher—So hard he looked at it.—"Ah! I've thought o' that!" he slowly muttered at last, as if to himself:—"Kill or cure! But that's 'kill first and cure afterwards.'"

"Kill the proud-flesh, to cure the sound. Yes: cruel work, no doubt, at any time; but crueller when done at the wrong one."

"When's that?"

"The moment when it *will* be done; as surely as effect follows cause! Does it need a ghost to tell us that that time will be a time of *scarcity*—a famine perhaps, or a fancied one? *Then* it will be done, and done *in a hurry too*! And then——What comes after a famine, Greening? What is the recoil of Scarcity?—*Abundance*—very true:—*then* will be the tug of war, then! for good and bad together. 'A cruel brute, this Lion,' we shall say! and yet he pastures on the cruellest of all: he cracks the bones of the true bloodsuckers; and 'when it's bad weather for thieves,' they say, 'the true man may sleep the sounder,' let the rain rattle on *his* corn-stack how it may. 'Let Mr. Lion roar again,' you will say, when you've seen the end. Even your tiny Mole is a ruthless beast of the field—to slugs, and snails, and caterpillars, and such land-sucking fry—a fierce subnavigator, in his way: but his track turns up some pretty cultivation; it only wants *spreading*,—far and wide! it's not so wise to throttle him as you think. I grieve to see him hanging gibbeted—his clever paddles stopt, by cruel ignorance. For he is your only granulation-master; he taught us drainage—and *sub*-cultivation—and we shall learn of him another, and a greater lesson, some day, and call him a prophet—when we've done hanging him—and have got some speculation in our own eyes (whose sense is shut at present), instead of saying *he* can't *see*. Day and Night! HE has the better right to say so of us!—But as for this price-of-corn question—this grain crop *versus Green crop*—trust me, Nature has her true *Proportions*—and is pretty rigorous in maintaining them: and you cannot throw them out of gear, but she 'll be down upon you, somewhere. *Green-crop versus Grain-crop!* Which would you shew favour to, if either? the man that comes to *make* an investment—to *earn* a crop, knowing the cost, or the spoiler that comes to *take* one, counting nothing?—him that comes to sow before he reaps, or him that comes to reap before he sows? Do you remember what I said about 'Grace before meat.'"

"Yes, yes! I remember it, I 've thought of it too, though I never did in that way 'xactly before.—I see your meaning, now. But—but—about the—What was it you said about *the Rents?*"

"Ah! the core! the vital point—is n't it? touch it tenderly for the life of you!"

"But will they fall?"

"Will they *stop rising* a bit? Catch that fish first. Get *him* well on the hook: land him carefully; and you won't have quite an empty basket, I can tell you. I'm NOT sure if it won't take care of itself afterwards. Which farm pays the *best* rent, even now, the one where the *highest* was *promised*—or *the other?*"

Mr. Greening drew in his lips and shook his head. "Let the Landlords answer that. 'Taint all gold that glitters.'"

"True: so for those that ca'nt distinguish, *a pure currency* were the greater blessing, eh?"

"There 'll be less *of it*, I 'm thinking," said Mr. Greening, "if it comes to that. But that aint all. There's them Clay Siles. We haven't done with them yet."

"We haven't *begun* with 'em! Come, I 'm out of breath. 'After breakfast sit awhile,'—we mustn't ride the old maxim to death. Let's go and *look at them:* I can give you your choice—Red, blue, yellow and white, and every one with a different temper for every month of the year! The man that can tell what *is* to be done with them—"

"He 's the '*coming* man,' I suppose," said Mr. Greening, laughing, and beginning to pull on his great-coat; "he must be able to mix Fire and Water first, I 'm thinking!"

"And make STEAM?"—said the other.

Mr. Greening turned short round at the answer, as he was going to the door, and looked a moment fixedly at the speaker. Both smiled: but there was a difference in the smiles. And they walked out together.

Talpa.

THE CONDITION OF THE LABOURER ON THE DUKE OF RICHMOND'S ESTATE, HUNTLY, ABERDEEN.

THE condition of the labourer at present, in this part of the north, is prosperous. The usual food is prepared with oatmeal, and at present rates, while the labourer is earning from 2*s.* to 2*s.* 4*d.* per day, the average price of the quantity of oatmeal which an able-bodied man could consume would be about 2*d.* per day; and work is in the meantime abundant, though it is impossible it can continue so unless a change of prices takes place. The high rate—11*s.* and 12*s.* a-week for men, and 10*d.* a day for female labourers—of wages is to be attributed, to a great extent, to the impulse given in this district to agricultural improvement by the Duke of Richmond. Within the last 10 years his Grace has expended in the Huntly division of his Scotch estates as follows:

1. On buildings	£7,000	
2. On enclosing...	4,700	
3. On drainage	6,400	
4. On miscellaneous improvements, such as roads to farm steadings, embankments, &c.	850	
	18,950	
5. On plantations	3,000	
		£21,950

The principle on which the aid in enclosing drainage and buildings has been afforded to the tenants is such that probably about half the expense falls to be borne by the tenant, and no interest is charged on the outlay; so that adding an equal outlay on the first four items of outlay, the total expenditure cannot be far short of 40,000*l.*, by far the greater proportion of which has been expended directly on labour.

These outlays are over and above the outlay of 5000*l.* in progress of expenditure on his Grace's lands in this district, under the provisions of the Drainage Act. Of this outlay the tenants bear no share, but they pay 5 per cent., in addition to their rents, on the amount expended on their respective farms.

Leases of 19 years are the usual rule throughout the country, where the farms are of any size, and in many cases even where the size is very inconsiderable. The

facilities for acquiring the ordinary branches of education are very considerable throughout the whole of Scotland, but especially throughout the northern counties, from the circumstance that several large bequests have have been left for educational purposes in these counties. These are sufficient to raise the salary of the schoolmaster to a very considerable amount (comparatively), independently of fees; and the allowance to each schoolmaster being graduated according to the number of his pupils, and their proficiency in the different branches taught, the interest of the teacher in the advancement of his scholars is secured. Besides these (the parish schools), there are few parishes in which there are not one or two side schools, supported mainly by small fees from the pupils, aided generally by salaries of small amount from the landlords, occasionally by bequests, and by grants from the funds of the Scotch church. In addition to these, a great number of schools, connected with other religious bodies, exist throughout the country, and are attended by a large proportion of the young.

With these educational facilities, there is hardly a labourer in the north who has not learned at least to read and write; and there are numbers who are quite fit to undertake situations of some considerable trust and responsibility, in which being able to write tolerably and a fair acquaintance with figures are indispensable. So much is this the case that the wages of an ordinary farm-servant, and of a servant who fills the situation of a *grieve* or overseer, and has charge of all the accounts, &c., differ to a very trifling extent; and there is no difficulty in getting persons employed as ordinary labourers, fitted for such charge.

There are no allotments expressly for the purpose of accommodating labourers in the district; but there are numerous small holdings, and the farm servants and labourers generally consist of the families of the occupants of these smaller possessions. The improvements before referred to have, of late years, introduced labourers from different quarters, of more migratory habits, who will no doubt leave this locality as work becomes less plenty here, or more abundant elsewhere. The number of these labourers, however, is comparatively small, the great majority being, as mentioned, children of small tenants of land; and they are themselves less desirous of pushing themselves forward as labourers than, after some years of service, of settling in crofts, and, in fact, of becoming little farmers. It must be obvious that without adopting the Irish system of subdivision, it would be impossible to make provision for settlements of this nature for any length of time. The present tendency is rather to unite possessions and to give employment to the class referred to as labourers, than to subdivide and convert them into cottars. Still great progress has not been made in the work of consolidation, as may be seen from the following statement:—On a property in this immediate neighbourhood, consisting of 200,000 arable acres, there are—

108	tenants paying a rent under	£5	0	0			
64	„ paying between ...	5	0	0	and £10	0	0
67	„ „ „ ...	10	0	0	and 20	0	0
82	„ „ „ ...	20	0	0	and 50	0	0
67	„ „ „ ...	50	0	0	and 100	0	0
38	„ „ „ ...	100	0	0	and 200	0	0
12	„ „ „ ...	200	0	0	and 300	0	0
	And only 1 tenant upwards of	300	0	0			

Besides these, there are scattered over the same property 183 occupants of cottages and gardens, paying rents varying from 1*s.* to 20*s.* yearly. These are for the most part persons who had settled at a former period in unoccupied corners on hill sides, without any authority and without any objection. The practice is not now permitted, but the parties already settled have been allowed to continue.

There are very few manufactures in any part of the north country, and in this locality none. And although there has for a considerable time been, and still is good employment for labouring men at high wages, women have sometimes great difficulty in earning anything, particularly in winter. In spring and summer and in harvest season they can find plenty of work at the wages above mentioned; but in winter they can get little or no outdoor work, and almost none indoors. In Scotland, able-bodied persons out of employment, if in health, have no claim to parochial relief; but of aged and infirm men the number on the poors' roll in this locality is very inconsiderable, as compared with the number of infirm women, perhaps in some degree owing to their want of steady employment. *James M'Donald, Huntly, Aberdeenshire.*

Home Correspondence.

Water Wheels.—The experience I have had in water machinery, makes me decidedly give the preference to vertical water wheels, for a situation like that of "*Aqua Pura*," [see page 203], and would recommend the wheel to be not less than 18 to 20 feet in diameter. The width of course must be calculated from the quantity of water you have at command; 3 or 4 feet wide will make a very powerful wheel sufficient for the requirements of a considerable farm, to cut straw, hay, gorse, and to thresh, crush Oats, Beans, &c., and churn; but all these will not be required at once, therefore the power sufficient to work a threshing machine will be sufficient. Light water wheels of 8 and 9 feet diameter, 2 feet wide, wrought-iron axle, cast-iron sockets, the remainder all Pine or American deal wood, are made here for about 10*l.*, fixing extra, and one 14 feet of the same material, was made for 15*l.* These answer for cutting gorse, straw, &c., and churning, and with a good supply of water, may turn a small threshing machine, but are not to be recommended (the small ones). The greater diameter gives a greater leverage, and consequently greater power, although the perpendicular fall of water be the same. To a person who could superintend the fixing of the machinery, it would not be very expensive. A common straw cutter and threshing machine on the ground floor, attached to the water wheel, one on each side, by spur or bevel gear, and giving to each the requisite speed in the diameter of the wheels; a pair of old mill stones, fixed in the floor above, and turned by the upper side of the spur wheel, on the axis of the water wheel; thus each can be worked separately, by providing slides to move the pinion, or all together, if power enough, and occasion require. *T. S.*

Farming in 1850.—Being too old to learn new ways and contend with the difficulties of the times, I have retired from agricultural pursuits; but not liking to be a mere idle looker-on, I wish to make myself useful by writing a few remarks for the consideration of those who are busily engaged in the battle of life. Farming in 1850 must be very different from what it was 50 years ago. It will not now do to reap only two middling crops in three years, the third year having a dead fallow. Neither will it do to go on cultivating wet land; it must either be well drained or thrown out of cultivation; nor will it do to be satisfied with middling crops. The cultivation and condition of the land must now be such as will bring great crops; but, to effect this, it is requisite that the farmer should have a large capital; and, to induce him to lay it out freely, he must have security for remuneration, and payment for improvement. The present time is a crisis, requiring prompt and judicious consideration, and the active energy of land-agents and landowners as well as tenant-farmers. Many of the latter are thinking of emigrating, as they reckon it a hopeless task to endeavour to compete with the foreigner, while they are themselves bound hand and foot, oppresssed by war-time rents and taxes, and, in too many cases, their crops devoured by game, which they are bound to protect. If, therefore, the owners of land would avert the disastrous consequences of having their farms thrown into ruinous condition, and then cast upon them—and if they would deprecate the abduction of capital, skill, and enterprise, which will otherwise take place—let them immediately make such arrangements as will prevent the ruinous consequences which such neglect will certainly bring upon themselves and this nation. Corn-rents on tillage farms, the destruction of the vermin called game, long or renewable leases, with payment for all unexhausted improvements, and liberty to make the most of the land without injuring, but with every encouragement to improve it as much as possible, appear to me to be the indispensable requisites; and with these, and a moderate reduction of rent, I hope the British farmer may yet be spared the pain of banishment from his native soil. *An Old Farmer.*

Logic and Liberality.—What a queer world is this we live in, and how strange that every effort to mend it is sure to be met with determined opposition from some quarter or other, but chiefly from the ranks of ignorance, selfishness, and "Suspicion!" I have not been more amused for a long time than by the efforts of certain writers to throw odium on the means adopted by the *Agricultural Gazette* to elicit information on a subject, important at all times, but doubly important in times like the present; that of the relative connection between the position of the employer and the employed, with a view mainly to the amelioration of the latter, but ultimately, perhaps, to the advantage of both. Amongst the foremost in his opposition to inquiry on this interesting question, is a certain scribe, who rejoices in the cognomen of "Suspicion," (a more appropriate title he could not have hit upon), who puts forth a manifesto, by way of warning, to the cultivators of the soil, how they give the remotest sanction or encouragement to the list of queries propounded by you, the very Guy Fawkes of free trade editors. In the eyes of "Suspicion" the whole thing is a vile plot to undermine the agricultural interest, and the smattering of chemical knowledge he has acquired, authorises him to pronounce it an explosive mixture, destined to blow up the whole system, both of protection and agriculture; terms which, in his vocabulary, are strictly and completely identical. One gentleman, who is and shall be nameless, issues the very alarming mandate to those who have received the list of queries, "Do not reply to them!" King Canute once issued a similar command to the waves of the sea, not to come near his gouty toes: but they did come notwithstanding, and the royal toes suffered in consequence—and the courtiers who advised the absurd decree were rebuked, as they deserved to be, for a set of rogues and fools. Just so now. The wave will roll in, and the answers to your queries will be borne with it—the result will be published, and the whole will form a valuable repertory of information on a subject, as I have already said, of the gravest importance both to the farmer and the labourer. As one who was honoured with the receipt of a copy of your list of queries, I feel myself bound to state the course I pursued on the occasion. First, I resolved to answer them myself; and next, to multiply copies, so that others at a distance might have an equal chance of contributing to the success of the plan. Others, I have no doubt, would do the same, and you may deem these an ample set-off against any defalcation likely to arise from the pigmy efforts which such heroes as "Suspicion" can bring into the field. And I confidently say, that we may be sure of the co-operation and assistance of every real friend to the farmer, and the welfare of the poor; and will not fail, in the end, to find that you have attained an object far more useful than these traducers of it will ever accomplish, and, at all events, one far, very far above "Suspicion." *S. T., Barnwood, Gloucester, April* 2. [Many thanks for your assistance: with the cordial goodwill which our object has in so many places elicited, we have no doubt of its attainment]

Evils of Ireland.—Much has been said and written respecting the cause of so great misery in Ireland; they seem to have sprung from political and religious discord of contending parties in bygone times. What a blessing it would have been, if even only a tenth part of the sums expended from time to time in agitation had been applied to teach the people habits of industry. And also, if contending parties would lay aside their disputes, and attend to the poet's remonstrance:

> What signifies for folks to chide,
> At what's been done before them.

They would then be disposed to think more seriously, and see that much of their misery arose from themselves, and might be remedied by their own exertions. The never-ending strife in Ireland has driven and still continues to drive many landlords from their home, and has prevented the growth or rise of a trading or middle class to take the lead in arts and sciences, as in Britain. Whatever else may be said of the state of affairs in Ireland, from those two sources much misery has arisen to all classes. The middlemen have long leases for from 400 to 1000 acres, granted in many instances by the grandfathers of the present proprietors. It was not supposed that they were to farm the whole themselves; they let it divided into small holdings, and may have a profit rent four times the amount of the original one; consequently the middleman fattens between the tenant and landlord, and assumes the name of gentleman. But many leases of these men are nearly expired; and knowing that they will not get them renewed, they take care that their tenants do not get into arrear with them, and give no encouragement to them to improve their land, while these struggle to hold on to the end of the sub-landlord's lease, until they are often left without a cow or pig. Much misery and evil will arise from this grinding system, and many murders recorded in the newspapers are those of middlemen slaughtered by their own tenants, acting under the notion that, when they get rid of them, they will be better off under the head landlord. Supposing that the latter returns home, with a view of improving his property, by introducing a few fresh tenants in room of the former ones, setting a good example in agriculture, and giving employment to the people, he soon finds that he is disliked by the ejected tenantry, and is surrounded by wretchedness and misery, and speedily quits the country, having previously appointed an agent, probably a lawyer, who seldom or never sees the property, but who is well qualified to screw up the tenantry. These soon become poor, and begin to act like the middleman, by letting part of their already too small farms to others at a rack rent, in order to get a little money in hand. By this sub-letting plan the land is cut up into small patches, so that not a respectable farm is seen for miles. It is needless to observe that this cutting up of property tends to lower the grade of the people, who, under better management, might have been comfortable, instead of being oppressed and miserable. In general, however, the Irish tenantry have no reason to complain of their head landlords from being "hand tied" by strict covenants like those on this side of the water. And what is strange, there is no law in Ireland to prevent a tenant letting part of his farm to another—at least if there be it is a dead letter; so that, by this means, many small tenants get upon land unknown to the owner, and are often so poor or so unwilling to pay any rent. These are the great plague of agents, who are often shot when endeavouring to force payment for their master, who may be living in England or France, in needy circumstances. He spurs on his agent, and he fleeces the tenants, that could consume in their own families the whole produce of their wretched farms, the rent all that time leaving the country. So much for the absentees. It may be superfluous to describe the reverse in other districts, where resident landlords manage their property in a better way, spending their incomes at home, and giving employment to the people. There is another class, called gentleman farmers; these obtained their leases in times more troublesome than usual, for Ireland has never seen other than troublesome times, like the middlemen; but instead of letting their land, commenced clearing off the small tenants, and kept all in their own hands, perhaps 1000 acres under pasturage, sending the produce of stock to the English market. A great portion of their land requires draining and other improvements; but they allege that it is more profitable, or what is more true, gives less trouble to let it remain as it is. They observe that the wet ground produces very good Grass during the few summer months; and that they cannot pay for improvements. These of this class are of course a loss to the country, though they are rich and able to indulge in field sports. They plead that they can do what they like with their own; and so does the poor cottier with only half an acre of Potatoes. The too extensive culture of this root is another great evil. I do not allude particularly to the occasional failure of the crops, such as those of late years, which have brought an overwhelming misery that beggars description, but am persuaded that so much land cropped with Potatoes instead of corn, not only shortens labour for the people sorely wanted, but also supplies them with very interior food. Besides, the easy culture of Potato land has a great tendency to

lower the condition of society, by encouraging early marriages. For a young man does not look forward to work for the support of himself and family, his ambition is no higher than to be able to plant half an acre of Potatoes, which is to place him beyond the fear of want for the year. A few days' work enables him to plant and take up the crop; the remainder of the season is usually spent in debasing idleness. Therefore he is a poor workman at home; but when driven from his Potato field into Britain or America, he becomes a good labourer. I refer again to early marriages that are imprudently encouraged, as not only entailing much misery to parents and society by a helpless offspring, but tending also to cut up land in the way described; for a small holder, instead of training his family to trades, encourages them to marry young, and portions out his land among them. They act the same towards their offspring, by which means what was once a respectable family is lost in the common degraded mass. It should be observed, however, that this is owing to the absence of a middle or trading class; for the small holder has little or no opportunity of putting his family to trades, like small farmers in Scotland, who bring up their sons to trades, or educate them so as to enable them to fill respectable situations. Among such are many good land stewards or gardeners, who are correspondents or readers of this journal, and know that the mild winters in Ireland are a drawback to agricultural labour, which is not so much felt in England or Scotland. This may seem strange, but it is nevertheless true, for it costs the British farmer much care and expense for labour, in order to grow artificial crops to feed his stock during winter, while the Irish fields produce Grass nearly all the year. By this it appears that Ireland is better adapted for grazing than growing corn, especially as there is always a ready market in England for live stock. But that sort of farming contracts the demand for labour, as noticed above under the description of gentlemen farmers; and the grand question is, how can labour be increased to repay the capital expended. As there is a wide field for improvement, some advocate introducing British farmers, whose skill and capital are sorely wanted. But this, even with the great encouragement given to emigration, will not remove the dead obstacle in the way, as it will not give employment to the overwhelming population, unless it be accompanied by manufacturing and commercial occupations to give the people work, by which they would be enabled to improve their condition, and consume better food than Potatoes. It cannot be supposed that farming and other rural pursuits can give profitable work to all who are now upon the land. Supposing a farmer takes a lease of 200 acres; before he can occupy them there may be 20 small holders ousted. He cannot of course employ hardly half that number, and the misery that follows turning the poor adrift is harrowing to the feelings of humanity. The British farmer, aware of this, will consider well before he sells his stock, and embarks his all into a land where agitators fill their purse or feed their vanity from the miseries of the people, and excite their feelings against their rulers and employers. *J. Wighton.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's-house, in Hanover-square, on Wednesday last, the 10th of April; present, Mr. Raymond Barker, V.P., in the chair, Mr. Alcock, M.P., Mr. Barugh Almack, Mr. Bastard, Mr. Burke, Col. Challoner, Mr. Clarke, Mr. Dyer, Col Le Couteur, Mr. C. E. Overman, Mr. Parkins, Prof. Sewell, Mr. Reynolds Solly, and Prof. Way.

The following new members were elected:

Anson, Sir John, Bart., Avisford, near Arundel, Sussex
Darby, Joseph, Martock, Somerset
Watts, Henry, Teignmouth, Devon
Pinsent, Thomas, Greenhill, Kingsteignton
Creed, William, Abbotskerswell, Devon
Stevenson, John N., Hayne Manor, Moreton-Hampstead
Wreford, John, Cleaveangter, Lapford, Devon.

The names of nine candidates for election at the next meeting were then read.

Prize Essay.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported to the Council the decision of the Judges appointed to adjudicate on the Essays sent in to compete for the Society's Prize of 30*l.* for the best Report on the Prevention of Abortion in Cows, including a statement of the extent and causes of its prevalence. The sealed motto-paper being opened by the Chairman of the Council, it was found that the winner of the Prize in question was Mr. John Barlow, Veterinary-Surgeon, of Stone House, Wilmslow, near Manchester. Mr. Pusey also reported, that the Judges had "commended" The Essay, on the same subject, bearing the motto "Prevention is better than cure: (A.)" The sealed motto-paper corresponding with this commended essay was ordered by the Council to be transmitted to Mr. Pusey, in order that, in his capacity of Chairman of the Journal Committee, he might open or not, at his discretion, agreeably with the 5th Regulation of competition for Essay Prizes, and communicate, if he thought proper, with the author, with a view of consulting him confidentially as to his willingness to place such essay at the disposal of the Journal Committee for publication.

Irrigation.—Sir Thomas Dyke Acland, Bart., M.P., favoured the Council by transmitting to them the following statement, addressed to him by Mr. John Tyrrell, of Exeter, on the probable cause of the fertilising power of the water employed in irrigating meadows.

"I see from the proceedings of the Royal Agricultural Society, that you take a considerable interest in watered meadows. I fancy I have lately discovered that the benefit derived from the water on such land is principally the result of the animals the water calls into existence. The microscope shows us countless millions of these animals, where irrigation is going forward; while they are found 'few and far between' upon fields that have not been watered. They are principally of the same family that are frequently found fossil in some of our oldest deposits. It strikes me, they may assist vegetation during their lives, by supplying carbon to the roots of plants, or by disintegrating and converting into manure the decaying vegetable matter around them. When dead they must furnish not only animal but mineral manure, for the shells with which most of them are covered consist of silica."

Jersey Cattle.—Colonel Le Couteur, Viscount of the Island of Jersey, presented to the Council lithographic impressions from two beautiful drawings, made by himself, of a bull and cow of the Jersey breed, on which were marked the "scale of points," approved by the Royal Agricultural Society of Jersey at their general annual meeting in January last, as constituting perfection in their peculiar and well-known breed of dairy cattle, and as furnishing to their judges a simple and definite process for arriving at satisfactory conclusions in making their awards. Col. Le Couteur entered into a detailed and very interesting statement of the character of animals in which any one or more points specified in this scale were more than usually developed. The drawings then laid before the Council were not portraits of any particular bull or cow of the Jersey breed, but represented an ideal assemblage of individual excellencies occurring in different animals, and selected from the finest cattle on the island, collected together at Col. Le Couteur's farm for the express purpose in view, and carefully submitted to the inspection and comparison of the gentlemen who formed the special committee appointed by the Jersey Society to revise the "points" of their stock. Col. Le Couteur, in detailing the points thus agreed to by the committee, called the particular attention of the Council to some of those points found to be most intimately connected with the natural excellence of the animals and the characteristic peculiarities of the Jersey breed, of which the island, in Col. Le Couteur's opinion, at that time contained some of as perfect specimens as could well be conceived. He remarked that the cows which had the inside of the ear tinged with a deep yellow colour, were invariably found to yield butter of a rich orange colour, while those with ears of a lighter tint furnished butter of a correspondingly inferior quality, and of a paler hue. In the finest stock, too, the eye of the cow was soft and placid, while that of the bull was lively and full of fire. The "action" of Jersey cattle also indicated, not only their muscular power and their mode of employing it, but that general conformation and adaptation of parts which constituted excellence: a finely-bred Jersey animal, Col. Le Couteur remarked, ought to walk off the ground like a race-horse. By means of this determination of a standard scale of points, the labour and responsibility of the judges was much reduced, while their decisions almost invariably gave satisfaction; as, in the case of any difference of opinion, a third party being called in, the award is at once decided. During the 10 years that he had acted as Secretary to the Royal Jersey Agricultural Society, he had never known the occurrence of an absolute case of dissatisfaction. In reply to inquiries made by the Chairman and Colonel Challoner, he proceeded to state, that no animal received approval excepting through the Society, the members being allowed a free exhibition, while strangers are required to pay an entrance fee; the number of points assigned by the judges being duly stamped on the horn of each animal. Colonel Le Couteur, in reply to further inquiries, admitted that this guarantee of merit might by unprincipled dealers be imitated for the purpose of deception. At the present time, many animals were easily passed as of the true Jersey breed, especially those of black, or black and white colour, from Normandy, and others from Brittany, which were very inferior, as dairy stock, to the genuine animals of that breed.—The Chairman wished to know how the term "Alderney" had been generally applied in England to the Channel Islands' cattle, and whether the animals of that island possessed advantages over those of Jersey or Guernsey.—Colonel Le Couteur said that, on the contrary, there was at the present time scarcely an animal in Alderney that he would think worth purchasing. He explained that that island had belonged to his great-grandfather, who introduced into it a great number of the Jersey cattle, which, however, from the inferiority of the pasture, soon deteriorated from the original stock. Colonel Le Couteur, Mr. Parkins, and Mr. French Burke, then cited particular instances of the great amount of butter yielded by dairy cows, during the flush of Grass in May and June, or throughout the year, if fed in a particular way, and tended with great care; namely, 16lbs. a week in those months, or 1lb. a day in other cases during the year.—Colonel Challoner then stated the case of a finely-bred handsome Jersey bull of his own, which, though perfectly healthy and fat, had his skin constantly affected with a yellow powder or scurf of a deep orange colour, especially within his ears and on his tail, a result he could only attribute to an abuse made of him by parties to whom he had been good-naturally lent.—Colonel Le Couteur then expressed the great pleasure it would at all times give himself, as one of the Governors of the Royal Agricultural Society of England, or his successor in the office of Secretary to the Royal Agricultural Society of Jersey, to receive applications from any of its members who required advice and aid in obtaining the best dairy animals which that island could produce. He had had last year the satisfaction of freighting a vessel with 33 head of such stock, to a gentleman residing in Scotland, which arrived in perfect safety, and maintained the high character of the Jersey breed.—The Chairman referred to a challenge given by Mr. Villebois, one of the Governors of the Society, to the county of Berks, in which he resided in favour of two of his dairy cows of the Channel Islands' breed, which had produced him both milk and butter of almost unexampled quantity and quality.—Mr. Alcock, M.P., remarked that it would be highly desirable, if, in the case of other breeds of cattle, a similar scale of points could be established, in order that the doubt and difficulty of the judges, and the frequent dissatisfaction of competitors, might be removed by the adoption of such a defined standard of adjudication as would have the effect of limiting and defining the conditions of merit in the competing animals.—Colonel Le Couteur stated, that when some years ago he had shown to the late Earl Spencer the scale of points for the Jersey cattle, his Lordship expressed to him the desire he felt that such a step should be taken in reference to other breeds.—Colonel Challoner said that he could fully corroborate that statement, for he had the pleasure of being present with Lord Spencer and Colonel Le Couteur at the time it was made.—Mr. Burke remarked that he was also fully aware of Lord Spencer's wishes on that point.—The Chairman felt how highly desirable the adoption of so definite a system would prove, but at the same time he feared that our judges would have great difficulty in defining the required points, and unanimously agreeing to them.—On the motion of Mr. Parkins, the best thanks of the Council were expressed to Colonel Le Couteur for this kind offer on his part, and for the interesting documents and statements with which he had favoured them.

Miscellaneous Communications.—M. von Bechtold, Ministerial Councillor, and President of the Central Board of the Agricultural Societies of Hessia, transmitted to the Council a communication on the part of Count Salms-Laubach, President of the Agricultural Society of Upper Hessia, in the grand Duchy of Hesse, on the subject of the different breeds of Sheep.—Mr. Henry Clayton addressed a further communication to the Council, on the conditions under which, in his opinion, the trial of Draining Pipe and Tile Machines ought to be made, in order to obtain results which subsequent trial and the ordinary working of the machines would be found to confirm.—Mr. Beale Browne transmitted an average sample of the Flax Seed grown by him in Gloucestershire.

The Council then adjourned to Wednesday fortnight, the 24th inst. (Prof. Way's Lecture being fixed for that day week, the 17th inst.)

Highland and Agricultural, *Feb.* 13: *Feeding of Farm Horses.*—Mr. Gibson, of Woolmet, said:

The system of feeding I adopt is as follows: From the middle of October till the end of May my horses get one feed of steamed food, and two feeds of Oats daily, with the best Oat or Wheat-straw for fodder. I never give Bean-straw, having often seen the bad effects of it—partly owing, I think, to its long exposure to the weather, and from the quantity of sand which adheres to it; I use it generally for litter. The steamed food used is well washed Swedish Turnips and Potatoes, in equal proportions, mixed with sifted Wheat-chaff. In those years when we had a total loss of Potatoes, Swedish Turnips alone were used, but not with the same good effects as when mixed with Potatoes. This year, having plenty of diseased Potatoes in a firm state, I give a larger proportion of Potatoes than Turnips, and never upon any occasion gave Oat-husks, commonly called meal seeds, having often seen their injurious effects. At 5 o'clock in the morning each horse gets 6 lbs. of bruised Oats; at noon the same quantity of Oats; and at half-past 7 P.M. 47 lbs. of steamed food. I find that it takes 62 lbs. of unsteamed Potatoes and Turnips to produce 47 lbs. steamed; to each feed of steamed food 4 oz. of common salt is added, and mixed up with one-fourth part of a bushel of Wheat-chaff, weighing about 1½ lb. A greater quantity of Wheat-chaff than this has generally too laxative an effect. Each horse eats from 14 lbs. to 18 lbs. of fodder during the 24 hours, besides what is required for litter. During the spring months I sometimes give a mixture of bruised Beans and Oats, instead of Oats alone. From June to the middle of October, those horses that are required for the working of the green crop, driving manure, and harvest work, are fed with cut Grass and Tares in the house, and about 7 lbs. of Oats each day, given at twice, increasing or decreasing this quantity according to the work they have to do. I turn out to pasture those horses only that are not required until the busy season. I disapprove of horses that are regularly worked being turned out to Grass, and exposed to all the changes of our variable climate. I believe it is the origin of many diseases. The expense of this mode of feeding, at present prices, in the district, for each horse per annum, is as follows:

	£	s.	d.
12 lbs. of Oats per day for 30 weeks, is 7½ qrs. of 42 lbs. per bush.			
7 lbs. of do. for 22 weeks, is 3⅝ ditto ditto.			
10⅝ qrs. at 17*s.* ...	9	0	7
145 stones straw consumed, at 4*d.* per stone of 22 lbs.	2	8	4
Each horse consumes 5 tons 16 cwt. of Turnips and Potatoes in 30 weeks.			
58 cwt. of Potatoes, at 1*s.* 6*d.*	4	7	0
58 cwt. of Turnips, at 9*d.*	2	3	6
53 lbs. salt, 1*s.* 8*d.*, 52 bushels Wheat-chaff, 4*s.* 4*d.* ...	0	6	0
22 weeks on cut Grass and Tares, at 9*d.* per day ...	5	15	6
	£24	0	11

For the 30 weeks the keep of each horse per day is 7*d.* for Oats, 7½*d.* for steamed food, and 2½*d.* for fodder; for the 22 weeks the keep is—Grass 9*d.*, Oats 4*d.*, or 1*s.* 1*d.* per day. The expense of preparing the steamed food, including coals, is ½*d.* per day for each horse. Two hundred and sixty stones of straw will be required for litter for each horse during the year; for this no charge is made, as it is left in manure. By this mode of feeding, the horses are in fine sleek condition, and able for their work. I have acted upon this system for the last 15 years, have always had from 16 to 20 horses, and during that period I have only lost 7 horses, 3 of them being from accidental causes; and I attribute this, in a great measure, to the mode of feeding, and, in particular to the steamed food.—Mr. Binnie, Seaton Mains, said: For the most part the soil of my farm is of a light nature, and the system I have generally followed in feeding my work horses has been attended with success. I consider that economy in feeding the horse embraces the health, condition and stamina of the animal, and I have found those

ends well served by ad , as nearly as possible, the following mode of manage from the 1st October to 20th May, my horses get fed thri a day; the morning and midday feeds consist of 7 lbs. of Oats and bruised Beans each feed (one part of the latter to two of the former), the present cost of both diets will be something like 9*d.*; the evening's meal is composed of 35 lbs. of Turnips and 6 lbs. of Barley well boiled together, which (with the expense of coals, salt, and woman's wage in cooking), I put at 6 . I use only Wheat or Oat-straw (uncut) as fodder, and I w ke the cost at 3*d.* a day. From 20th May (when, by to sing, I have generally a cutting of Grass) until 1st July, I allow two feeds of Oats and Beans, as I have before mentioned, and as much cut Grass as satisfies the horse in stable during day, and turn him to the pastures for the night. From 1st July to 1st October, I find, on an average, that my horses consume, as nearly as I can calculate, a feed of Oats each per day; and taking cutting and pasture Grass at 7*l.* per imperial acre, my statement resolves into a cost, as nearly as possible, of 28*l.* 10*s.* per horse per annum. In my calculations I have assumed the value of 42 lbs. Oats to be 19*s.* per qr., 65 lbs. Beans to be 28*s.*, and Barley, weighing 53 lbs. per bushel, to be worth 20*s.*, and Turnips 15*s.* per ton. I can strongly recommend the black Tartarian Oat for the use of the horse, as, from its peculiar formation, the horse is necessitated to masticate it thoroughly, and it has also the advantages of giving a very large acreable produce, and having a high standing in the Oat class for its fineness of husk and its mealing properties. I would also advise the growth of the white Belgian Carrot, as a most nutritious, safe, and economical article of food for the horse. It is easily raised, and can be grown to yield 18 tons per imperial acre on moderately free land. On account of the Carrot keeping its moisture much longer than the Turnip, I have found it most beneficial in its raw state, for spring feeding. I beg to close my remarks by saying that home experience, as also that acquired while engaged as inspector to a cattle insurance company, have taught me that too much care cannot be given to the properly ventilating and cleaning of our stables, as I am convinced that more horses are lost by inattention to these points than by any mode of feeding I have ever seen practised in the Lothians.—Mr. Steedman, Boghall, said: Gentlemen, being called upon to take part in the important discussion on the "Best and Most Economical Mode of Feeding Farm Horses," I can give you no mode better and more economical (at least as far as I know) than the one I myself adopt. In the first place, my horses get in the morning 5 lbs. of Oats, along with two or three small Swede Turnips (raw), and the same at 12 o'clock or dinner time; in the morning the boiler is filled with 56 lbs. of Turnips and ½ lb. of Linseed for each horse; the Linseed being difficult to boil, is put into a small bag, and then placed in the middle of the boiler amongst the Turnips; when boiled without a bag it is apt to boil over, and liable to sit on and burn, and in consequence the most nourishing part of it is lost. After the Turnips and Linseed are boiled, they are thrown into a large trough or cooler, and a little Wheat-chaff, along with a handful of salt for each horse, well mixed together, and cloths, or a lid for the purpose, put over the cooler, and allowed to cool slowly. The weight of the Turnips being 56 lbs. when put into the boiler, you will find reduced to about 40 lbs. About the half of this is given at dusk, or whenever the horses return from work, and the remainder at 8 o'clock, when the men go to clean and do them up for the night. The expense of the Oats and Turnips twice a day (at the present prices) is about 8*d.*, and the boiled food 5*d.*, making in all 1*s.* 1*d.* a day; giving them Oat-straw, upon which I set no value, allowing it to go in lieu of manure from the horses. Under this system, which I have adopted for the last six years, I have found my horses healthy, in good working condition, and always ready for their work, working them from daylight to dark in the winter months (except when they are feeding in the middle of the day); and, when prevented from farm operations by the weather, they go to Edinburgh for dung, and seldom or, I may say, never return, with less than 30 cwt. gross. Previous to boiling, I used to steam Turnips and Potatoes, but lost upwards of 40 horses, and since I commenced to boil, I have been at a great expense with boilers cracking; but for some time past I have used a malleable iron boiler, made by Mr. Slight, engineer, Leith Walk, which I find to answer the purpose admirably. In the spring of the year, instead of giving the horses Oat-straw, they get hay, which increases the expense to about 3*d.* each; but their work being harder, and hours longer, I consider it necessary. In summer they get Grass, costing about 6*d.* each, which I believe to be far more profitable than driving it to Edinburgh and getting a shilling, in consequence of making more manure, and saving labour. I may mention that the late Mr. Scoon, tenant at Pentland Mains (an adjoining farm to mine), used to feed his horses with two feeds of Oats a day, and at night they got raw Potatoes, just as they were lifted from the pit or Potato house (only riddled), and during his 19 years' lease, never lost a horse. The present tenant, Mr. Brown, has nearly run another 19 years, and to my knowledge has lost 15 or 16 horses, with feeding them differently. The only way I can account for this is, that Mr. Brown feeds higher and works harder. The breed of horses Mr. Scoon had was a breed rare to be seen now-a-days; they were mostly all blacks, with short legs and backs, deep-ribbed, broad-chested, with a good flat bone, and rare action—very unlike the present breed, long-legged and backed, narrow chested, and with as much hair and clay on their legs, carrying along the road with them, as I am sure would weigh more than 4 lbs., and more like camels than horses; at least our forefathers, had they seen them, would have called them so. The great point in keeping horses in good condition (and consequently keeping them cheap), is to feed regularly, and have them well groomed; also to attend to the ventilation of a stable, which I am sorry to say is rather overlooked in many cases. In addition to the present ventilators, which you frequently see placed in the roof of a stable, there ought to be a common drain tile, 3 or 4 inches diameter, built in the wall, from 3 to 4 feet above the horses' heads when standing, and 4 feet apart, the same on the opposite side, or behind them; then you will always find your stables sweet and wholesome, the horses healthy, and with good appetites. There is apparently a great loss attending horses' feeding, in consequence of the mangers not being properly constructed; I would therefore strongly recommend all those who are about to build a stable, to have cast metal mangers, placed on one side, levelled in the bottom, and fluted at the top, that is to say, with a projection over the inside about 3 inches. I have no doubt but that most farmers must have noticed horses, when feeding, throwing the meat out of their mangers with their noses, and frequently throwing a considerable quantity over, which would not occur if the projection I have spoken of was attached to the manger, also having a rack on the other side, filled with hay or straw, as horses frequently eat when lying. Grain, at the present prices, would be cheaper to boil than Turnips; but the change in the system of feeding might possibly cost a horse or two, and neither I, nor I believe any other tenant, is at present in a position to try experiments which might perhaps add very materially to the loss of money which we are now undergoing, and which had little need to be increased; therefore I am contented to let well alone, as far as feeding horses is concerned.—Mr. Finnie, Swanston, said: All that I intend by my remarks, on the present occasion, is to lay before the meeting those principles and rules which, in my humble opinion, should form the basis of what may be termed an economical system or mode of feeding farm horses. The primary and all important of these I would state to be, an artificial preparation of the food, which may be embraced under the following heads: 1st, the cutting or chopping of the fodder; 2d, the bruising of the grains; 3d, the boiling or steaming of the roots. Various are the articles which may be used as food for the horse: take the grains, we have Oats, Barley, bran; of the leguminous plants, Beans and Peas; of the roots, the Potato, Turnip, Carrot, Parsnip; and what is used as green food, Clover, Tares, &c., and even Whins; and then the Grasses in their dried state, the straw of the Cereal grains, and even linseed cake, linseed, &c.; but upon the present occasion, and for practical purposes, we ought, I think, to confine ourselves to the produce of the farm. Now, in support of my first principle, viz., the artificial preparation of food, I would say by its adoption we will be found consulting the laws of nature, and by being so, can never fail in being right. My attention was early directed to this fact by reading an article (on cooked food for horses) in the "Quarterly Journal of Agriculture," in 1832, from the pen of our able and celebrated professor of veterinary surgery, Mr. Dick, and which it would be well worth while to republish. Mr. Dick very properly calls in question the prevailing indifference on the part of owners of horses to the state in which that animal receives his food, describes the peculiarity of the process which his food undergoes before it passes on to be digested, and from his knowledge of the anatomy of the horse, argues that an artificial preparation of his food cannot fail to be economical. Mr. Dick concludes thus: "That before the food can properly yield nourishment to the animal, it is necessary that it be minutely broken down and cooked, either naturally or artificially, before digestion can take place, and I further conclude that the more completely we do this, the more readily and completely will the nutritious portions of the food be taken into the system, and thus by avoiding almost the possibility of waste, the animal will be kept in the same condition at a less cost to the owner." I think it unnecessary to add more upon that point, but shall proceed to the practical working out of this theory, and will commence with the fodder, suppose that to be straw, but which I would restrict to that of either Beans, Oats, or Wheat, Barley-straw being universally admitted to be bad for horses. Bean-straw I propose not to refer to again, although I believe it to be the most valuable, and even within the scope of my remarks; still not being a grower of Beans, I wish to advance nothing but what is founded on my own experience. Now the article of straw contains a high relative value in certain localities, and when such is the case there is less waste by cutting or chopping it; but even take a district where the principal object is to convert it into manure, I would even argue in favour of artificial preparation, having found from experience—1st, That the horse will thus be induced to take a much larger proportion of it within the 24 hours; 2d, That you will afford him some hours during that time of additional rest, to recruit his exhausted system, as, comparatively speaking, he requires almost no time to fill himself; and 3rd, and not the least important consideration, that the more fodder he eats the better will be his condition, for I maintain that any stranger going through a stud of farm horses will have no difficulty in pointing out to the farmer his best consumers of fodder. But, before passing from the cutting of fodder, there is still another recommendation which I think it has. We all know that as the winter advances, and the spring commences, very little of the natural sap remains in the straw, consequently it becomes less palatable, and invariably after wetness in harvest, which we rarely escape from, it is never good, and being one of those that think that hay should to a great extent, if not altogether, supersede the use of straw, where no Beans are grown upon the farm, I am firmly convinced that give a farm horse as much of the grains as he can consume, if his fodder is indifferent, that animal can never be kept in a thriving state; this may be accomplished by the use of the cutting-machine, but not without it, as I know the profligate waste whenever ploughmen have leave granted to frequent the hay-stack. By cutting, however, the farmer can well afford either to give hay alone, or in a certain proportion mixed with the straw, for, in either case, he will find that less corn will suffice. Then as to the bruising of the grains: and need I do more than direct attention to the solid excrement of the horse? and as appearance will require no further demonstration to prove that grain given entire produces the loss of a very large proportion of nutrition, some allege a tenth part, I would say much more, but at all events a good deal, will be seen voided without having undergone any change. It is, I think, unecessary to occupy the time of this meeting with any further remarks on this point, as there cannot be a better illustration of there being an unnecessary expenditure of food, if bruising of the grain is neglected. I shall now refer to the steaming and boiling of the roots, viz., the Potatoes and Turnips, and perhaps I may be found differing with many of my practical friends; but I will state what my conviction is, and which has been founded on some little experience, and I would say, first, that by boiling or steaming the Potato and Turnip there is less risk of endangering the health of the horse; and, secondly, that you maintain him in better condition. I would instance the practice of horse dealers, whose object is to obtain that condition which is essential to enable them to realise a profit between purchase and sale; and I believe they will admit that either boiling the roots or grains, or steaming the roots, is indispensable to their business; but I would say further, that it is surely more in keeping with the laws of nature, when you subject the system of the horse to what may be termed an artificial treatment, to study the food most congenial for him under such circumstances; and I think it can hardly be disputed, that after exposure to cold, wind, and wet, that a comfortable supper of moderately warm cooked Turnips and Potatoes, well seasoned with salt, is a more inviting and salubrious mess than if they were given in their crude and unprepared state. Some farmers give two feeds of boiled or steamed roots per day, to that I have no objection; all that I would wish to maintain is, that the horse, during the winter months, should have at least one mess cooked for him in the day; and if it is not found profitable to give either Potatoes or Turnips, let a boiled feed of Beans or Peas be substituted, and that at the close of his day's work. Before disposing of my straw-cutter and bruised grain, I may further remark that Mr. Dick is not my solitary authority. I may point to the practice of our enterprising townsmen, Mr. Croal, to Mr. Isaac Scott, or to the Messrs. Laings; I believe the two former have been found cutting hay and straw, and bruising their grain for at least 20 years; I know the former, 17 years back, had no hesitation in stating that his annual saving in his establishment by doing so was not less than 150*l.* Go to London, and there I found establishments with from 100 to 300 work-horses doing the same. I believe it is very general on the Continent; now, such authority as that I hold to be worthy our imitation and consideration, inasmuch as in those establishments, the food is all purchased, and must be obtained, at whatever cost, and the very success of their business depends upon the condition in which they can turn out their horses, and often to the hardest work. I now come to the treatment of horses during the Grass season; and here I may be found at variance with other practical men. My opinion however, is, that the objections to the pasturing horses are unanswerable. In the first place, I would say it is a most expensive manner of feeding them, inasmuch as less ground would suffice if the Grass was cut green, and given either in the stables or yards; secondly, that there is great waste of manure; and lastly, but not least, the poor animal is turned adrift to roam about and search for his food, with an exhausted system, and is thus deprived of the rest necessary to enable him to perform the requisite labour you extract; and after great exertions and copious perspiration, with a relaxed system, having every pore in his body open, he is left to seek his bed on the cold and often wet ground, exposed to the elements, and which treatment cannot fail to predispose him to disease, instead of being well groomed, just as important for him as the much cared-for racer, well littered, and allowed to use what, otherwise, would be an empty stable. There is one thing, however, I should wish to notice in connection with soiling horses, and that is, that, in order to avoid waste, the Grass, when cut, should be put into bunches, and let the size and number of those be apportioned, from time to time, to the consumption; as I need not remark, that in proportion to the mixture of Clover, its wet or dry state, or the succulency of the Rye-grass or Tares, will be the ratio for the daily allowance of each horse; and when these are brought home, every ploughman receives the number allotted for him; thus from the field to the rack there is no loss in transit. When, on the other hand, it is brought home in a loose state, each ploughman with his fork selects what suits his fancy best, scattering and treading no small portion of the heap, filling the rack to overflowing, and what is not consumed at the time is left to ferment until his return to the stable, when it is cast to the dunghill. I have found from actual experience that the difference in saving between bunches and bringing home Grass in a loose state amounted to 1*s.* per head per horse per week, and that upon an establishment of 20 horses was no small consideration. Having, I fear, exhausted the patience of this meeting by extending my remarks on what I thought the most important points to be attended to in farm-horse management, I shall be very brief in what I have to say about the quantity each horse may be expected to require per day. This, as I said before, must be left entirely to the judgment of the farmer, as well as the grain and other farm produce which ought to predominate in the feeding of his horses—I would say invariably let it be what is of least marketable value. If during the Grass season the work is light, the grain may be very much restricted, or even dispensed with altogether; and in the winter season, even at regular work, from 10 to 12 lbs. per day, in addition to their cooked food for supper, will be found sufficient; when hay is given, from 2 to 3 lbs. less of grain will suffice. I find my best fodder eaters consume at the rate of 17 lbs. per 24 hours of cut Oat-straw, and the saving between giving hay entire and cut will be in favour of the latter in the proportion of a third; and the only point in which I differ from my friend Mr. Dick is in preferring my Oats bruised rather than ground, as I think my horses masticate them well, and certainly appear to like them better. Another point I ought not to admit, and that is changing from heavy to light grain, or *vice versa*; the feed should be in proportion to the weight. If this is neglected, overfeeding at one time and underfeeding at another must take place; and it being the usual practice of all farmers to consume all the light Oats first, and when they run out to fall back upon the good, and that a difference of 6 to 8 lbs. per bushel is often found to exist, the necessity for this test I think is plainly made out. I shall only trouble you with one other observation, and that likewise bears upon the economy of farm stable management. It is the undesirableness of trusting the feeding of the horses upon a farm to any one whose employment is that of a regular ploughman; for, without calling in question the honesty of one in such a situation, I would say his horses seldom appear in worse condition than that of the others. This occasions heart-burnings amongst the other ploughmen; that is not all, there is often favouritism. I likewise object to the system of each man being the custodier of his horses' corn; I do not think economy can exist in either case. My own practice is to entrust one to serve out the grain given to the horses, totally unconnected with the ploughmen, and the advantage of doing so rests in having the food of the horses distributed in proportion as they require it. If at easy work he restricts it; that a regular ploughman will never do. And as in every establishment some horses are more easily kept than others in good condition, with this arrangement, the food is given in either larger or smaller quantities, as the constitution of the horse or the nature of the work to be performed requires: and in this way a more thorough control can be exercised over a department in farm management which is certainly not the least expensive to maintain. Mr. Finnie concluded his speech by remarking that, with regard to the annual expenditure required for the horse, his experience coincided with the details given by Mr. Gibson. He (Mr. F.) considered, however, that Swedish Turnips were of too laxative a nature for the horse, and he had made use of boiled Peas. Before the Potatoes became so bad, he had been in the habit of using five parts of Turnips to one of Potatoes. But, in the main, he was disposed to corroborate the statements of Mr. Gibson.—Mr. Thomson, of Hangingside, said: The course I have adopted for many years has been as follows, viz.: during the summer months, two feeds of Oats per day, of 6 lbs. each, with Grass; and during the winter and spring months, the same quantity of Oats, with a boiled feed at night, consisting of Swedish Turnips, mixed with Beans, Barley, and clean chaff, weighing 40 lbs., to each horse, using salt and 1½ oz. nitre to each animal once a week; by this mode of treating my farm horses, disease has hardly been known in my stables. Care should be taken that this quantity of the prepared food should not be exceeded, as it may be considered the maximum to be safely given. Important as is the amount of nutritious food allotted to a horse, not less important is the kind and quality of the fodder that is to be the accompaniment; if possible, the fodder of any year's growth should not be used in the same year: that is to say, the fodder and crop of year 1848 should form the supply over the whole of 1849. At this period of the season, the natural moisture which produces fermentation in the stomach of the horse is exhausted in the crop of 1849, and the animal is saved from those acute attacks arising from disordered bowels, which the susceptibility of his system renders him liable to. Barley-straw should never be given to a horse; it is so productive of flatulence that he hardly ever eats it unscathed. As to the question of economy—the food which supplies the largest amount of fat and muscle, torn from a horse by hard work, is the cheapest. Regularity in the treatment of the horse is of the utmost consequence, whether as regards food, drink, work, or mode of keeping and dressing. He is the most easily affected of all the domestic animals by any sudden change, and is more subject to inflammation than any other. He should have but one day in the seven for rest, and as seldom as possible be over wrought; an extra hour or two will tell upon him for several days. As different horses have different constitutions, they require to be treated accordingly—the appearance of the coat speaks at once to the eye, but the state of the bowels is the surest index of the health of the animal. Bruised corn is preferable to whole, both as it obliges the horse to masticate, and is more easily digested.—Mr. Black, of Dalkeith, said: I am afraid that my system of feeding farm horses will not be approved of by farmers generally, as they may consider it expensive. All the farm horses under my charge are allowed 16 lbs. of hay, 12 lbs. of bruised corn, and 28 lbs. of boiled Turnips per day, during winter and spring, which at present prices in my locality will amount to 1*s.* 6*d.* per day. I consider boiled Turnips, when given judiciously to cart horses, a most palatable, nutritious, and gratifying food, particularly to young horses; and not less so to those intended for coach or saddle than for farm work—they grow much faster and look much healthier, with nice sleek coats. I have generally from 20 to 30 horses young and old, fed on boiled Turnips; and to convince you that they are wholesome, I have only had one death from disease during these last four years, and that death was occasioned by the bursting of a blood-vessel. I consider it of the greatest importance to keep farm horses in good condition, or rather fat, as I consider good condition in a farm horse a good flesh coat. Weight is always advantageous in slow work, indeed weight is power in the heavy draught.—Mr. Scott, Craiglockhart, said he very much agreed in the statement made by the gentlemen who had previously spoken. But he did not altogether concur with Mr. Gibson in the opinion that Bean-straw should not be given to horses; he (Mr. S.) had long been in the habit of giving that kind of food, and he was aware that others had; and his opinion was, that its value was not much inferior to hay. He had also found much advantage when horses were working hard, especially in the spring months, to adopt a judicious plan of a division of food. The interval, he considered, was too long for a horse to want food, from an early hour in the morning to 12 o'clock

and a small feed of Oats at about 8 o'clock he found was valuable to the animal.—Professor Dick remarked that he was not prepared to enter at length upon the subject now before the meeting, as he was not present at the commencement of the discussion; but from what he had heard he thought he could gather pretty accurately the opinions of the farmers as to the feeding of their farm horses. There was one point, however, which had been but incidentally touched upon, and to which he would suggest that more attention should be paid. He alluded to the giving of food to horses at shorter intervals. He approved of cooking food, but the danger lay in giving it in too large quantities at a time. In the evening, when the animal was somewhat exhausted, and the cooked food was easily swallowed, the stomach became overloaded, and every farmer well knew the consequence. Food ought to be given in the morning, before going out, and again, as has been recommended, at 8 o'clock; indeed, a greater division of food would at all times be found advantageous. He knew one gentleman who had lost a number of horses through inattention to this, and though he (the Professor) was generally sent for, he always found the animal dead before he got to the place. (Laughter.) He suggested an alteration in the way of feeding the horses, especially that the evening meal should be divided into two feeds, instead of giving it all at once. When the animal came in from its work one portion could be given, and the second some time after. He (Professor Dick) did not think that the gentleman referred to lost a single horse afterwards, except on one occasion, when a servant gave one of the animals a too large feed. He (the Professor) would also mention the advantage of allowing a horse to rest twice during the day at least. It was most injurious to a horse, to allow it to work on for a number of hours consecutively without food. The stomach of the animal was small, consequently could not contain food sufficient to enable it to work a great portion of a day without a renewal of food and rest. Sometimes the stomach was literally stuffed full, and its power of contracting and acting on the contents was thus destroyed. In consequence of the peculiar structure of the animal, the stomach soon became empty, and when distended either with food or the want of it, it was much injured. A combination of hay and Oats chiefly would be found the best kind of food, though some thought it expensive; and to cut the hay and bruise the Oats was much to be recommended. If the corn be bruised or ground, it could be taken with safety; for it would be deprived of its vitality, and thus digestion be quickened. Mr. Thomson recommended hay and Oats, with a little bran mash, as the best feeding, and in this he is right. He added to this the propriety of giving a little alterative medicine; he (the Professor) was one who was more in the habit of giving medicine than in taking it (laughter), and he would advise Mr. Thomson to put a handful of salt among his horses' food, instead of any alterative medicine. No doubt an alterative medicine would make an alteration (laughter), but what sort of an alteration? It would be found that any interference with the profession of the regular practitioner was by no means a good thing for the farmer. (Laughter.) When medicine was really wanted let the farmer send for the doctor in time; let him give small quantities of salt amongst the food; but let him have little to do with alterative medicines. All kinds of medicine were alterative; but he would have his farmer friends to have more faith in a handful of salt and good food judiciously given than in quack alterative medicines, which were so plentifully advertised. (Laughter and applause.) He had that day had some cake sent him as being good food for horses, and suited to their strength; but he had no specimen of it with him. He might observe that a certain quantity of innutritious food was necessary to go along with the other, because if the food be too rich or nutritious, the animal would assuredly suffer. (Applause.)—The Chairman said that the meeting was certainly much obliged to those gentlemen who had given their opinions on the subject of feeding farm horses, and now Mr. Usher would show the working of his steam plough.—Mr. Usher then exhibited the model of his steam plough, which created a very great interest amongst the numerous farmers and others present.—On the motion of Sir James Russell, K.C.B., a cordial vote of thanks was tendered to the chairman, for his able discharge of the duties of the chair.

Calendar of Operations.

APRIL.

Bedfordshire Farm, *April* 8.—The weather for the past month, and up to the present time, has been everything that could be desired for sowing spring seeds, and preparing the green crop fallows. Barley sowing has been finished some time, under the very favourable circumstances of a well pulverised and deeply loosened soil. Carrots have also been sown on a most congenial bed; and, in fact, all seeds, and every operation of the farm, has gone on satisfactorily, and with good promise for the future crops. The winter Wheats have a very healthy appearance. Our crop has been all hoed, harrowed, and some upon light land has been rolled with Crosskill's crusher. The Wheat planted with Dr. Newington's dibble at the rate of a bushel per acre, and now quite thick upon the ground, was sown early in October; the late sown is however too thin to present appearances, and shows the necessity and advantage of early sowing. The store cattle in yards have a run daily in the fields, and appear to thrive upon a little Grass, and dry food at night. Every one has not the opportunity of turning out their cattle through the day, and taking them into the yards at night; but where such can be done, it is desirable to do so, as cattle frequently lose condition at this time when wholly confined to yards with dry food; and when turned out all at once to young Grass, they are apt to scour, and go back instead of forward for some weeks. The horses here are now being employed in harrowing Grass land, carting stones off Grass and seeds, and rolling the same. Dung carting will be the next operation, with the carriage of liquid manure. We have four tanks, and apply the contents to both arable and Grass land, as it happens. The liquid manure appears to do as much good on arable as pasture or seeds. In dry weather we think it much preferable to apply it to arable land, as it imbibes and retains it better than the hardened surface of Grass. The fallows intended for Mangold Wurzel will soon receive another ploughing, and other preparation for the seed. We usually commence sowing at the beginning of May. The Orange Globe yields the largest weight per acre. After the Mangold Wurzels are sown, a few acres of Tankard Turnips follow for early consumption. Swedes are afterwards sown at intervals till nearly the end of June, when if any land after Tares remains unsown, a quicker growing Turnip takes the place of Swedes. The sheep have still a few Turnips to consume. The strongest ewes and lambs are put upon Italian Rye-grass. After the first bite of Rye-grass, Rye will be ready, with ordinary weather, then winter Tares follow, and, by the various sowings of winter and spring, ought to supply the sheep till the stubbles and early Turnips are ready. The fatting cattle have a daily allowance, about a bushel, of Mangold Wurzels now, with corn and chaff. The fatting pigs live upon Barley and Pea-meal. Store pigs have steamed Mangolds and Carrots, with a few Peas. There are more roots, more Turnips, Carrots, and Mangold Wurzel grown in our neighbourhood now than formerly. Vast breadths of Potatoes are again being planted. Corn-growing at present prices is at a discount. Tradesmen are very tenacious in holding up the price of day-work to former rates. Your proposition in last Saturday's *Gazette* is deserving of much attention. Some tradesmen are obstinate enough to remain idle rather than submit to a reduction of price with a chance of constant employment. *R. V.*

Lammermuir Sheep Farm, *April* 1.—The past month has, with the exception of the last week, been peculiarly favourable for hill sheep stock; the weather has been dry throughout, and, with the above exception, calm and mild. This has not only caused the moss to spring vigorously, but enabled the sheep quietly to range the higher grounds in search of it. The abundance of this valuable plant, and a slight spring on the pastures generally, has wrought a material change in their appearance, being fresher and in better spirit than they frequently are during the stormy month of March. We trust they will continue to improve, though the severe frost we have had for the last month augurs the reverse—the thermometer at 21° being very unfavourable to vegetation. The Cheviot shearling ewes, and some of the leanest of the older ages, have been on Turnips for some weeks, and will continue to receive a few until the lambing begins, when they will be returned to their respective pastures. We should have liked all the Cheviot ewes to have had a few weeks Turnips, but this frosty weather has caused them to disappear more rapidly than we had calculated upon. The general lambing will begin about the 15th of April, though a few Cheviot and black-faced ewes, with crossed lambs, to be fed in the enclosures, will drop theirs 10 days earlier. The dry weather has been exceedingly favourable to heather burning, and where tenants are not wholly prohibited from burning, or limited to a small quantity, from a mistaken idea, on the part of some landlords, that the game will thereby be greatly increased, we believe a much larger breadth than usual has been burnt under very favourable circumstances. The work on the arable part of the farm has consisted in the sowing of Oats after Grass; ploughing, sowing Oats, and harrowing after Turnips as soon as these are cleared off by the sheep; carting out manure for Turnips, and covering up the dunghills with earth. The cows and young cattle are receiving a limited supply of Turnips with Oat straw and coarse meadow hay. The milking calves, besides their milk, get as much Clover hay and Swedes as they can consume. *A Lammermuir Farmer.*

Sussex Farm, *April* 8.—We have now finished sowing Oats and Barley, and we are engaged sowing the remainder of the Tares and seeds amongst the Oats, Barley, and Wheat, harrowing and rolling the same, and preparing the land for the Mangolds, which we shall plant this week, if fine. We shall also plant the remainder of the Potatoes this week. We are also harrowing and cross-ploughing the land for Swedes. With the late fine showers the Peas and Beans come up beautifully. Men are engaged with the Mangold Wurzel and Potato planning, threshing Wheat and Oats, cleaning out ditches, sharpening Hop poles, poling Hops, draining, &c. Women are picking Couch off Mangold Wurzel and Potato land, and stones off Wheat and seeds. *J. B.* [We shall endeavour to have the subject of corn rents discussed soon.]

Notices to Correspondents.

Belgian Fire-places: *A B.* Your bookseller will obtain the work of M. Jules Norsain for you. Apply to Bailliere, 219, Regent-street, London.

Cheap Sheds: *J W B.* You will find one described at page 25 of our volume for 1844.

Epsom Salts: *E Jones.* Broadcast, over 1½ or 2 acres in wet weather.

Oats: *J L H L.* You should have applied to Mr. Lawson. Black Tartarian Oats may generally be had at least 2*s.* 6*d.* per quarter cheaper than better kinds.

Roofing Tiles: *R W* asks for a receipt for glazing roofing tiles.

Rooks, &c.: *Speed the Plough.* You must shoot them down in winter time. But you had better have a bird-keeper while the Oats are brairding.

Rural Chemistry, by R. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

White Belgian Carrot: *F Pine.* On a good loamy soil, tilled deeply, and rolled to considerable firmness, sow 5 lbs. of seed per acre in rows 18 inches apart on the flat. Mix 2 bushels of ashes with the seed, and sow with the common Suffolk drill, set to deliver 2 bushels; taking the weights off the coulters, or you will bury the seed. If the land be apt to grow Chickweed, &c., sow some Oats with the Carrot-seed; they will come up and show the position of the rows, so that you can hoe between them before the Carrot seed comes. It is a profitable crop for sale, if you are placed well as to market. It is time the seed were sown.

Wine: *An Old Subscriber.* An attempt to make wine by the addition of "2 gallons of new beer," must prove a failure. Beer, and the yeast of beer even, are deprecated by M'Culloch and all experienced makers of wines, and though such a mixture might ferment, certain it is that the product could not be a wine. As circumstances are, it should appear that no alternative exists but to try to convert the fluid into a vinegar by exposing the vessel to the full sun under an open shed, the bung-hole being covered with a piece of tile or slate. Wine can only be made from Grapes. A liquor called by some malt-wine has been made from pure and rich sweet-wort; but though pleasant if well manipulated, and fermented by the lees of wine (not yeast), it still is not a true wine. *J. T.*

Markets.

SMITHFIELD, Monday, April 8.

The supply of Beasts is very large to-day; prices are lower, owing to the glutted state of the dead markets and the warm weather. We are also more plentifully supplied with Sheep; trade is exceedingly dull at lower rates. Shorn Sheep are now more readily sold than those in the wool. Lamb is more freely disposed of than on Friday, but 6*s.* is an extreme quotation. Trade is dull for Calves at Friday's prices. From Holland and Germany there are 210 Beasts, 390 Sheep, and 55 Calves; from Scotland, 400 Beasts; and 2600 from Norfolk and Suffolk.

Beasts, 3795; Sheep and Lambs, 23,950; Calves, 111; Pigs, 250.

Friday, April 12.

We are but moderately supplied with Beasts; however, the trade is so bad that it is difficult to effect sales, and 3*s.* 4*d.* continues to be an extreme quotation for choicest descriptions. The number of Sheep and Lambs is a fair average; trade is exceedingly dull, and Monday's quotations are barely reached. Good Calves are plentiful; they suffer a reduction in price of fully 2d. per 8 lbs. From Germany and Holland there are 78 Beasts, 70 Sheep, and 134 Calves; from Scotland 200 Beasts; and 125 Milch Cows from the home counties.

Beasts, 762; Sheep and Lambs, 6500; Calves, 296; Pigs, 235.

POTATOES.—Southwark, April 8.

The Committee report that since our last report the arrivals from the Continent have been very extensive—above 4000 tons. So large an arrival has caused a depreciation in the value of foreign Potatoes. Yorks being scarce are selling at better prices. The following are the present prices:—York Regents, 80s. to 110s. per ton; Scotch do., 70s. to 80s.; Scotch cups, 50s to 60s.; Scotch whites, 40s. to 45s.; French whites, 55s. to 65s.; Belgian do., 40s. to 55s.; Rhenish do., 40s. to 55s.; Dutch, 40s. to 45s.

COVENT GARDEN, April 13.

Vegetables are well supplied, but many kinds of Fruit are still scarce. A few Strawberries have made their appearance. Hothouse Grapes are not very plentiful. Pine-apples are scarce and inferior in quality. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some very good Broccoli in the market. Potatoes are unaltered since our last account. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb are becoming very plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Almonds, per peck, 6s
Grapes, Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s

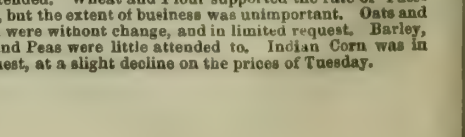
HOPS.—Friday, April 12.

Messrs. Pattenden and Smith report that the market continues much the same; new Hops and fine yearlings are scarce.

MARK LANE.



Monday, April 8.—Notwithstanding the supply of English Wheat by land carriage samples to this morning's market was small, it met a slow sale at a decline of 1*s.* to 2*s.* per qr., and some remained unsold at a late hour. For foreign the inquiry was of a languid and retail character, and little progress could be made with sales at even a reduction of 1*s.* per qr.—English Barley is unaltered in value; good foreign commands rather more money.—Beans and Peas remain as last quoted.—The Oat trade is heavy, at a decline of 6d. per qr.

Friday, April 12.—The arrivals of grain from abroad this week have been considerable, which induces buyers to act with great caution, and business is on the most restricted scale. We observe no alteration in the value of English Wheat, but to have effected sales of foreign a decline of 1*s.* per qr. would have been submitted to.—Barley, Beans, and Peas remain nominally the same as on Monday.—Oats are a slow sale at a reduction of 6d. to 1*s.* per qr.—The Wheat trade throughout the country for the past week has been exceedingly dull, and sales have been very generally effected at a reduction of 1*s.* per qr. Business in spring corn has also been very limited, and prices are almost nominal. In the Baltic prices appear to be fully maintained, purchasers for Scotch and Dutch account at Konigsberg and London account at Rostock having imparted rather an upward tendency.

Fluctuations in the last six weeks' Corn Averages.

Liverpool, April 12.—The market this morning was slenderly attended. Wheat and Flour supported the rate of Tuesday last, but the extent of business was unimportant. Oats and Oatmeal were without change, and in limited request. Barley, Beans, and Peas were little attended to. Indian Corn was in fair request, at a slight decline on the prices of Tuesday.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, April 18th, a first-rate collection of Carnations and Picotees, a very choice assortment of Dahlias, Verbenas, Fuchsias, Heartsease, Pinks, Geraniums, &c.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

NEW ORCHIDS.

MR. J. C. STEVENS begs to announce the return of Mr. WARSZEWIEZ, from Veragua; he has brought with him a most choice collection of ORCHIDS, comprising many perfectly new things in Acineta-, Odontoglossum, 2 very fine Cycnoches, 14 different species of Mormodes, most beautiful Huntleyas, Trichopilias, Sobralias, with a most magnificent new Cattleya, besides splendid specimens of known species, which will be sold by Auction, at his Great Room, 38, King-street, Covent-garden, on THURSDAY and FRIDAY, 18th and 19th inst.; together with a fine collection from Guatemala, of Barkeria spectabilis and Skinneri, Lycaste Skinneri, &c., which have just arrived.—Catalogues will be forwarded.

ORCHIDS—THE COLLECTION OF A GENTLEMAN.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent-garden, on WEDNESDAY, the 24th April, at 12 for 1 o'clock, the Collection of ORCHIDS of a Gentleman giving up growing them. The plants are all well established, and in good health, and consist of the best varieties of Aerides, Cattleya, Dendrobium, Oncidium, Odontoglossum, Stanhopea, Vanda, &c., some of which are specimen plants, particularly a mass of Miltonia spectabilis.—May be viewed the day prior and morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

MESSRS. WINSTANLEY AND SONS, of Liverpool, will sell by Auction, on MONDAY, April 22d, at 4 o'clock in the afternoon, at Shotton Farm, one mile from the Queen's Ferry Station on the Chester and Holyhead Railway, and seven miles from Chester, A SIX HORSE-POWER STEAM ENGINE, with Boiler complete, suitable for, and at present working, a Threshing Machine, &c.; also a Flax-rolling Mill and a Flax Scutching Mill, of the most improved construction. They may be viewed two days previous to the sale.

EXTENSIVE PUBLIC SALE OF PLANTS AT UTRECHT (HOLLAND).—On MONDAY, April 22, and following days, from 10 o'clock in the morning till 3 o'clock afternoon, will be offered for Sale, a considerable quantity of different PLANTS and EXOTICS, consisting of Hothouse Plants, Cactuses, and splendid Palm-trees, besides a magnificent collection of Orange-trees, Acacias, Azalea Indicas, Banksias, and Dryandras, of different sorts; beautiful Epacrises, Ericas, Pelargoniums, and also a great variety of other precious Flowers, described in the Catalogue. The whole forthcoming from the stock of the late Mr. G. DE GROOT, of Utrecht, Florist to his Majesty. Three days previous to the Sale the Collection may be examined.—For the Catalogue, and further particulars, apply to Mr. E. L. GLINDERMAN, Auctioneer, at Utrecht, Holland.

MAGNIFICENT GERANIUMS, AZALEA INDICA, CARNATIONS, FUCHSIAS, HERBACEOUS PLANTS, SEEDS, PILLAR AND OTHER ROSES, CREEPERS, &c.

MR. HASLAM will sell by Auction, at the Mart, on THURSDAY, April 18, and FRIDAY, April 19, as above.—Catalogues may be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping.

TO FLORISTS AND OTHERS.

TO BE SOLD, very cheap, the LEASE OF A NURSERY, within two miles of London, containing 1 acre of ground, together with two good Dwelling-houses let to respectable tenants, which nearly covers the rent of the whole. The Lease can be taken with or without the Stock (wholly Pot Plants) and Glass, or with a part thereof, to suit the convenience of the purchaser.—For particulars apply, if by letter post paid, to A. B., 14, Sommerford-grove, Stoke Newington-road, near London.

TO MILLERS, FARMERS, AND OTHERS.

MONEY.—The Advertiser (a Miller and Flour-factor), having an extensive Connection in London and its vicinity, wishes to meet with a party who can advance from 3000*l.* to 4000*l.*, to be employed in the Trade, by Partnership or otherwise. This is a safe and profitable Investment, and the present is a peculiarly favourable time for embarking in the above line of business.—Apply by letter, with real name and address, to Mr. SIMMONS, 49, Gracechurch-street, London.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

GLASGOW SHOW, 31st JULY, and 1st and 2d AUGUST.

SWEEPSTAKES FOR SHORT-HORN BULLS.

Notice is hereby given that the period of Entry for the Sweepstakes is extended to the 1st of June. The Entry is open to England and Ireland, and to Animals which have already carried the Society's first Premium. All other Entries of Stock, Implements, &c., must be made on or before the 20th of June. Copies of the Premium List, Regulations, and Forms of Entry, to be had on application to JOHN HALL MAXWELL, Secretary,

Edinburgh, 6, Albyn-place, April 13.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, and more durable and elegant than any other Fence hitherto introduced.

COPPER WIRE HOTHOUSE SASH LINE.

LIGHTNING CONDUCTORS.

GILT AND PLATED CORD FOR HANGING PICTURES.

Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

DR. NEWINGTON'S HAND-DRILL HOES, with their various fittings; Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles, Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red-lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—GEORGE NEIGHBOUR and SON, 127, High Holborn, London.

"Nutt on Bees" (6th edition), now published.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

GLASS FOR CONSERVATORIES.

JAMES PHILLIPS AND Co. have the pleasure to hand their New List of Prices of GLASS for Cash.

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

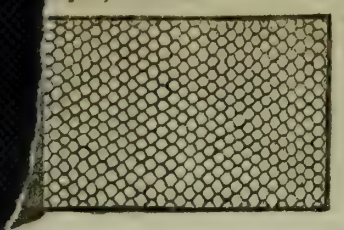
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S



Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

IMPORTANT TO AGRICULTURISTS.—COLLECTION AND DISTRIBUTION OF MANURES.

STRATTON'S AGRICULTURAL REPOSITORY, BRISTOL.

STRATTON, HUGHES, AND CO., have now ready their PATENT TUMBLER CART for the collection of Night-soil and other offensive matters; also their Iron Mill, to be worked by horse-power, water-power, or steam, for mixing and incorporating Nightsoil with Charcoal and other deodorisers. The Tumbler Cart has an iron body with a close cover; can be fitted if required as a Watering-cart, with a Valve and Delivery Pipe for distributing water or liquid manure, and also with an Apparatus for distributing dry manures in any given quantities per acre.

STRATTON, HUGHES, and Co.'s Tumbler Carts are used for scavenging purposes in Manchester, Bristol, Worcester, Harwich, Rochford, Cardiff, &c., and they are now building them for Chester, Oxford, Huddersfield, &c., besides many for Agricultural Colleges and private individuals. STRATTON, HUGHES, and Co.'s new illustrated Catalogue of Carts, Waggons, and Agricultural Implements will be forwarded to any address on receipt of 1s. 6d. in postage stamps.

HALLIMAN'S FRUIT PROTECTOR, Registered March 22d, 1850, was offered, for the first time, March 2d, 1850; was patronised by Richard Holland, Esq., 42, Grosvenor-square, London; and was shown in private at Buckingham Palace, 13th March, 1850, and returned with a satisfactory written reply. It has been named the Fruit Preserver, and pronounced to be an article of great utility by a great number of first-rate Noblemen's Gardeners. The interest of the money laid out will not amount to more than ½d. per Peach, Grapes 1d. per bunch, per year. C. H. will be thankful to receive any order, and will complete it as soon as it is in the Sole Inventor's power. — C. HALLIMAN, 1, Queen's-place, Norland-square, Kensington, Middlesex.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.

The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

AUSTRALIAN NEW LINE OF PACKETS.—The first of the above line is the ALBATROSS, of 1026 tons register; a new ship, launched in January, frigate-built, sails remarkably fast, and will be despatched on the 30th of April, for Adelaide, Port Phillip, and Sydney, New South Wales. Her accommodations are superior to anything yet despatched from this port. For terms of freight or passage apply to GIBBS, BRIGHT, and Co., 1, North John-street, Liverpool.

PHLOX DRUMMONDII JARRETTII.

GARAWAY, MAYES, AND Co., beg to announce that they are now prepared to supply this charming and distinct variety, which far surpasses any other yet sent out. The flowers are very large, and of an excellent form; the colour a beautiful rosy lilac, with white centre, and, like the other varieties, it continues in bloom throughout the whole of the summer and autumn months; a property which makes this tribe so desirable for bedding purposes. Good plants 15*s.* per dozen, or 1*s.* 6*d.* each.

As a further proof of its merit, the following opinions are quoted from the *Gardeners' Chronicle*, and the "Gardeners' and Farmers' Journal."

"PHLOX: J. P.—Flowers rosy lilac, white in the centre, large in size, and bright in colour; a very nice variety and remarkably handsome."—*Gardeners' Chronicle*, Oct. 6, 1849.

"PHLOXES: J. P., Bath.—A superb variety of a reigning favourite. This class of plants is rapidly improving, and though we have had some very beautiful specimens submitted to us during the season, we are free to confess your seedling totally eclipses them, with one exception. We do not remember having noticed a Phlox under your initials previous to the present moment, but if our memory serves us aright we have had a variety closely resembling the one before us, forwarded for our opinion early in the season. Be this as it may (for we have not time to refer), it does not deteriorate from the beauty of your flower, which is first-rate in its properties. Form good, petals flat, smooth on the edges, of desirable consistency, and brilliant; colour rosy lilac, bordering on peach blossom; centre pure white, beautifully blotched with light puce; eye circular, and distinct, size of the pip very large, and a noble trusser."—"Gardeners and Farmers' Journal."

G., M., and Co. beg likewise to recommend two other good and distinct varieties, viz., Phlox Drummondii atropurpurea: flowers of a good form; colour dark purplish carmine, with the centre almost black, forming a good contrast with the former and following variety.—Phlox Drummondii oculata: pure white, with rosy lilac eye; very pretty, 6*s.* per dozen, or 9*d.* each.

A Descriptive Catalogue for this season, containing their choice collections of Dahlias, Geraniums, Verbenas, Pansies, Greenhouse, Stove, Orchidaceous and Miscellaneous Bedding Plants, is now ready, and will be sent on application.

Durdham Down Nursery, Bristol, April 13.

CHEAP GERANIUMS, FUCHSIAS, CINERARIAS, AND PERPETUAL BLOOMING ROSES.—Fine healthy plants of GERANIUMS (including all the most popular varieties), fit for beds, or late bloom in the greenhouse, 6*s.* per dozen, or 42*s.* per 100; stronger plants, 9*s.* per dozen, or 63*s.* per 100; large bushy plants, showing bloom-buds, 12*s.* per dozen, or 84*s.* per 100.

CINERARIAS of all the most popular varieties, at the same prices as the above, according to strength of plants, and they are remarkably fine, just coming into bloom, and cannot fail to please any one. There is a great variety of colour amongst them, and they would make the greenhouse gay for a length

The FUCHSIAS are the best sorts in cultivation, and are last year's plants, and will average a foot in height at least, and are breaking into growth in every part of them. They have been wintered in a cold frame, and are quite hardy enough for turning out into beds at once, or for pushing forward in the greenhouse. Prices the same as for Geraniums, or smaller plants will be supplied at 4*s.* per dozen, or 30*s.* per 100.

The PERPETUAL BLOOMING ROSES are also fine strong healthy plants, of the best sorts, and this is the best season for planting them out into beds. The prices of these will be from 9*s.* to 12*s.* per dozen.

Also all the best VERBENAS for bedding. Autumn struck plants 5*s.* per dozen, and spring struck plants 3*s.* per dozen. Can be sent per post.

Every other description of bedding plants in fine condition, at equally low prices.

DAHLIAS from 4*s.* per dozen upwards.

The above prices do not include package, &c., which, for strong plants, will average 1*s.* per dozen, and for postage plants 6*d.* per dozen. The selections in every case to be left to THOS. APPLEBY, Rose Mount Nursery, York.

N.B. Catalogues may be had on application, inclosing two stamps. Prepayment, or references, is respectfully requested.

WILLIAM GREGORY begs most respectfully to offer the undermentioned NEW FUCHSIAS and GERANIUMS.

SPLENDID NEW FUCHSIAS.

To be sent out the first week in May next.

DIANA.—The purest white Fuchsia yet introduced; a pure white tube, of wax-like consistency, stout and well proportioned. Sepals slightly tinged with pale blush, tipped with a pretty shade of green; corolla brilliant scarlet, flushed with crimson at the extremity. Price 10*s.* 6*d.* each.

ACTÆON.—An extraordinary fine large dark flower, tube and sepals of rich crimson, the sepals measuring 4 inches across, placed horizontally; corolla very large, bright purple, and of the beautiful barrel shape, so desirable; a very free bloomer, and of excellent habit; confidently recommended. Price 10*s.* 6*d.* each.

CORINIUM.—A well-shaped dark flower, tube and sepals bright crimson, of desirable consistency; corolla beautiful rich purple, a free bloomer, and of rather dwarf habit. Price 7*s.* 6*d.*

CHOICE SEEDLING GERANIUMS.

A few strong plants remain.

LUCILLE BELMONT.—Of very dwarf habit, a free bloomer, upper petals blotched with dark puce, the lower petals striped with the same colour; good for bedding or pot culture. Price 7*s.* 6*d.* each.

LUCIA ROSEA COMPACTA.—A seedling from Lucia rosea, a great improvement upon its parent, being a very free bloomer, of a compact habit of growth, well adapted for bedding or pot culture, and as a Rose-coloured Geranium, not surpassed. Price 5*s.* each.

*** The usual discount to the trade upon all the above.

Royal Nursery, Cirencester, April 13.

This advertisement will not be repeated.

Removed to No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 13, 1850.

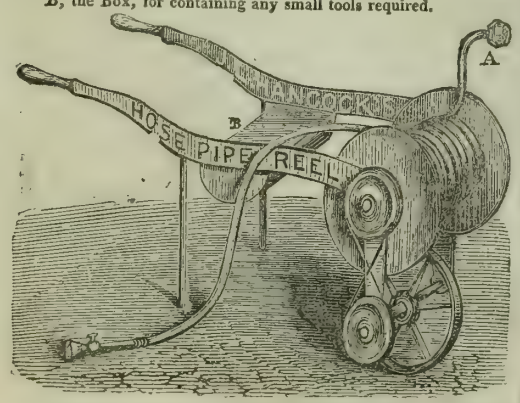
CROSSKILL'S PATENT ROLLER.—For Rolling Spring Wheat, Growing Crops, Grass Lands, Compressing Soft Soil, and Crushing Clods. Prize Patent Wheels, Carts, and Waggons—awarded 30 sovs. prizes at Norwich. Prize Portable Farm Railway, will pay its cost the first year, &c. &c. On receipt of six penny postage stamps, a new Illustrated Newspaper and Catalogue will be sent gratis per post, with full particulars of the newest and best Field, Road, and Barn Implements, now kept in Stock, for delivery from Hull by water or rail to all parts of the kingdom.

Address Mr. CROSSKILL, Iron Works, Beverley.

FLEXIBLE INDIA-RUBBER HOSE PIPES.



JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.

B, the Box, for containing any small tools required.

L. HANCOCK invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.

"SUNSET" VERBENA.

MESSRS. JEYES AND CO. have much pleasure in offering for Sale the above Verbena. The two eminent growers named below have described its character.

"Your Verbena 'Sunset' is quite distinct from any other scarlet. Its habit for bedding is the best we know of. The name is well applied, for a mass of its flowers has all the appearance of a declining sun.—DANIEL JUDD, Gardener to the Right Honourable Earl Spencer, K. G.; WALTER GREY, Gardener to the Right Honourable Sir James Parke."

Plants 5*s.* each; if two are ordered three will be sent.

P.S.—The Prices of the Rare Flower Seeds advertised and described in this Paper of March 9 are—Hibiscus speciosa, 2*s.* 6*d.*; Æthionema membranaceanum, 6*d.*; Myosotis azoricus, 2*s.* 6*d.*; Pentstemon Murrayanum, 2*s.* 6*d.*; Calandrinia umbellata, 2*s.* 6*d.* per paper.—Northampton, April 20.

NEW FUCHSIAS, CHEAP, CHEAP!—Twelve of the following splendid new FUCHSIAS for 12*s.*; Six for 7*s.* 6*d.*, post free, viz.:—Alboni, Chateaubriand, Caractacus, Elegantissima, Elegans, Fire-king, Gem of the West, General Negrier, Lord Nelson, Model, Newtonensis, Perfection, Sapphire, Splendida, Sir C. Napier, Isabella, President, and Gem; if including Spectabilis, 15*s.* per dozen. Strong plants sending out. The finer older varieties at 5*s.* per dozen. It is requested that all orders be prepaid.—Apply to HENRY WALTON, Edgend Marsden, near Burnley, Lancashire.

Descriptive priced Catalogues for one stamp.

EARLY AND CATTLE CABBAGE.—A stock, not to be equalled, of 400,000 stout bedded plants, superior true sorts, 4*s.* 6*d.* per 1000; also fine bedded Red for pickling, 1*s.* per 100, or 7*s.* 6*d.* per 1000, package included, delivered free of carriage to the Edenbridge station, South Eastern Railway. Address to JOHN CATTELL, Westerham, Kent. Cash expected from unknown correspondents. Seed of CATTELL'S superior "Dwarf Barnes," and his new "Dwarf Reliance" Cabbage may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter half an ounce.

J. C.'s Annual Catalogue of Plants, for the spring of 1850, is now ready, and may be had by inclosing, with address, 1*d.* stamp.

RENDLE'S NURSERY ESTABLISHMENT, PLYMOUTH.

ESTABLISHED 1786.

All orders above 2*l. will be delivered free of carriage to any station on the Great Western, Bristol and Exeter, or South Devon Railways; or to any borough town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.*

*** To prevent disappointment, we hope that all Orders will be sent to us as EARLY AS POSSIBLE; we shall then be able to supply all the sorts enumerated in this List; but if they are delayed, we fear that we shall be deficient in some instances, having only a limited supply of some sorts. Orders will be attended to in strict rotation.

Great attention is at all times paid to CAREFUL PACKING. We have sent a great number of Plants to the North of Scotland and Ireland, and they have arrived in most excellent condition.

RENDLE'S CHEMICAL PLANT MANURE.—This is a most valuable and stimulating MANURE for growing Flowering Plants in pots or in the open ground. It is perfectly harmless in its composition, and will not burn the roots like Peruvian Guano. It is particularly dry and clean, and free from obnoxious smell; in fact, no lady would object to use it in her Conservatory or Drawing-room.

FOR POTTING.—About *one-tenth* portion should be mixed with *nine-tenths* of soil. This will be found a most excellent Manure for growing Geraniums, Camellias, Roses, Fuchsias, Verbenas, Cinerarias, and all fast-growing plants. It is more particularly valuable for growing Hyacinths, Tulips, and other bulbous roots.

FOR THE OPEN GROUND.—A small portion should be incorporated with the soil previous to the plant being put in; this will give an excellent effect to the growth of Roses, Dahlias, Fuchsias, Verbenas, &c., as well as for American Plants, and all other Ornamental Shrubs.

Sold in Tin Canisters, at 2*s.*, 3*s.* 6*d.*, and 5*s.* each; or in Wooden Boxes, at 10*s.* each.

This valuable Manure is specially prepared for us by one of the leading Agricultural Chemists of the day, and has given the greatest satisfaction to all who have used it, and can with the greatest confidence be recommended.

WILLIAM E. RENDLE AND CO., PLYMOUTH.
Counting House, Union-road.
ADJOINING THE PLYMOUTH STATION AND TERMINUS OF THE SOUTH DEVON RAILWAY.

*** AGENTS REQUIRED IN ALL THE PRINCIPAL TOWNS.

Their Descriptive Spring Catalogue is just published, and will be forwarded free on receipt of two postage stamps. It will be found indispensable for the present season, as it contains all the latest deserving introductions (home and continental), in obtaining which no expense has been spared in forming a selection of such as will prove satisfactory.

Great Yarmouth Nursery, Norfolk.

DELPHINIUM MAGNIFICUM, figured in "Paxton's Magazine of Botany" for October, 1849. This fine hardy Delphinium must be seen to show its great superiority over every other Larkspur yet grown, in the intense brilliancy of its blue; either in the flower garden or in the bouquet, it at once arrests the attention by its vivid colouring and fine habit. Good established plants ready to send out on the 10th of May, at 10*s.* 6*d.* each. The usual allowance to the trade when three or more are taken.

Rose Geant des Batailles, 20*s.* per dozen.
" Pius the 9th, Sydonie, Cymedor, &c.
A. GODWIN, Eycroft's Nursery, near Ashbourne.

BASS and BROWN'S Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW AND UNRIVALLED SEEDLING FUCHSIAS, "YORKSHIRE ECLIPSE," "BEAUTY OF RICHMOND," AND "DISTINCTUS."

WM. RUMLEY AND SONS have great pleasure in announcing to the Nobility, Gentry, Nurserymen, and the trade in general, that they intend sending out the above Splendid Seedling FUCHSIAS on and after the 7th of May; they can confidently recommend them as the most beautiful, distinct, and showy varieties yet sent out, and their undoubted merits must insure satisfaction to every purchaser. For Dr. LINDLEY'S opinion, see *Gardeners' Chronicle* for Aug. 18, 1849, p. 520, under the initials "G. R—y."

No. 1. YORKSHIRE ECLIPSE.—A large, elegant, and handsome variety; its stout and robust habit, combined with the graceful form and novel colours of the flowers, contribute to render it a most desirable addition to those in cultivation. It is also an abundant bloomer, and one of the most showy varieties yet sent out.

Dr. LINDLEY'S opinion, August 18: "No. 1. Tube pale blush; lobes the same colour, tipped with green at the points, broad and well expanded; corolla bright orange purple; petals small in proportion and rather narrow; a nice waxy light-coloured variety, good in size, with well contrasted colours." 10*s.* 6*d.* each.

No. 2. BEAUTY OF RICHMOND.—This matchless variety is perfect in every respect; its excellent habit and ample foliage tend to show off the flowers, which are of the finest glossy texture, and produced in great profusion to the utmost advantage. It has long been considered that a Fuchsia, possessing the peculiar properties of Venus Victrix, of large size, would be a great desideratum, and in this fine variety we have this desirable result realised.

Dr. LINDLEY'S opinion, August 18: "No. 2. Tube and lobes white, stained with pale purple; corolla deep violet; texture, shape, size, and colours good; a nice variety, with the colours of Venus Victrix; the best of your seedlings." 10*s.* 6*d.* each.

No. 3. DISTINCTUS.—A novel, distinct, and beautiful variety; tube and sepals of the finest rosy red; the sepals beautifully expanding, with deep violet-blue corolla, of excellent habit and free bloomer, and has been greatly admired by all who have seen it.

Dr. LINDLEY'S opinion, August 18: "No. 3. Flowers small, with very long reflexed lobes, and remarkably short corolla; a neat and singular shaped little flower, with bright, well contrasted colours." 7*s.* 6*d.* each.

WM. RUMLEY and SONS have also to offer at the same time the following Splendid New Seedling PETUNIAS and ANTIRRHINUMS, which they can with the greatest confidence recommend as first-rate and very distinct.

PETUNIA,	"Gem of the North,"	3*s.* 6*d.*
"	"Attraction,"	3 6
"	"Rosea Superba,"	2 6
ANTIRRHINUM,	"Crimson King," ...	5 0

For full description of the above, and also Dr. LINDLEY'S opinion, see Catalogue, which may be had on application.

The usual allowance to the trade. Orders will be executed in strict rotation as received. From unknown correspondents a remittance or Post-office order, payable at Richmond, is respectfully requested prior to the plants being sent.

Gilling, Richmond, Yorkshire.

CHOICE SEEDLING PETUNIAS.—We have the pleasure to offer the following varieties of our own raising, which have been selected as first-rate from a large number of other Seedlings, and we trust will give equal satisfaction to the varieties we have hitherto sent out. To be sent out on April 20.

Magnificent, a fine rich crimson, colour and shape of "Brilliant" sent out last year, but having darker veins	5*s.* 0*d*
Castor, a large and distinct lilac, with a very rich dark purple throat	3 6
Pollox, a large silvery blush, with a dark rich purple throat	3 6
Orion, a rich lively crimson lake, of fine form	3 6
Syren, pure white, with a rich bright pink throat, good round form	3 6
Cassandra, French white, lilac pink throat, veined, edges of the corolla blotched with lively pink, large and fine	3 6

The usual allowance to the trade by taking the set, or for three plants of a sort.

12 new varieties of last season	12 0
12 superior varieties	9 0
12 fine ditto	5 0
25 varieties in choice assortment	15 0

The above free by post if required.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

PROFESSOR EDWARD FORBES, F.R.S., will deliver a Course of Lectures on BOTANY for LADIES, at Queen's College, London, during the present term. The Introductory Lecture will be given on Tuesday, 23d April, 1850, at 4 o'clock, to which the admission will be by tickets, to be obtained at the College, 67, Harley-street; or at the office of the Governesses' Benevolent Institution, 32, Sackville-street. —Fee for the Course, 1*l.* 11*s.* 6*d.*

GERANIUMS.—Splendid plants in 48-sized pots, of popular sorts, 12*s.* to 24*s.* per doz. Selection to be left to ourselves.—H. LANE and SONS, The Nurseries, Great Berkhampstead, Herts. Catalogues may be had.

FLOWER SEEDS FREE BY POST. — One Hundred packets of the newest and best sorts for 18*s.*; Fifty for 10*s.*; Twenty-five for 6*s.* Selection can be made from RENDLE'S Descriptive Catalogue of Flower Seeds.

GERMAN SEEDS.—*We have a large stock of all the best varieties* (*See our Advertisement, page* 177, *March* 23, "Gardeners' Chronicle"), *including Stocks, Asters, Wallflowers, Balsams, Larkspurs, Hollyhocks, Zinnias, &c.*

For particulars apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth. Established 1786.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

GRASS SEEDS.—Mixtures of selected natural GRASS SEEDS, with a proper proportion of permanent Clovers, for laying down land to permanent Meadows and Pastures, to suit the soil to be laid down. Mixtures of the above for Irrigation or Water Meadows.

Mixtures of the above for Parks or Field Lawns; Italian, Perennial, and other Rye-grasses; Long Red, Yellow Globe, and other Mangold Wurzel; Swedes (various sorts), Hybrid and other Turnips; all kinds of Grass Seeds, Agricultural and other Seeds.—THOMAS GIBBS and Co., the Seedsmen to the Royal Agricultural Society of England, corner of HALF-MOON-STREET, Piccadilly, London.

NOVELTIES AND IMPROVEMENTS IN HORTICULTURE.

STRAWBERRIES more than two ounces each in weight, and of delicious flavour, were grown last season on ROBERTS'S STRAWBERRY TILES. Celery and Cardoons of the most superb quality were produced by his Sockets, and this season he introduces a new method of growing Asparagus, which greatly improves the quality and increases the quantity of this valuable vegetable. He also gives a new method of growing Grapes, Peaches, and other Wall Fruit, and has recently registered a Ventilating Flower-pot, which will be found invaluable to scientific gardeners and amateurs.

A pamphlet giving full particulars can be had by enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London.

SEEDS! SEEDS! SEEDS!—NEW CABBAGE.

WAITE'S KING OF THE CABBAGES, the earliest and best in cultivation, has now been fully proved, and of its superiority no doubt exists. One-half of the Vegetable Seeds sent out as new are only old ones with new names; but to test the merits of this, J. G. WAITE will forward, gratis, free by post on receipt of 1 stamp, ½ oz. of the seed, sufficient to grow upwards of 2000 plants.

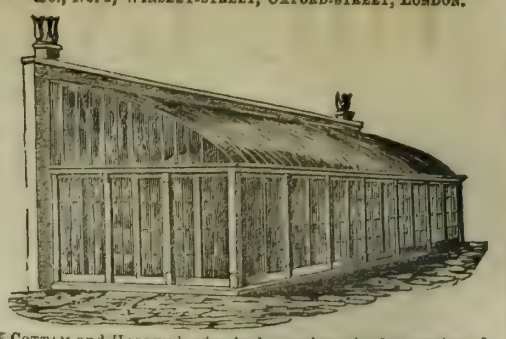
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

N.B. Catalogues of all kinds of Seeds can be had on application.

TO GRAPE GROWERS.—THE BLACK BARBAROSSA.

JOHN BUTCHER has a limited stock of the above truly magnificent GRAPE, introduced by T. C. Ward, Esq., from the Continent, and now for the first time offered for sale. It has the following good properties: the Vine, a most luxuriant grower, a free bearer; bunches, large and finely shouldered; berries, large and globular; flavour, equal to the Hamburgh; will hang on the Vine for at least another month to come, without sinking in size of berry, or losing in flavour; as hardy as the Hamburgh. Mr. Bevington, gardener to Mark Philips, Esq., exhibited the above Grape at the Horticultural Rooms, Regent-street, London, January, 1849, for which a Certificate was granted; and again on the 19th February, 1850, when a Banksian Medal was awarded it. Some idea may be formed of the magnificence of this Grape, by its being but the third year of the tree bearing fruit—21 bunches, averaging 4 lbs. per bunch, was the crop of 1849. To those families requiring late Grapes, it will prove a valuable acquisition. Good plants, from eyes, 21*s.* each, including package.—London Agent, Mr. FREDERICK WARNER, Seed Merchant, 28, Cornhill, London; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon, April 20.

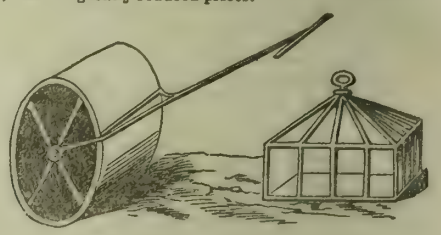
NETTING, FLAGS, AND BUNTING.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.



GARDEN ENGINES, SYRINGES, &c. CAUTION.—The well-known reputation of READ'S Engines, Machines, and Syringes, has led to the nefarious practice of placing Cards in Shop Windows, with the words "READ'S PATENT" over syringes of the very commonest description. R. READ begs to Caution the Public against being deceived by such false representations, as many of these Instruments, upon trial, will be found defective and useless.—READ'S Syringes may be known by the Royal Arms, and the words "READ'S PATENT." Manufactured only at 35, Regent Circus, Piccadilly, London.

HALLIMAN'S REGISTERED FRUIT PROTECTOR is now ready for Sale; it is highly approved of by all practical men who have seen it. This glass placed over the fruit on the common wall assists Nature in our cold climate, the fruit grows to a large size, and its richness and flavour are increased. Any order C. H. is favoured with will be forwarded at the lowest possible price for ready money. Sizes are from 3 to 12 inches; 4 inches for Peaches, in flint glass, price 5*l.* per 100; 6 inches for Grapes, 10*l.* per 100; common glass cheaper.—C. HALLIMAN, Gardener, Kensington, London.

TO NURSERYMEN, GARDENERS, and OTHERS.



PARTNERSHIP.—WANTED, by the Advertiser, a Person, with about 300*l.*, to join him as Partner in the business of a Nurseryman, Seedsman, and Florist, which has been Established upwards of Thirty Years, and is situated within three miles of Covent Garden Market. The Grounds are well Stocked, and, with the assistance of an active individual, the Business is capable of being greatly increased.—Apply by letter, stating real name and address, to Y. Z., 18, Canonbury-street, Lower-road, Islington, London.

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

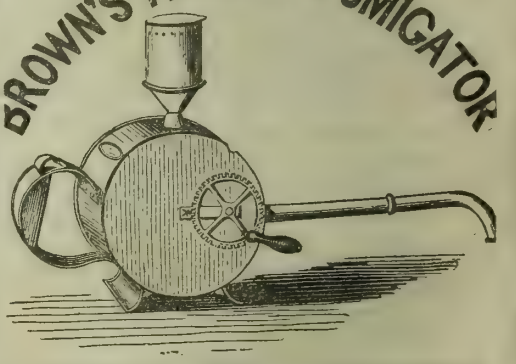
HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.

Every description of Work, both plain and Ornamental, in wrought and cast iron, for Gardens, &c. &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

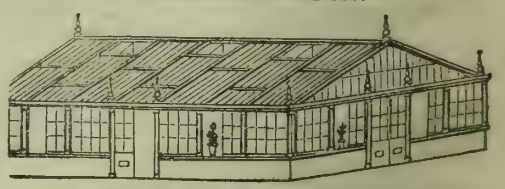


STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

THE COTTAGER'S STOVE will cook sufficient for a Family of a dozen persons with one pound of Coal or Coke per hour, and is well adapted for Emigrants.—May be seen in operation daily at the Manufacturer's, Messrs. BENHAM and SON'S, 19, Wigmore-street, and Messrs. D. and E. BAILEY, 272, High Holborn, London.

PRICE TEN SHILLINGS AND UPWARDS.



BROWN'S PATENT FUMIGATOR

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

EDWARD BECK, SLATE WORKS, ISLEWORTH.
SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.
E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.
Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.
N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

ROBERT WHIBLEY'S CATALOGUE, containing all the newest and most select Geraniums, show, scarlet, and fancy; Fuchsias, Verbenas, Antirrhinums, Petunias, Chrysanthemums, Roses, Dahlias, Phlox, Pansies, Herbaceous Plants, &c., which is worthy the attention of purchasers, and will be sent for two postage stamps. Fine plants now ready.
Nursery, Kennington, London.

IMPORTANT TO CHICORY GROWERS.—LARGE ROOTED CHICORY SEED to be had, in any quantity, at 84*s.* per cwt.
J. G. WAITE, Seed Merchant, 181, High Holborn, London.

TO NURSERYMEN, FLORISTS, &c.

J. LINDEN, FLORIST, of Luxembourg, begs to inform the above that his new CATALOGUE OF PLANTS, &c., is now ready, and may be obtained of his Agents, Messrs. Betham and Blackith, Custom House and general forwarding Agents, Cox and Hammond's Quays, Lower Thames-street, London.—April 20.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS, and has much pleasure in announcing that they have vegetated. Price 2*s.* 6*d.* per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire, near Coventry.

NGAINES begs to inform the admirers of Fancy GERANIUMS, he intends sending out on Monday next the following Seedlings: Gaines's Parodi, Lady Louisa Cornwallis, Elegans, Priam, Nina, Queen Superb, Signora Carolinii, Odoratum variegatum; also he has good strong plants of his Hero of Surrey and Cerise Unique.
On the 1st of May will be ready for delivery, his superb new Seedling DAHLIAS Lady Auckland, Empress of Yellow, Lord Hardinge, Fancy do., Princess Louisa, Hero, Desdemona, Rotundiflora, and Atalanta. Opinion of this Paper (1849), see August, No. 34; September, No. 38. Gardeners and Land Stewards' Journal, August, No. 32; September, No. 35.—A Descriptive Catalogue of the above, including Calceolarias, Dahlias, Pelargoniums, Fuchsias, Cinerarias, Chrysanthemums, Azaleas, Verbenas, Rhododendrons, &c., may be had by applying at the Nursery, Surrey-lane, Battersea, April 20.

SUPERB PICOTEE—"THE GEM."—By far the most perfect light red-edged PICOTEE yet raised, and shown in all the winning stands in the Metropolitan Exhibitions of last season, and is pronounced by all the leading publications of the day as "a perfect gem." May now be had, in fine strong plants, per post free, at 5*s.* 6*d.* per pair, or well established in small pots at 5*s.* per pair.
YOUELL and Co., Nursery, Great Yarmouth.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to offer the following superb new GERANIUMS and FUCHSIAS.
SCARLET GERANIUM "COMMANDER-IN-CHIEF."—This is decidedly the finest variety yet offered, and will no doubt prove a great favourite for many years. The foliage partakes of the beautiful transparent variegated appearance of Queen of Summer, but it is more distinctly marked, and of greater substance. In habit it is much superior and quite distinct from it, having the robust character and stout flower-stalk of Compactum, with very large trusses of orange-scarlet flowers, blooming most profusely. Plants 18 inches high, in 24-sized pots, produced from nine to 12 trusses of bloom at one time; and such is the desirable texture of the blossoms, that the truss remains perfect until all the pips are fully expanded. Plants in May, 10*s.* 6*d.* each.
SCARLET GERANIUM "EXCELLENCE."—This is also a most desirable variety, quite distinct from Commander-in-Chief, and possessing rich velvety dark foliage, strongly marked with a wide dark circle, giving it a very distinct and beautiful appearance. Its habit is stiff and compact, and throws out prominently very fine trusses of dark scarlet flowers of matchless form. It is unhesitatingly recommended as a first-rate variety. Plants in May, 7*s.* 6*d.* each.
An allowance to the Trade on each variety if three are taken.
NEW FUCHSIAS.
PRINCE OF ORANGE (HENDERSON'S), orange sepals and scarlet corolla; a fine bold flower and profuse bloomer.
FAIR ROSAMOND (HENDERSON'S), large clear white sepals and tube, rosy crimson corolla; good form, and an abundant bloomer.
DON GIOVANNI (HENDERSON'S), very large reflexed crimson sepals, with violet purple corolla; very fine, and a free bloomer; quite distinct.
SIMS REEVES (HENDERSON'S), bright rosy red sepals, and violet purple corolla; stout flower, and well adapted for pot culture; an abundant bloomer, and quite distinct.
THE PEARL OF ENGLAND (HENDERSON'S), clear pearly white sepals, with scarlet corolla; distinct, and very desirable.
GRAND MASTER (HENDERSON'S), crimson sepals, and extra large violet purple corolla; distinct, and a free bloomer; very desirable.
CONFIDENCE (HENDERSON'S), dark crimson sepals, with purple corolla; a fine noble flower, and quite distinct; a free bloomer.
The above set 30*s.*, or 5*s.* each, with the usual discount to the Trade. Plants now ready.
Wellington-road Nursery, St. John's Wood, London, April 20.

The Gardeners' Chronicle.

Westminster Medical ....8 P.M.
COUNTRY SHOW.—Wednesday, April 24: York Horticultural.

THE late DEAN OF MANCHESTER used to maintain the paradox that PLANTS DO NOT GROW NATURALLY IN THE SOIL BEST SUITED FOR THEM. The general belief of gardeners and others has always been that to judge of the mode of cultivating a plant, it is above all things needful that we should know in what sort of soil or situation it is found wild; and accordingly the rule is to grow on old walls the plants which are naturally found in such places, to keep bog plants in artificial swamps, and to make epiphytes root upon the branches of trees. The propriety of this was stoutly denied by Dean HERBERT. He contended that the reason why many plants are found in peculiar places is not at all because they prefer them, but because they alone are capable of existing there, or because they take refuge there from the inroads of stouter neighbours who would destroy them: and consequently he by no means advised the gardener to imitate, in a servile spirit, all that he saw happening in the abodes of wild vegetation.

"I saw," said the Dean, "a Crocus, a Sternebergia, and an Ornithogalum growing in contact with each other aloft on the meagre sod of Mount Œnos; but not a seed-pod of the Sternebergia could be discovered, and very few of the Crocus. In a more fertile sod they would have been choked by some stronger plant, but they would rejoice in a better soil, if protected against the oppressor. * * * The compost in which the Dutch raise their improved bulbs of various kinds is known to be (see Sismondi, des Jacinthes) a compost of humus, obtained from thoroughly-decayed Elm-leaves and dung of stall-fed cattle, and mixed with sand deposited by the sea on a bed of prostrate timber of unknown antiquity, in which there is probably nothing calcareous. Does it not then appear that the case stands thus—not that calcareous matter is essential to the growth of Crocus, or even a useful auxiliary, but that Crocus can bear the sterility of elevated calcareous mountains better than most other plants of stronger growth? If that be true of one genus, it will probably be applicable to others. * * * It will be found that Orchis latifolia, removed from the swamp, in which it struggles with other swamp-plants, will grow more vigorously where it is cultivated with less wet. The small Polygala vulgaris is stated in Mr. Babington's Manual to grow in dry pastures, having flowers either blue, white, or red. I believe the stated habitation to be only thus far true, that it does not grow in water. I do not recollect seeing it in sandy pastures; I know it well on chalk and on clay. In England it is little admired. In the alluvial and very moist meadows of Zante, near the sea, in the vicinity of Trieste, it formed a most conspicuous part of the meadow-crop at the end of May, and the beauty with which it painted the herbage was to me astonishing. It seemed that, in a warmer climate, it could endure more moisture than with us. On the slope of Monte Spaccato, where no Grass grows, large single plants of it stood in the bare soil amongst the stones, with every intermediate diversity of pearl-colour and lilac, showing evidently that the merits of that little plant under cultivation are not appreciated or known."

We believe that in this instance the views of Dean HERBERT were in perfect accordance with every well ascertained fact relating to other plants; and that one of the greatest errors that have been committed is a too servile imitation of soils. Men do not in fact distinguish between natural *accidents*, such as soil, and natural *habits*, such as manner of growth coupled with atmospheric peculiarities. It is the natural *habit* of the Java Rhododendrons to grow in a damp, hot atmosphere, highly charged with the results of frequent thunderstorms; and they will never be grown well except in the presence of such conditions or of their equivalents. But the growing upon the branches of trees is with them an *accident*, and they will probably grow better in soil; for there is nothing we believe in the anatomical condition of their roots which declares that in air alone are they capable of existing.

A very striking example of the application of this principle is given in a late number of the "Botanical Magazine." Speaking of the management of the Lace-Bark tree, Mr. SMITH says: "Mr. WILSON informed us that 'it is invariably found growing in very dry situations on marly limestone hills, where there is not a particle of earth to be seen. The young plants grow in the crevices, or *honeycomb*, as it is called, and in order to obtain them with roots, a hammer or large stone is required to break away the porous limestone.' He further adds, that 'the soil for growing it in should be composed of one-third marl or lime-rubbish; for I am persuaded that pure loam will kill them.'" But Mr. SMITH observes: "In our experience, we have never found any plant thrive by retaining it in its native soil, or in soil too closely resembling it. If we could also imitate all the various influences of climate that modify and control the growth of plants in their native localities, it might then be proper for us to cultivate the Lace-Bark tree in marly soil, like limestone; but our plants afford evidence that such soil is not required when they are grown in an artificially heated atmosphere. We have used good yellow loam, mixed with a little leaf-mould and sand. In this they have attained the height of 8 feet, and continue in a perfectly healthy state."

We are persuaded that this fact is only one of

many hundreds which would be readily discovered if attention were sufficiently drawn to them, and that gardeners cannot do better than consider very carefully what they are doing before they blindly imitate the natural soil in which a plant has been found wild.

At the meeting of the Horticultural Society on Tuesday last a question arose as to what might be the CAUSE OF THE PALENESS OF TROPICAL FLOWERS when cultivated. We know that they are very much paler than when wild. For that we have the testimony of all travellers, the drawings of all artists, the evidence of all kinds which accident or intention have been able to collect.

By some it has been thought that light is the great cause of production of colour, and so it certainly is, of green colour; but it is clear that it cannot be the agent to which we owe the development of all colours, because the blackest Grapes form naturally under the shade of their own leaves. Nor does the diminution of light in modern glass houses appear to be such as will explain the pallid state of many of the flowers that bloom there. We have long been of opinion that free access of air is quite as important to colour as free access of light, and in many cases more so; as has been shown on former occasions in the columns of this Journal. But in all probability the formation of colour depends upon some peculiar combination of favourable circumstances, of which light is one, and free air another. It now seems evident that a lower temperature than we usually maintain is also indispensable.

A new and charming plant has been brought into cultivation under the name of the "SWEET TRICHOPILE." It is an Orchid from Central America, where it was found by Mr. WARCZEWITZ, who in his drawings represents its flowers as being white with well defined *deep* rose-coloured spots. But with Mrs. LAWRENCE, Mr. HOLFORD, and Mr. LODDIGES, all of whom have flowered it, the rose exists as faint stains, and nothing more. Another plant, the "DISCOLOURED WARREA," also found by the same traveller, has become known to us, the lip of which is covered with a dull violet; but Mr. WARCZEWITZ's drawings represent it to be naturally of a rich mazarine blue. It happened that both these plants were present on Tuesday in Regent-street, where this traveller saw them. He immediately exclaimed, "These are ruined by heat; they are in the same state as we find them in the low damp hot plains of the tropics. To know what they are they must be seen on the mountain sides, where the heats are exchanged for the colder air of a considerable elevation." In confirmation of this, he produced two drawings of the Warrea; one made at an elevation of 3000 to 4000 feet, on the Volcano of Cartago, and the other from 5000 feet higher. The first was better coloured than the garden plant, but the second presented all that richness of tint to which alone the term of mazarine blue can be applied. And he assured us that the colour is ever changing as you ascend the mountains, until the clearest and deepest tone is acquired.

We would not attach too much importance to drawings, especially as regards tints represented by water-colours, which, in the most skilful hands, seldom imitate with much fidelity the blues and violets of Nature. Still less would we rely overmuch upon sketches made by a poor naturalist under circumstances of great difficulty and inconvenience. But we must say this of Mr. WARCZEWITZ that, however rude his drawings may be, they have an air of truth about them which cannot be mistaken, and that in every case where we have been able to examine into his statements we have found them faithful and honest. For this reason, without relying too much upon the exactness of colour, we entirely believe in the main fact that the "Discoloured Warrea" acquires on the mountains a purity and intensity of blue, which it does not possess in the hot low districts. And we take this to be a general as well as a particular fact.

It is very true that the rarefaction of the air at great elevations must have some effect in producing these results; and we are quite prepared to admit that as another element in the "peculiar combination of favourable circumstances" above alluded to. But we would strongly advise gardeners to ascertain for themselves whether a very considerable approach to such a fortunate combination may not be made by the use of free air, abundant light, and a lowered temperature, even although no rarefaction of the air can be possibly secured.

SAVOYS.

Of these, some prefer the small varieties, others the large; occasionally the early sorts are in request, but more generally the late. Nos. 2 and 3 are preferable sorts where only two can be grown.

1. *Early Green Curled*, alias New Early, De Milan très hâtif d'Ulm. Small, outer leaves rather plain, deep green; hearts readily, and is of excellent quality. It is considered the best for early use.

Early Dwarf Green Curled, alias Dwarf, Dwarf Green, Milan hâtif. Similar in quality to the preceding, but dwarfer.

Early Flat Green Curled, alias Milan court, nain, ou trapû. Middle-sized, very dwarf and flat-headed, deep green, tender and very good.

2. *Dwarf Green Curled*, alias Small Dwarf Green Curled, Pancalier de Touraine. Stem dwarf; leaves deep green, very rugose, much curled at the margin; hearts well, and is very good, especially after the first frosts in autumn. It is hardier than the preceding sorts, and forms a succession to them.

Large Late Green Curled, alias Large Green, Late Green, Large Late Green, Globe, Milan ordinaire, Gros Chou de Milan. Larger than the preceding, and lighter green; very rugose, and hardy.

3. *Large Green German*, alias Large Late Green, Milan des Vertus, or Gros Chou Pommé-frisé d'Allemagne. This is the largest kind of Savoy, and the best amongst the large. The leaves are plainer than in the other varieties; the head roundish, a little flattened, like a Drumhead Cabbage, which it also approaches in size. It is hardy, withstanding the frosts of ordinary winters very well.

Conical Savoy, alias Milan à tête longue. Rather small, pointed, green, hardy, of very good quality, but affords much less weight of produce than several of the preceding sorts.

Early Yellow Savoy. Middle-sized, roundish, yellow; hearts early, of tender substance when cooked, and very good, but some object to the colour.

Early Long Yellow, or Milan doré à tête longue. This, like the preceding, is an early variety, but it does not heart firmly.

4. *Yellow Curled*, alias Yellow, Large Late Yellow, White Savoy, Blœmendale, New Blœmendalers, Milan Doré, ou de Savoie. This is later and hardier than the other Yellow Savoys. It is dwarf, middle-sized, round; the leaves are pale green at first, but in winter they are quite yellow. The heart is not so compact as some, but it is of tender quality, and by many persons it is preferred, being considered much sweeter than the other kinds. *R. T.*

DISEASES OF PLANTS.

(*Continued from p.* 228.)

GENUS X. CURVATURE. *First species.* ACCIDENTAL CURVATURE.—We often observe in hedges and thickets some trees of extraordinarily crooked growth. This frequently arises from their having been when young attacked by some insect, and the injured part rendered incapable of a sufficient determination of sap to nourish it like the rest of the plant; the fibres have lost their distensibility, and *curvature* comes on. Winds, accidental blows, and still more, the readiness with which the knife is ignorantly applied to young plantations, are causes that disfigure so many fine trees, which never entirely recover these early injuries.

It is not, however, always impossible to straighten the curved stems of trees when the evil has not been allowed to remain too long. A stake, carefully driven into the ground, so as not to injure the roots, will keep the young tree straight if properly tied to it. If the stem is thicker, it may be straightened by hand, resting the knee against the curve as a fulcrum, and drawing the tree towards you till you hear a slight crack. If the tree is too large to do this, incisions will sometimes correct the curvature. Two or three vertical slits should be made on the concave side of the trunk or branch, of a length proportioned to its size. These incisions will determine a great flow of sap to the part, and in many cases the curvature will much diminish or entirely disappear. I have seen the experiment successfully tried.

Second species. CURVATURE OF THE MULBERRY.—In a Mulberry plantation it is not uncommon to see certain trees with their branches twisted and shrivelled in an unnatural way. This disease, which I called *Lordosi* in my essay on Nosology, is owing entirely to the carelessness in which the gathering the leaves is performed. Instead of picking them one by one, the branch is stripped by passing it through the hand from one end to the other. It is not thus to be wondered at if they perish entirely, or at any rate remain deformed. Careful treatment, and judicious pruning, are, of course, the means of preventing this disease of the Mulberry.

GENUS XI. FLAGELLATION, *or* THRASHING.—This is a kind of injury which may be said to be compounded of many others. The common abuse in thrashing trees to gather their fruits, for example, Walnuts, Acorns, Services, &c., by means of long poles, not only produce considerable contusions, but gives violent shocks to the branches, tearing, disbarking, or twisting them. In short, the trees are thus thrashed and injured in the most delicate as well as the most precious parts, the young shoots forming the hope of succeeding years. It suffices to examine two trees, the one which has been thrashed, the other spared. Whilst this one is vigorous, rich in fruits, majestic, and crowned by well-formed shoots, which ensure future crops, the former is languid, slow of growth, and sparing in produce. I feel unfortunately convinced that there is no persuading our peasantry to alter this practice; but I will not for that refrain from warning landowners that the thrashing is the ruin of their trees, especially of the more delicate ones, which are affected by cold, like the Walnut. Nature will generally cause the fruit to fall when ripe, or, at most, a slight partial shaking of the branches will suffice.

GENUS XII. STRIPPING OFF LEAVES.—All Mulberries are stripped of their leaves in spring, and some a second time in autumn. Elms, and not a few other trees, are also, with us, stripped in August. This is a real and fatal injury inflicted on the tree. There is no mere novice in the study of physiology who is not aware of the principal use of leaves in contributing to the nutriment of the tree, and to the ridding it of its superfluous elements; and the depriving it of these essential organs of nutrition and respiration must be productive of mischief. I well know that, for the breeding of silkworms, as well as in our method of feeding cattle, this stripping is indispensable, and I am far from recommending that it should be foregone; but I feel it incumbent on me to offer a few observations on the subject, which may be useful to the cultivator.

The general precautions requisite in the cultivation and plantation of trees should be more particularly attended to in the case of those which are intended to be stripped. Experience has now convinced us of the great folly of stripping the Mulberries twice in the year, which causes their early and rapid decay. The most careful have even adopted the practice of only gathering the leaves every alternate year, and if with this precaution the pruning down the trees can be avoided, they become all the more vigorous. If, however, circumstances require the annual stripping of the trees, the whole of the leaves should not be taken, but a few left here and there. I should add, however, that it is not enough to leave a little tuft at the end of each branch, as is the custom with some; this tuft should indeed be left, as from thence is to issue the new shoot; but I would have a few leaves also left here and there along the branches. With regard to the stripping of Elms and other trees for food for cattle and sheep, it should be delayed till the autumn. Moreover, the whole of the tree should not be deprived of its leaves at once, but the operations should be spread over four, six, or eight days, and in such manner that every part of the tree should preserve a few leaves till the stripping is completed. There is another general precept which cannot be too strongly inculcated, as to the mode of taking off the leaves, which is to avoid the ordinary careless practice of so tearing them off that the young buds are carried away with the leaves. The later the operation is delayed in autumn the less the danger.

VILLA AND SUBURBAN GARDENING.

ONE of the most lovely, as well as one of the most odoriferous plants known in gardens is the Luculia gratissima; nevertheless, we seldom meet with it in anything like perfection. In most collections, if existing at all, it presents so miserable an appearance, that even possessors of large gardens cease to care for it, alleging that it is impossible to grow it in anything like a creditable or healthy state. It is a plant that does not require a high temperature, for it comes from the cooler parts of India, and the want of success may in some instances result from its being roasted to death. A few particulars, therefore, respecting the successful culture of this truly beautiful plant may not be unacceptable to my amateur readers.

The most certain mode of increasing the Luculia is by layering. If the young shoots are slightly slit, in the manner pursued with respect to Carnations, and pegged down in a small pot an inch under the surface of the soil, they will root readily, more especially if it is layered in autumn. Young plants so produced, if carefully preserved during winter, may be grown into fine flowering specimens in one season. The situation it occupies in the house is an important point to be considered. If placed where a current of air passes over the foliage, it will dwindle and die. A quiet cool position is what it especially requires; and it should be partially shaded during bright sunshine. It will be found to luxuriate in the temperature of an ordinary conservatory, where the frost is merely kept out. I have known it to be exposed to nearly the freezing point without sustaining any injury whatever.

The soil in which I have found the Luculia to thrive best is turfy loam, with an admixture of one-fifth leaf-mould and one-fifth silver sand; let the pot be well drained, and the soil used in a rather rough state.

Few conservatory plants are more ornamental than the Luculia, and if planted out where there is no draft, it will thrive and bloom in perfection every winter. *Pharo.*

Home Correspondence.

Adamia versicolor.—Seeing in the last Number of "Paxton's Flower Garden" a representation of this plant, and an account of it, where it is spoken of as a difficult plant to flower, I think it may be worth while to mention that a plant of it, received in Sept. 1848 from the Horticultural Society, has been in flower for the last three weeks in the stove here. The flowers first showed themselves about January, and continued for a very long time (perhaps a month) previous to their expanding without changing at all, except that the buds altered from a white by degrees to a sort of pale blueish violet, when they began expanding, and have continued ever since to be a great ornament, though all the buds have not expanded, and I fear never will. The plant is now showing another head of flowers at the side, lower down the stalk, and one out of two cuttings struck last year is showing another head. I am not aware that it received any very particular treatment. It has been kept in a Vinery, where it has always seemed perfectly healthy until removed when in flower to the

stove. It certainly is a great ornament, and is a new style of flower among stove plants. If any of your readers would wish for any further particulars concerning its treatment, our gardener, Mr. Law, under whose care it has flowered, will, I am sure, be ready to give them. *James Stuart Wortley, Wortley Hall, Sheffield.*

Bleeding Roots of the Birch-tree.—Can any of your readers mention a remedy for the bleeding of the roots of a very fine Birch tree, standing in a most conspicuous place on our lawn, which were cut through in making a new walk near it? They are about five in number, and average about 1½ inch in diameter, and have been bleeding so incessantly for the last fortnight, that the walk has been quite standing in puddles, and the sap still bubbles up through the gravel. Do you think it will materially injure the tree? *James Stuart Wortley.* [This is a very curious case. Why do the *roots* bleed? When the Russians invested Hamburgh at the close of the last war, the Baschkirs killed the Birch trees for the sake of the wine that could be made from the sap, by bleeding them to death, but we never heard of the roots being tapped. An interesting physiological question is involved in this matter; and we should like to hear of similar occurrences.]

Employment of Waste Steam in Heating Glass houses.—The heating of frames and forcing houses with waste steam has the appearance of utility, but I am afraid it will not answer. A friend of mine, who has an extensive factory in this neighbourhood, has fitted up a very nice little greenhouse with pipes and tank, all of which he can heat at pleasure to any temperature, by simply turning a cock from the waste steam pipe; so far so good. Nothing could be better. Top heat and bottom heat all for nothing. On calling however to see my friend's little conservatory on the Sunday, I found to my surprise the frost on the glass, and the plants looking as miserable as could well be imagined. A few words explained all—the great pot was not boiling—and it would have cost more to heat it for the 24 hours of the sabbath, than the greenhouse and all it contained were worth, or certainly more than it would have cost to heat it by ordinary means for a month. How many fine things might be accomplished, were it not for the want of one link in the chain that should bind all together! *Charles Lee, Hammersmith.* [Does it not occur to Mr. Lee what this proves?]——The following extract from the second volume (page 528) of "Professor Ansted's Geology," may interest your readers, as bearing on the employment of heated water to promote vegetation. "Advantage has sometimes been taken of the temperature of water from deep springs, and conservatories have been warmed and even Cress plots cultivated by such means. It is stated that a salad ground near Erfurt, in which this method is adopted of communicating a high and regular temperature, yields a profit of not less than 12,000*l.* per annum to the proprietor. Fish ponds have been sometimes improved by such warm springs being passed through them." I fear that there has been some mistake in rating the profit so high as 12,000*l.*; probably 12,000 francs. But I give the extract in Professor Ansted's own words. *A. C., Edinburgh.*

The Gardeners' Benevolent Institution.—As a gardener and a subscriber to this institution, I would respectfully beg to draw attention to what I would term the slumbering position of it. I much fear that two-thirds of the gardening fraternity in the British Isles either do not know or do not fully appreciate the benefits which might be expected from it, if it could receive an extension of support worthy of its objects. Neither can I imagine that the nobility and gentry of our charitable isle have ever become thoroughly acquainted with its scope and tendency, or they would more numerously subscribe towards the assistance of a body of unfortunates from whom, as a class, they have ever derived no mean share of their comforts, and, I may add, their delights. When it is considered that gardeners are peculiarly a rheumatic class, and that a much earlier disability to continue in service characterises those of later times; and that, principally owing to the extension of plant culture (subjecting them much to humid atmospheres, and to sudden chills), surely there will be found to exist a powerful claim, I will not say on the justice, but on the benevolence of those in affluent circumstances, and who are attached to horticultural pursuits. It is well known that as a class, few are enabled to lay by anything for a rainy day. Gardeners are generally married men; and if they happen to get their "quiver full" of children betimes, adieu to all ideas of independency. I should be sorry to attempt to impugn the zeal of Mr. Cutler, the worthy secretary to the institution; but I should certainly like to hear from him as to whether all possible means have been taken to give the thing publicity in the right quarter. If Mr. C. would make it known in the *Gardeners' Chronicle*, it might serve to warm the subject up again, and perhaps to give a renewed impulse to it. Amongst other modes of bringing the subject before the public, and of keeping it alive, I would suggest that a prospectus of the intentions of the institution be hung in every seed-shop in Great Britain; as also in every exhibition-room through the kingdom; and that nurserymen have circulars which they be invited to circulate; or that they be furnished with wrappers for a portion of their annual or other papers; such as are likely to fall into the hands of the gentry or wealthy amateurs. In addition, perhaps, the conductors of our gardening periodicals would occasionally spare an odd corner in order to tickle the memories of their subscribers, for this in itself would be no small affair. *Robert Errington, Oulton Park.* [If Mr. Errington lived in London he would know that no *legitimate* means are neglected to make this excellent charity known. If it is not so prosperous as it might be, gentlemen are not to blame, so much as gardeners are.]

Mildew on Grapes.—On removing some lateral shoots from my Vines on the 3d of April inst., I discovered that I had got mildew. I sulphured all the parts I could find affected, and left them. The Vines were just coming into flower, and a day or two previous to the appearance of the evil I had kept the atmosphere comparatively dry. Cloudy and cold winds prevailed at the time, and I attributed its progress to being obliged to keep up the temperature by artificial heat coupled with a dry air. Accordingly I have since kept the atmosphere more moist. Wherever the sulphur touches the fungus the latter disappears; but of course it leaves a brown spot on the leaves affected. What I am most anxious about is to know whether or not by perseverance I will be able to keep the evil in check until the berries are ripe. The keeping a rather moist atmosphere will also, perhaps, affect the setting of the fruit. I may add that on the branch on which I first noticed it there was a piece of last year's wood of a dull green colour about 1 or 2 inches long, completely covered with mildew; this was probably the remains of last year's disease which had escaped my observation. My house is heated by hot water, and contains plants usually found in Vineries where there is insufficient house room, such as Camellias, Azaleas, Fuchsias, &c. Spots are still making their appearance. After the leaves have become partially brown from their effects, should I remove them and encourage others to take their places? [Not if you can help it.] *Edgar Sanders, Egham Lodge, April 12.*

Monthly Meteorological Abstract, Pembroke Dock-yard.—

Date.	Thermometer. Absolute Maximum.	Absolute Minimum.	Mean.	Average Maximum.	Average Minimum.	Mean.	Rain in Inches. 8 in. Gauge on Tower, 42 ft. 6 in. from ground; 31 ft. above 5-in. Gauge, 60 ft. 8 in. above high-water level.	5-in. Gauge, 5 ft. from ground; 29 ft. 8 in. above high-water level.	Wet Days.

The 5-in. Gauge is on a slope rising from the Tower.

Rain at Bowness, Windermere, in 1849.—January, 12.133; February, 3.226; March, 1.701; April, 1.946; May, 3.265; June, 1.789; July, 6 138; August, 5.490; September, 3.358; October, 9.286; November, 8.371; December, 4.354. Total, 61.557 inches. *T. S. P.*

Extraordinary Flight of Swallows.—Although a straggler is sometimes to be seen sooner in the month, the usual advent of the swallow, in this part of the country, is from the 12th to the 20th of April. This year my gardener saw one on the 5th, and I have heard of one or two other solitary birds elsewhere. But in the afternoon of the 10th, I had just been enquiring of him whether he had seen more or not, when our notice was attracted to the sudden appearance of a large flight which made a little play over our heads, and then drew together again and went all off to the westward. My man guessed them at 100, and I dare say there were so many. There was a light wind from the east at the time, and it had been blowing from the S. and S. E. for many days before. I do not doubt that these birds had crossed the narrow part of the Channel that morning, and went on to distribute themselves in the southern counties farther west; only one solitary bird having been seen here since that day. Mr. Knox, in his pleasant "Ornithological Rambles" in Sussex, has pointed attention to the outward-bound migration of our wanderers along the south coast towards the narrow part of the Channel; and we see the birds of the swallow tribe congregate and go off in the autumn. But it is not often that they are observed to come in flocks like what I have been describing. Ours always make their appearance, for anything before observed, as stragglers, or a very few at a time. *M., Pulborough, Sussex.*

Rhubarb.—Have any of your readers noticed the increasing prevalence of that "physicky" taste in Rhubarb, which so disagreeably and strongly reminds us of the chemist's shop? If so, can they inform me whether it depends on species, culture, soil, cooking, or any removable cause. My experience is very small, but the same plants in the same garden do appear to me quite different in taste at different times. *L. L.*

Gravel Walks.—Decomposed sandstone is an excellent covering for walks, in order to bind any loose material of which they may be formed. Soon after its application the surface becomes perfectly smooth and almost as firm as a flag. The walks may be swept during wet weather, nearly as well as when it is dry. About three years since I made a walk of the rider or limestone with which lead ore had been blended. I procured it in the state locally termed "cuttings;" that is, after it had passed through the crushing mill, and the ore separated from it. In this state the largest of the pieces will pass through a ring an inch in diameter. The kind I made use of was almost as hard, sharp, and angular as broken flints. Having previously formed out the walk, by lowering it about 8 or 9 inches below the surface—perhaps one-half of the depth would have answered equally well—and without making any provision for drainage at the bottom, the soil being sufficiently porous to allow the water to pass through it, I filled it with the cuttings to about 1 inch from the lawn at the sides, and exactly to the height of the lawn in the middle of the walk, the width of which is 4 ft. 6 in. I then put on the sand just sufficiently thick to cover the angular points of the cuttings. I allowed it to remain in this state for a few weeks, and then put on a second covering of sand. In a short time it became firm and hard, and has remained so ever since. Severe frosts and sudden thaws disturb the surface a little, but it soon regains its previous firmness. If the colour of walks is an object in landscape gardening, much might be accomplished by covering them with sand of proper hue. We can get it here from creamy white through all the intermediate shades of the yellow ochres, to a deep brunt terra de Sienna brown. *Wm. Wallace, Nenthead.*

Tomtits, and other miscalled Vermin.—"Defend me from my friends, and I will take care of my enemies," is a maxim oftener quoted than understood, for it is not always that a man can distinguish friends from foes. A gardener is but a man, and therefore occasionally finds himself in this predicament; as witness the obfuscation of his notions on the supposed atrocities of tomtits and other feathered monsters, with whom he fancies it a point of duty to wage a war of extermination. Bless the man! his own common sense—and a gardener, of all people, ought to have a decent share of this—might teach him better; yet what a want of observation, what a strange jumble of cause and effect is often met with in a class whose daily and hourly experience ought, one would think, to insure very different results. The defence of these supposed garden marauders I might well leave in the hands of such redoubtable champions as Mr. Doubleday and Mr. Bree; but that I deem it but an act of justice to add my testimony to the correctness of their decision. During my abode at Whittington, in Norfolk, I planted and reared a rather extensive flower and kitchen garden; the borders of the former being planted with various ornamental trees and shrubs, which in due time became the resort of blackbirds, thrushes, goldfinches, and I know not what besides. From the beginning I made a resolution, which I rigidly adhered to myself, and as rigidly enforced on all around me, to preserve and encourage these several visitants, whatever might be their number and variety. My litttle demesne was as strictly tabooed as Charles Waterton's Park, and the report of a gun as great a novelty. To one exception I certainly do plead guilty, and that is in the case of the eviction of martins by those most impudent of burglars the sparrows; a race whose peculiar creed seems to be—

"That they should prig who have the power,
And they should keep who can."

By way of set-off to this moral depravity, I am quite willing to accord to them many and great countervailing virtues. They are most laudably voracious; and though this voracity is occasionally exhibited in the seed-bed, or the ripening corn-field, yet their chief sphere of usefulness is unquestionably the garden, as wholesale destroyers of grubs, caterpillars, &c. Like the blackbirds and thrushes, their betters, they plead guilty to the abduction of a certain quantum of fruit; but they allege, and with some show of reason, a sort of prescriptive right to this as their share of the produce. At all events, it rests with the gardener to determine the amount of this share, for nothing is easier in a general way than to protect any given spot, or bush, by covering it with a guard of net-work, either wire or cord. So far, but no farther, do I admit the doctrine of protection; but carried to the extent I have heard of its being attempted by some, viz., to the exclusion of all birds whatever from any particular spot of ground, it must inevitably lead to failure and disappointment. A friend of mine was once witness to such an attempt, and such a failure. It occurred to a neighbour of his, who, having the fear of tomtits and other perils before his eyes, set himself most manfully to circumvent the whole tribe of winged Philistines. He did not indeed "hedge *in* the cuckoo," but he did the next feat to it, he hedged him *out*. In fact, he inclosed and covered in nearly all his garden; and a rare mess he made of it! True, he kept out all the birds, for not so much as a tomtit could penetrate the charmed circle of his *sanctum sanctorum;* but he soon found that even excluding tomtits would not always insure safety to his produce, whether of fruit or flowers; for the various tribe of insecta, with all their ramifications of hymenoptera, and coleoptera, and neuroptera, and lepidoptera, and hemiptera, and diptera, and other opteras and ipteras, with their numerous kith and kin to the third and fourth generations, finding themselves safe from the attacks of the respective ogres who formerly made it their peculiar pastime to pounce upon and gobble them up by wholesale, began to fancy themselves in an El Dorado—a species of insect paradise, which called for the hum of myriads, and all was soon high jinks and jollity. Even snails, and slugs, and earthworms joined to swell the chorus—

"Oh if there's an Elysium upon earth,
It is this—it is this!"

The effects of all this insect gallivanting were soon painfully apparent to the sapient author of the mischief. Not a leaf, nor a bud, nor a fruit but told a tale of disease and death; the very place stank of insect repletion and depletion; and all through the blind and impotent attempt of man to improve upon, and even to counteract the designs of Omnipotence. My own experience of a system the very reverse of this fully satisfied me of the mischief and absurdity of this restrictive policy. The Cabbages and other vegetables in the small gardens attached to the cottages in and about Stoke, I observed year after year, were sure to be destroyed, or at least greatly injured by caterpillars, grubs, and other insects. Why? Because from their proximity to the dwellings no birds dare go near them. The insects had their full swing, and they made the most of such a chance. When any of these cottagers visited my garden, as I always encouraged them to do, their cry was, "How lucky you are with your Cabbages and Cauliflowers, sir! Why, I don't see a caterpillar upon them! Ours are sheer stumps. Never will be good for nothing. How the plague do you manage?" "Manage! by encouraging the birds, instead of scaring them away as you do. The moment a blackbird is seen to pick one of your Cherries, off goes the gun, and you spend us much in powder and shot before the season is over as would cover your tree with old fishing net. Nor is this the worst. You drive away all the small birds, and then come to me with a cock-and-a-bull story of your want of luck in not being able to raise such good Cabbages as your neighbours. You do not deserve as good; and another thing allow me to tell you; you never will have as good till you alter your system of management." In the course of my proceedings I have had more difficulty with cats than with any other enemy of the birds. Boys and gunners I could always manage, but the cats bothered me. True, I might have destroyed them, but then the mice would have got the upper hand. At last I adopted the following device, which completely succeeded in preserving the nests; which, till then, had been frequently pulled down, and their inmates destroyed. I took a piece of 2 inch meshed wire net, square or round, no matter, about 2 or 2½ feet across; this I cut open to the centre so as to

clasp the stem of the tree or shrub. The edges of the cut wire were then brought together and fastened, and the piece rested horizontally on one or more of the side branches of the stem, a foot or two below where there was any likelihood of birds building; forming, when finished, a sort of shelf, resembling the piece of furniture called a dumb waiter. A cat could creep up to this net or shield, but beyond, it was "no go." When fixed it was no more visible than a cobweb, and would last many years. I had no nests disturbed that were so protected. Mr. Bree's allusion to my friend Joseph Paul's opinion of the value of birds in the destruction of insects was both satisfactory and amusing to me. Few people are more at home in the knowledge of the insect world than Mr. Paul. It seems to run in the family. His worthy uncle, the late Robert Paul of Starston, was an enthusiast on the subject, and devoted much time and no little money to the invention of traps and other devices for inveigling the flies and lice which infested his Turnip and Bean crops. Nay, the better to make himself acquainted with their domestic economy and family arrangements, the good man had a sort of private establishment for the board, lodging, and education of certain flies, lice, and wireworms, the better to carry out his preventive schemes. We always met at the Holkham sheep shearings; at one of which (1818) he was introduced by Mr. Coke to Lord Erskine as the inventor of the fly-trap. I happened to be present at the time, and shall not easily forget the sly, quaint, but sarcastic remarks of the ex-chancellor on what he considered the daring, almost impious, attempts of man to thwart, by his puny devices, the designs of the Almighty. "I have also a plan for destroying rats, my lord," observed Mr. Paul, evidently desirous to change the subject. "There, sir," exclaimed his lordship, with great animation, "I should applaud you to the echo; and I hope that you will not confine your exertions to any particular species, but extend them to bipeds as well as quadrupeds." *Samuel Taylor, Earnwood, Gloucester, April* 16.

Societies.

Horticultural, *April* 16.—R. S. Streatfield, Esq., in the chair. C. S. Shaw and C. Fraser, Esqrs., were elected Fellows. Messrs. Veitch received a Large Silver Medal for a new and very fine Clianthus from New Holland, having a greyish aspect, and bearing a cluster of large brilliant crimson flowers. It was named C. formosus; it appeared to be a profuse bloomer, and will no doubt prove a great acquisition. The same nurserymen also produced an example of Dendrobium Farmeri.—From Mrs. Lawrence's garden at Ealing Park came the same kind of pink-spotted fragrant Trichopilia which was exhibited on the 2d inst. by Mr. Loddiges, and which is an improvement on T. tortilis; a good specimen of Mr. Skinner's Cattleya (C. Skinneri), an Oncidium, and a Mormodes, together with finely flowered specimens of Erica nitida, and of the Chinese Enkianthus reticulatus, a plant which few can cultivate successfully. A Certificate of Merit was awarded to the Heath, and a Banksian Medal to the pink-spotted Trichopile, the Oncid, and Mr. Skinner's Cattleya.—Mr. Errington, gr. to Sir P. G. Egerton, Bart., M.P., sent a long, straggling, cut spike of the new Oncidium trilingue with rather handsome brown and yellow curiously-formed flowers; and Mr. Lane, of Great Berkhampstead, an example of Warrea discolor, from Costa Rica.—Mr. Henderson, of St. John's-wood, contributed a poor specimen of the bright yellow blossomed Epimedium colchicum, which, when grown in perfection, is one of the gayest early-flowering hardy plants we have; and along with it Ceanothus papillosus, one of the several sorts recently introduced by the Horticultural Society from California. It is expected that C. dentatus, which proves to be a very fine thing, and most of the others brought over at the same time, will be hardy; but this one (C. papillosus) was stated to be the most tender of them all. It, however, survived last winter with Mr. Henderson, planted out against a *north* wall. A Certificate of Merit was awarded to it and the Epimedium. The same nurseryman produced a deep crimson-flowered Malva (M. umbellata), Chorozema flavum, the white blossomed Anadenia pulchella and three Cinerarias.—Messrs. Fairbairn sent a large bright rose-coloured Azalea, called Dilecta, for which a Certificate of Merit was given, and a similar award was made to Mr. Ayres, of Blackheath, for Pimelea Verschaffeltii, which, if well-flowered, is really a good thing.—Messrs. Henderson, of Pine-apple-place, produced a well cultivated plant of Siphocampylus manettiæflorus, an interesting collection of Cinerarias, another of Hyacinths, and three plants of a small pale blue-flowered New Holland Comesperma, leafless, and comparatively unattractive. A Banksian Medal was given for the Cinerarias and Hyacinths.—Mr. Jones, gr. to Sir J. Guest, sent three Ripley Queen Pine-apples, the heaviest of which weighed 4 lbs. 2 oz.; the other two were lighter and not quite ripe. A Certificate of Merit was awarded for the first-named fruit.—Messrs. Hartley exhibited samples of their patent rolled plate glass, a very different article from common rough plate; Mr. Dobree, of Guernsey, a plaster of Paris model of a Chaumontel Pear, which weighed 2 lbs. 4½ oz., and Mrs. Temple, examples of wax flowers.—The Garden of the Society furnished three kinds of Oncids, Trichopilia tortilis, Hypocalymna robusta, Fernandezia elegans, Acacia decipiens, two Azaleas, the double white-flowered Chinese Peach, Genista racemosa, Dillwynia speciosa, Pultenæa stricta, Henfreya scandens, Diosma capitata, the Apricot-flowered Alloplectus speciosus, and the old-fashioned Theophrasta Jussiæi. — It was announced that printed copies of the audited accounts of the Society were ready for delivery to Fellows, and that April the 23d was the last day on which tickets would be issued at 3*s*. 6*d*. each.

Linnean, *April* 16.—The President in the chair. A continuation of Mr. Miers' paper on the natural order Triuridaceæ, was read. After describing the remaining species belonging to the order, the author made some remarks on its affinities. One remarkable point in the structure of the order was the absence of a true embryo in the seeds. After criticising the labours of Brown, Griffiths, and Lindley, on the Rafflesiaceæ and Balanophoreæ, the author was disposed to agree with the two first observers in thinking that these orders should not be separated from the class of dicotyledonous plants. He dwelt on the want of a perfect embryo in such orders as Cuscutaceæ, Orobanchaceæ, and Pistiaceæ, as a proof that a want of development of parts of the embryo was not sufficient ground for constituting a distinct class. On these grounds he was disposed to regard Triuridaceæ as an order of Endogenous plants, near Alismaceæ, Juncagineæ, and Fluviales. He proposed to call the imperfect embryo of this and other families a *protoblastus*. At the conclusion of the paper, the President remarked that for our knowledge of this order we were more indebted to Mr. Miers than any other botanist. He did not quite agree with Mr. Miers as to the affinities of the order, or his nomenclature of certain parts of the structures he had so well described. Mr. Marnock exhibited a remarkable specimen of the woody growth of Viscum album.

Microscopical, *April* 17.—Dr. A. Farre in the chair. The following gentlemen were elected members: Captain Manners, Captain Trotter, J. B. Mummery, Esq., R. Meslayer Esq., H. Cantis Esq., F. H. Wenham Esq., C. White, Esq.—Mr. Warren De la Rue made some observations on a previous paper by Mr. Shadbolt, on the construction of a prism for using oblique light with the microscope. A paper was read from Mr. F. Wenham, on the construction of an apparatus for the better illuminating opaque objects under the microscope. The President called the attention of the members to the state of the cabinet, and requested contributions from the members. He also exhibited a microscope of French construction, with three sets of glasses, the highest power being 270 diameters, which cost 70 francs. He expressed a wish that our English makers would furnish cheaper instruments, as he believed it would lead to a more extensive use of the microscope, and in the end to the sale of the more expensive kinds. Mr. Bowerbank, Dr. Lankester, and Dr. Carpenter advocated the construction of cheaper instruments than could be at present obtained of the best makers. Mr. White stated that it would be impossible to make the admirable object-glasses of the great English makers at a low price. Dr. Lankester stated that Mr. Beck would exhibit some young trout which had been produced according to the plan proposed by Mr. Boccius. He thought it would be interesting to the Society to know that in the hands of Mr. Gurney the plan had perfectly succeeded, and that he now possessed a brood of promising second year's trout.

Royal South London Floricultural, *April* 17.—This exhibition, the first of the season, was held at the Horns Tavern, Kennington. The day being fine a large number of well cultivated stove and greenhouse plants was produced, and, as a florists' show, it was creditable, though not so fine as we have seen it.

Best 24 Pansies: Nurserymen—1st prize to Mr. Turner, Royal Nursery, Slough, for Bell's Duke of Norfolk and Climax, Youell's Supreme and Androcles; Thomson's Constellation, Polyphemus, Duchess of Rutland, and Cyclops; Turner's Mr. Beck, Miss Edwards, and Addison; Hooper's Wonderful and Juventa; Mrs. Hamilton, Bellona, Queen of England, Ophir, Hector, Lucy Neal, Rubens, Milton, Aurora, Rainbow, and Gem; equal second prizes to Mr. Thomson, Iver, and Mr. Bragg, Slough. Mr. Thomson had a fine yellow-ground flower, Lord Walshingham, Penelope (white ground), Caroline, California, Andromache, and Miss Thomson, the remainder being a repetition of the first stand. In Mr. Bragg's stand we observed a good dark variety of Joseph Hunt. The following flowers were shown in good condition: Helen, Sir R. Peel, Mrs. Beck, Leader, and Model of Perfection. Best 24 Pansies: Amateurs—1st prize to J. Edwards, Esq., Holloway, for Privateer, Ophir, Rainbow, Miss Edwards, Constellation, Mrs. Hamilton, Queen of England, Wonderful, Climax, Addison, Lucy Neal, Zabdi, Hector, Charmer, Masterpiece, Model of Perfection, Duke of Norfolk, Juventa, Royal Standard, Mrs. Bragg, Helen, Gem, Aurora, and Disraeli; 2, Mr. J. Scotcher for Miss Edwards (Turner's), fine; 3, Mr. Over, for Helen (Hunt's), ditto; 4, Mr. Parsons, for Rainbow (Thomson), ditto. Two first-class Certificates were awarded for seedlings, both yellow-ground varieties, contributed by Mr. Turner—Mr. Beck and Rubens—both smooth fine large flowers. The Pansies were large and fresh for the time of year.

Best pair of Auriculas: Amateurs—1st prize to W. S. Ginger, Esq., for Champion (Page), and Duke of Wellington (Dickson); 2, Mr. W. E. Miller, for the same varieties; 3, W. Sandilands, Esq., for Duke of Wellington and Glory. Best four: Amateurs — 1st prize to W. S. Ginger, Esq., for Alexander (Stretch), Britannia (Hodge), Duke of Wellington (Dickson), and Champion (Page), very fine plants, surpassing any four we have seen for years; 2, Mr. W. E. Miller; 3, J. Chapman, Esq.—In the Nurserymen's class Mr. Dickson showed four good plants, but not equal to this grower's general productions.

Some Polyanthuses and Cinerarias were shown in good condition. Among Seedling Cinerarias, of 1851, Clementine (white, tipped with purplish crimson, and dark disc) received a first-class Certificate and an extra prize. This was shown by Mr. Salter; and Mr. Kendal received Certificates for Black-eyed Susan (white, tipped with purplish crimson, and dark disc), Eclipse (white, tipped with purplish blue, and dark disc), and Dr. Bushell (white, tipped with amethyst, and dark disc). These are all promising flowers, which we should like to see again.

Messrs. Jackson, of Kingston, showed a nice bloom of their new light Camellia, named Countess of Ellesmere; a fine white Rhododendron, which is stated to be quite hardy; the true R. arboreum (deep crimson), and a variety of Smithii (rosy purple).

April 10.—Meeting at Worton Cottage for the display and examination of seedling florist flowers and other productions.—On this occasion there was present, for the purpose of comparison, a very fine tray of Pansies (old varieties) from Mr. Bragg, of Slough; blooms of the same from Mr. Turner, and a few of the finest varieties of Cinerarias in cultivation. Some seedlings of the latter, from a raiser in Bedfordshire, although very pretty, were inferior to the former in many respects. We suspect from the presence of green-fly on the flowers, that the plants were not in the best condition, and consequently the flowers were smaller than they should be. "L. L." sent some striking Pansies; one of them, No. 21, had a yellow ground, dark purple belting, top petals same shade, flat, excellent shape, full size, and in every respect a good show flower; the others, though fine in many particulars, will not do. Several seedling Pansies were produced, but nothing requiring notice at present; they must all be seen again. Mr. Willison, of Whitby, sent two seedling Roses, one of which had fallen to pieces; the other was a most fragrant variety in a half open state; it seemed a promising thing, and should be seen some time hence, when the powers of comparison with its predecessors will enable us to form a correct judgment upon its merits.

April 17. — Very few things present, it being the meeting of the South London Floricultural Society. There were a seedling Azalea, and some seedling Cinerarias and Pansies, all very pretty, but not sufficiently striking to call for particular notice. We could see that next week some two-years old seedling Pelargoniums would be present, as Mr. Beck's collection is fast coming into bloom.

Review.

Adult Schools. A Letter to the Lord Bishop of Norwich on the Establishment of Adult Schools in Agricultural Districts. By A Country Curate. London: Longmans.

This is an unpretending pamphlet worth reading. The Curate's purpose is to show that education should not cease when a boy is sent to work, but that it should be continued in the full-grown man. In this we entirely agree with him. All you can teach country *boys* is routine; but upon the minds of country *men* you may impress principles—very imperfectly perhaps—but still you may make an impression. Or if you cannot, you may give him something profitable and pleasant wherewith to occupy his leisure—and even country labourers have some leisure, however small—nay, a good deal—or they would not waste so much time in the pot-house.

We entirely disbelieve in the existence of an innate desire to swill beer, and to reel home like a drunken sot—such consequences attend upon the having nothing to do, except to labour hard, which man's *physique* is unequal to. Our Curate then deserves all the encouragement which the press, at least, can give him, in his laudable attempt to establish adult schools. But he deserves much more from his neighbours, for his attempts have been crowned with success. Upon that point we quote his words, although long; for no amount of space can be mis-bestowed in a case like this.

"The author of these pages entered upon the curacy of two parishes in this diocese in October. Though for the education of the rising generation of the poor of both parishes ample provision has been made for some years past, the older inhabitants, as in most parts of this diocese, are lamentably ignorant. To remedy this, adult evening schools, meeting three times a week, were established in both parishes, the management of which was confided to the author. They met for the first time on the 3d and 4th of December. At parish A, the number on the first night was 11; at parish B, 10. After the third week the numbers greatly increased, and the average attendance for some time has been nearly 27 at parish A, and nearly 40 at parish B. The extent of knowledge at these schools is of a most elementary nature. At parish A, not more than three or four can read with fluency. At B, the first class, containing 14 or 15, read fairly; the second class, imperfectly; and some in the third class cannot read at all. Writing and arithmetic are in the same elementary state.

"But a gratifying feature presents itself, in the high promise which these schools afford. The payments, for which no credit is allowed, are willingly made; the the desire to improve is most eager; and the advancement is most rapid. Men who could not read a word, can now read and spell; some who had never formed a letter can now write neatly on paper. In the first class at parish B, men who could read on after a fashion, but not spell, nor bear to be questioned, can now spell well, and answer questions arising from the subject, readily and with gusto. They are, indeed, most eager to obtain knowledge, and in most cases they endeavour on off nights to improve themselves at home. The interest too, comparatively unfelt before, which they take in the progress of their children or relations at the National Schools, is most pleasing and valuable. I might here state my firm conviction, that had the study of vocal music been introduced (which a local circumstance

forbad) the numbers would have been far greater. As it is, I have good reason for expecting that the following winter will witness a more numerous attendance, even without such a popular inducement.

"At parish B, almost all of those who are not necessarily engaged, meet between services on the Sunday: though no one is then present but themselves, they are most orderly and assiduous under the conduct of the monitors. They afterwards proceed to church. Attendance on the Sunday is quite optional. The following is an analysis of the ages of the adults at parish B:—1 above 40, 8 above 30, 4 above 25, 11 above 20, and 15 above 16. But how is all this acting towards improving the physical condition of the labouring classes?

"At the same time were commenced a Horticultural Society for the encouragement of cottage gardening, and also a lending library. Both of these now bid fair to prosper. Many of the adults are already members of the lending library, and many more will join when their acquirements will warrant the step. Thus sound instruction and rational amusement are provided at their own homes. Arithmetical knowledge is also conveyed, with the definitive object of advancing the economical disbursement of limited means.

"Above all, that curse of the agricultural districts, the club, will now be gradually abolished by means of these schools. One sound Friendly Society will soon rise up out of the ruins of various public-house clubs, which are established one year to break up and divide assets the next; then to start afresh to be broken up again."

We only regret that the author's name is unknown; for we should hope that some charitable purses would be opened to aid him if it were certain that the contents would reach their destination.

Garden Memoranda.

Elm Grove, Roehampton, the seat of J. H. Oughton, Esq.—The mansion, a classic Roman villa, with a handsome entrance porch in front, is placed at the northern extremity of an extensive and beautiful lawn, that slopes gently to a fine piece of ornamental water which bounds it on the south. Large Elm trees, with stems buried in Ivy and issuing from among evergreens, surround the house and either side of the lawn, which is divided into two parts by a hollow gravel walk, margined with flower beds and standard Roses. The part between the hollow walk and the water is tastefully laid out in flower beds, here and there interspersed with ornamental trees and shrubs; while that next the house is open glade, dotted at the lower end with nice bushes of Portugal Laurel and Laurustinus, and bounded on all sides by semicircularly hollowed ha-has and broad gravel walks. At a corner of the lower lawn is a neat little Rosery, furnished with choice standard plants in 4 feet beds, which form concentric circles, with 4 feet gravel walks, all surrounding an ornamental vase in the centre, and which is approached on two sides by a gravel walk. In summer, when the Roses are in bloom, together with the herbaceous plants which carpet the ground below them, this forms one of the most interesting spots in the whole garden. Leaving the lawn by a tunnel through below the public road, and following a broad circuitous walk among evergreens for a short distance, we enter the kitchen garden at the north side, in full view of the extensive ranges of glass houses at the opposite or south side. This, like most kitchen gardens, is a parallelogram, enclosing two acres within the walls. The latter are covered with beautiful fruit trees, which promise abundant crops, as do also the "dwarfs" in the borders. These "dwarfs" are pruned in closely every year, after the manner in which such trees are managed in the Horticultural Society's garden, and under this treatment they succeed uncommonly well, and are kept within small bounds. In the east corner, against the south wall, is the Geranium-house, 26 feet long, 17 feet wide, and 10 feet high, which is all the house room Mr. Parker requires to grow the plants in, which he every year produces at our great metropolitan flower shows, and which are the admiration of every one. The top shelf contains the specimens which are to blossom in May, and the lower shelves those for the succeeding months. Some of the May plants, among which we remarked Arabella, Forget-me-not, Negress, Resplendent, &c., were already coming into bloom. Each plant exhibited perfect symmetry of growth, and was not at all "drawn." Even those on the lower shelf, although 7 feet from the roof, were just as free from etiolation as those near the glass. On shelves round the front were some finely grown Cape Pelargoniums, which Mr. Parker is in hopes he will by-and-bye be able to produce in as good condition as the florists' kinds; elegans, glaucum, reniforme, flexuosum, ardens, elatum, and others, were in flower. The principal range of glass against the south wall is 160 feet long, 25 feet wide, and 14 feet high. It is divided into two Vineries, that annually bear heavy crops, and a greenhouse filled with Oranges, Camellias, Azaleas, Geraniums, Callas, in full bloom; Heaths, &c. In front of this range, and divided from it by a border and a broad gravel walk, is a third Vinery, which is 50 feet long, 12 feet wide, and 10 feet high at the back. The Vines in this pit, for so it may be called, were just going out of flower; the crop promised to be abundant, as it always is. In a line with this Vinery is a Peach pit of similar dimensions, well furnished with healthy trees, literally loaded with fruit, done stoning. It is in this pit that Mr. Parker produces the excellent Peaches and Nectarines with which he is usually so successful at the early shows. The Melon ground lies at the west end of the glass houses, and rather behind them. It comprises a considerable extent of framing. Cucumbers and Melons, Radishes, and early Carrots (the latter two covered at night with wooden shutters), and Potatoes, are all grown, or rather forced here. The Potatoes (Early Royals) were from 6 to 8 inches high, and to all appearance very healthy. They were planted out in soil on a bed of leaves and dung hooped over and covered with mats and litter at night, but left open in fine days. They were transferred to this bed in the last week in February from small pots, in which they were started under glass. In front of the Melon ground, and running up the west side of the garden, is an orchard, 3 acres in extent, well stocked with fruit trees. The soil of the kitchen garden is a dark coloured friable loam on clay, and very productive. The outsides of the walls are clothed with fruit trees, and the borders in which they grow are found very useful for many purposes.

As Mr. Parker is universally admitted to be one of the best growers of Geraniums in the kingdom, perhaps the following account of the way in which he manages his exhibition plants may not prove uninteresting. To begin—He strikes his cuttings, which are obtained as soon as the wood is thoroughly ripe, under hand-glasses in the open ground, watering them very slightly for a week or two, but exposing them to dews at night. When they are well rooted, they are lifted and potted in turfy loam, two-year-old cow-dung, some peat and silver sand, all well mixed together, and placed on an efficient drainage. The plants are then set in a cold frame, and kept close in the day-time till they have become established; but they are left open at night. Ultimately the lights are off during both day and night, and, as soon as they will bear it, they are placed on boards, exposed to all weathers, until the long, cold, late autumn nights cause them to be placed in-doors. The main point in their out-door treatment is, never to allow them to get water-logged or stunted in their growth. They receive a shift in November, using the compost mentioned above without the peat. They are again shifted in February, and each shoot stopped at the fourth joint. Lateral shoots are then produced, and these are tied out horizontally, so as to form the basis of the future specimen. The lateral shoots are also stopped, and by these means plenty of wood is obtained for large plants in the following season. But Mr. Parker has another mode of proceeding, which is, to take strong plants in April or May, pot them in 11-inch pots, place them out of doors, and pick the flowers off them throughout the season. Next year they are fit for exhibition. The plants that are to blossom in May are never stopped after they are cut down in July. The June plants are stopped early in January, and those for July in February. To grow Geraniums successfully, Mr. Parker finds that much depends on their winter treatment. They should not receive too much water or fire-heat, and the wood should be well ripened before they are allowed to flower, if a fine head of bloom is wanted. Mr. Parker's general time for cutting down is between the first week of July and the middle of August, according to the ripeness of the wood. When the plants have fairly broken, the old soil is shaken clean from their roots; the latter are trimmed in a little, and the plants are repotted and placed in a frame till they have become established, when they are placed out of doors till they are removed to their winter quarters. To come in for exhibition in May and June, they are repotted in November, and for July in February. When they begin to show flower-buds, liquid manure is occasionally given them. The latter is made by putting into a large tub of soft water half a barrow-load each of cow, sheep, and horse-dung, and a peck of lime, mixing well and using the clear liquid, after two-thirds of clean water has been added to it. During the blooming season plenty of water (not liquid-manure, that is only given five or six times just before they come into flower) is required, otherwise the foliage becomes discoloured, and the blossoms come small and deformed.

The above contains the leading points of Mr. Parker's system of managing Pelargoniums. We have only to add, that everything about the place exhibited the best of keeping, the soft, velvety lawn, with its sloping banks, was closely shaven, the walks nicely rolled, all the shrubs (and they are many) annually examined and cleared of discoloured leaves and dead wood, and altogether this is one of the most charming villas in the neighbourhood of London.

Miscellaneous.

Death of Professor Kunth.—The foreign papers announce the decease of this learned botanist, at Berlin, on the 22d of March. He was well known as the colleague of Baron Humboldt and M. Bonpland in the preparation of the great work on the new plants discovered by them in equinoctial America; and, latterly, for a useful Enumeration of all known plants, of which, however, only a few volumes have appeared.

Professorship of Culture in the Garden of Plants at Paris.—We also learn, and with very great satisfaction, that M. Decaisne has been recommended as the successor, in this important chair, of M. de Mirbel, who has resigned in consequence of age and illness.

The Howden Testimonial.—The friends of Mr. W. Howden (late foreman in Inverleith Nursery, but now disabled by age and infirm health), entertained him to supper in Edinburgh, on the 9th inst. Mr. C. Alexander occupied the chair. After the usual toasts the chairman, in a very feeling manner, proposed the toast of the evening—Mr. Howden's health—which was drunk with great cordiality by every one present. He congratulated Mr. Howden and the committee on the warm response with which the appeal to his numerous friends had met, and it gave him great pleasure to hand to Mr. Howden a purse containing the amount of subscriptions, being about 35*l.* Mr. Howden expressed his deep sense of the esteem of his friends who thus testified their friendship in so substantial a manner in the time of need. The meeting was chiefly composed of the most intelligent practical gardeners, and passed off with the greatest harmony.

Sale of Orchids.—A collection made by Mr. Warczewiz in Veragua and other parts of South America, was sold by Mr. Stevens, on Thursday last, at the following prices:—Cattleya Skinneri, from Costa Rica, 3*l.* 3*s.*; a Trichopilia, from Cordillera of Veragua, 2*l.* 8*s.*; Warrea discolor, from Cartago Volcan, 3000 or 4000 feet above the level of the sea, 1*l.* 1*s.*; Ditto, 9000 feet above the level of the sea, 2*l.*; a new Cattleya near C. maxima, from David in Veragua, 6*l.* 15*s.*; a new Trichopilia (just flowered in Mr. Holford's garden in Hertfordshire), 2*l.* 4*s.*; Cypripedium caudatum, 5*l.* 5*s.*; Trichopilia coccinea, 2*l.* 4*s.*; a Sobralia said to be new, 3*l.* 5*s.*; S. labiata, 4*l.* 4*s.*; a new Chysis, 4*l.* 10*s.*; a good specimen of Lælia superbiens, 9*l.*; Barkeria spectabilis, 3*l.* 3*s.*; Lycaste cruenta, 4*l.*; L. Skinneri, 2*l.* 6*s.* Other lots, of which there were in all 200, fetched from 10*s.* to 1*l.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Stoves.—The increased amount of heat and moisture in these structures, aided by longer days and more powerful sunlight, is of course inducing a development of new growth, and it is the province of the gardener to take care that this should be so directed as to make each individual plant approximate as nearly as possible to a perfect specimen. To this end they should be carefully and constantly watched, as every piece of neglect or mismanagement, however trifling in itself, tends in a proportionate degree to defeat the object in view. To lay down more than general principles is impossible; but it is necessary to urge three things upon every cultivator of plants; these are observation, reflection, and action—indispensable at all times, but at no season more so than at the present. Premising that the plants have been carefully potted in suitable soils, the next important point is situation, the temperature of which should of course be in proportion to that of the localities to which the plants are indigenous. Theory points out the advantage of a moderate bottom-heat, as the earth is invariably some degrees warmer than the atmosphere; practice proves this, and proves also that an excess of heat is as injurious to the roots as to the tops. Ample space for every plant is indispensable, as it is impossible, if the plants are at all crowded, to make handsome specimens of them, however well they may be attended to in other respects. After securing the largest possible amount of light, as much heat and moisture may be supplied as the plants will bear without producing weak or spindling growth; taking this as the criterion, any individual plant which seems to require a warmer or cooler, a moister or drier situation, should be accommodated accordingly. Plants of shrubby habit will require, besides the general direction of the shoots, the occasional stopping of any young growths which are unduly taking the lead; and climbers on trellises will require daily attention, to prevent their twining about the wires, and reaching the top of the trellis before the bottom is properly furnished. On the other hand it is not a good plan to keep the tender young growths tied in to their extreme points, as the practice has the effect of crippling them and preventing their progress; and the plants, especially of delicate species, soon acquire a stunted appearance. We prefer allowing the shoots of strong growing kinds to keep from 12 to 18 inches in advance of the tied-in portion, taking care, however, to prevent entanglement. Mealy bug, scale, and other insects which torment stove plants, increase with frightful rapidity at this season, and it is necessary to make great exertions to keep them even in check.

FORCING DEPARTMENT.

Pineries.—As all the plants should now be making rapid progress, a steady heat is very essential, especially among fruiting plants. Where the bottom-heat is supplied by fermenting material it should be carefully examined, and on the first indications of a decline the old tan should be loosened up and surfaced with a few inches of fresh. As the sun will now be a powerful auxiliary in keeping up the heat, it will not so frequently be necessary to renew the entire bed; but if the latter course seems likely to be required soon, it will be well to do so the first time any of the plants are removed for potting or other purposes, that they may be disturbed as little as possible during the summer. As the sun increases in power it will be necessary to shade during clear sunshine with thin bunting; but let this be used very cautiously at present. Vineries.—In the early houses, when the fruit is fully ripe, let the temperature fall to 55° by night, and give plenty of air during the day. Endeavour to keep the foliage green and healthy as long as possible; if proper attention has been paid to preventing the establishment of insects on the Vines, this will be an easy matter, and the additional strength thus secured to the future crop will be an ample recompense for any extra exertion. Peach-houses.—

The Peaches started early in November will now be approaching maturity, and will consequently require more air and less moisture, but in all cases avoid sudden changes. Let the young growths be tied neatly in, but do not allow them to crowd one another. The aim should be to retain no more shoots than will be required at the winter training, otherwise a crowded and sickly foliage will be the consequence. CHERRIES AND APRICOTS. — Let these be frequently examined, and caterpillars or other plagues carefully destroyed.

FLOWER GARDEN AND SHRUBBERIES.

As the bedding out season is so near at hand, we again call attention to the hardening of the young stock of plants. If young plants, which were potted in small pots early in the spring, cannot be temporarily planted in frames of soil, it will be an advantage to give them an occasional watering with liquid manure or guano-water, to keep them in a healthy state till the season will admit of their being planted in the open ground. If they are permitted to become stunted in their growth, it is not easy to induce many of the kinds to start again, especially if much dry weather occurs at planting out time, but the future occupants of these beds will be much benefited if the interim be employed in turning the soil over again and exposing a new surface to the influence of sun and air. In moderately warm localities, Chrysanthemums are very ornamental as late autumn flowering plants, if planted now against a south wall. Half hardy annuals sown in frames, &c., should be pricked out at greater distances apart, that they may be strengthened a little before they are removed to the flower beds. The sowing of hardy annuals, unless already done, should be immediately attended to, if they are required for early flowering; it is a good plan to sow a few patches of those kinds which come quickly to maturity, once in three weeks to the end of June, by which a succession of gaiety will be produced throughout the summer and autumn.

FLORISTS' FLOWERS.

AURICULAS.—Water liberally when they require it; many of the trusses will now be expanding their flowers. The careful florist will look over his collection, and with a small pair of very sharp-pointed scissors cut out those of the centre buds of the truss which crowd the others too much: by judicious thinning, those which are retained improve in size, independent of a simultaneous expansion. Small hand-glasses should be placed over the trusses; the usual way is to have three small forked sticks round the pot, and on these the glasses are placed, by this means there is a much better chance of preserving them from dust and insects. CARNATIONS AND PICOTEES ought to have been potted off early in this month, for much depends on the plants being well established; nevertheless, we have heard of many applicants during the past week, but we warn amateurs against this procrastination. We would advise the sticks to be placed in the pots immediately; for when deferred to a later period the fibres are often seriously injured by their insertion. DAHLIAS.—Continue to strike cuttings of all valuable varieties; those which are already potted off should be kept thriving. RANUNCULUSES.—The weather hitherto has been admirable for these flowers; should the weather set in dry, care must be taken that all cracks on the bed are filled up.

KITCHEN GARDEN.

Crops which have been some time on the ground, and especially those amongst which the soil has been much trodden in gathering the produce, as Parsley, Spinach, &c., and the various spring sown crops as they appear above ground, should have the soil about them loosened with a fork, to allow their roots to penetrate more easily, and at the same time to admit the sun and air more freely. The same operation destroys the young seed weeds which spring up abundantly at this season. After the young plants have gained a little strength they should be thinned if necessary, weeding the rows with the hand. At this period of their growth they should be carefully guarded against the ravages of snails or other insects, which are particularly liable to trouble them in their young and tender state. Proceed with the formation and manuring of Celery trenches as soon as possible, and complete all such work which is liable to make much mess upon the walks, that the latter may be put in respectable order. Sow Celery on a warm border for late crop, and prick out into frames the young plants of earlier sowings. Make a sowing of dwarf French Beans in a cool frame, to be transplanted into the open air as soon as the weather will permit. Sow Vegetable Marrows and Gourds in 4-inch pots, two seeds in each, and place them in a warm frame. Another sowing should now be made of Cauliflower, Broccoli, Borecole, Cabbages, and Savoys, and dust some quicklime over the young plants of former sowings, to preserve them from slugs. Encourage the growth of Tomatoes in a warm frame, and repot them as soon as they require it, to obtain strong forward plants for turning out as soon as the season will permit. Our short summers render it necessary to be very early with these plants; and this is particularly felt in late cold localities. Where the quantity required is considerable, and the spare spaces upon the wall very limited, a quantity may be grown in 10 or 12-inch pots, taking care that the soil be sufficiently rich to compensate for the restriction in point of quantity. When the season is far enough advanced to admit of the plants being exposed to the open air, they may be placed along a walk-side near a wall, or in any other warm part of the garden. We adopted this plan last year with great success. Repot Capsicums, but do not allow them to flower till they are strong and well established. Prick out Basil, Savory, &c., from the seed pans into boxes or frames, preparatory to their being planted out next month.

HARDY FRUIT GARDEN.

Continue to thin gradually the covering of Spruce and Yew branches on wall trees, where the fruit is set. This operation is the more necessary with branches of the Yew, as the leaves continue on them much longer than upon those of the Spruce. Commence the disbudding of Peaches and Nectarines, by removing the foreright and back buds now; but defer the final arrangement for ten days or a fortnight longer. After the blossoms are fairly set, advantage should be taken of a fine morning to wash the trees with the engine, for the double purpose of removing decayed blossoms and destroying the green fly. Be careful not to get the trees too thick of wood. If they are plentifully furnished with blossoms, thin out some of last year's shoots wherever there is a superabundance of them; taking care to remove side shoots only of last year's production, and in cutting them, to leave the lowest bud on each, to produce a new shoot. In this manner young wood can be obtained in parts of the tree which would be otherwise barren. Let particular attention be paid to hand-picking, and destroying caterpillars.

State of the Weather near London, for the ensuing week ending April 18, 1850, as observed at the Horticultural Garden, Chiswick.

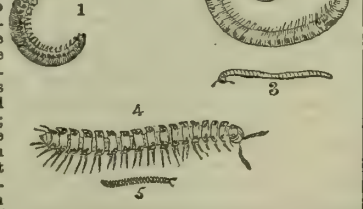
The highest temperature during the above period occurred on the 25th 1840—therm. 80 deg.; and the lowest on the 25th, 1827—therm. 25 deg.



Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

BEE HIVES: *A.* Next week. *Y.*

BOOKS: *C Smith.* All Mrs. Loudon's are useful; that is as much as we can say in the present case. We presume it is the figures and names you want. In that respect it will probably answer your purpose.—*G Gw.* We can only repeat what we have often said before, that if you wish to study botany you *must* begin with the beginning. Master "School Botany" in the first place.—*R S F.* Earp's "New Zealand Hand-book" is a 2*s.* 6*d.* book; it may be obtained of any respectable bookseller.‡

INSECTS: *A Young Beginner.* The person who allowed your plants to come to such a pass ought to be kept scrub, scrub, scrubbing them for the rest of his days—the dirty fellow! It is almost impossible to subdue the vermin; the best way would be to burn the worst plants, to prune close the remainder, burning the branches; to repot everything in clean mould, burning the old mould, to soak the pots in boiling water, to whitewash the house, and repaint all the woodwork. Electricity! You might as well try mesmerism, or put your plants into the hands of a fortune-teller.—*An Islander.* The shell slugs are by no means common. There are four species, one of which (Testacellus scutulum?) is, however, common in the island of Guernsey. (See Loudon's "Magazine of Natural History," vol. vii., p. 224, for a good monograph of the group.) Any further particulars of habits and locality are desirable. *W.*—*D P A.* Your Ash tree has been destroyed by the small stag beetle (Sinodendron cylindricum). We should be very much obliged to you for some specimens of the larvæ, sent so as not to be injured, as well as for a small portion of the wood or bark showing the burrows. *W.*—*E P.* The beautiful globular excrescences on the Oak shoots are galls formed by the puncture of a small four-winged fly (Cynips quercus terminalis). They are not injurious to the trees, except where exceedingly numerous. *W.*—*C J P.* The small white worms sent, and described as attacking the Asparagus, are two species of millipedes, Julus (Polydesmus) complanatus, figs. 4 and 5 in the accompanying woodcut, and Julus pulchellus, figs. 2 and 3; the larger figures representing the insects magnified. They have no doubt been imported with the manure. We should think repeated dressings of salt would dislodge them; if not, make some holes in the bed and put in decaying vegetables, which should be examined from time to time, and the insects (which will congregate there) be destroyed. The larger grub is that of the common daddy-long-legs. *W.*—*W F.* The beetles are the destructive red-legged weevil (Otiorhynchus tenebricosus). If left undisturbed they will gnaw the roots and young fibres of the Filberts. Continue, therefore, to employ the women to pick them. *W.*

CISTERNS: *X Z.* Do not use zinc for cisterns in which water is to be collected for garden purposes. Lead is better, or bricks and cement. Slate is best.

DEODARS: *G P.* We see nothing the matter. The leaves are brown, probably from snow having laid upon them, but they are already falling off, and will be succeeded by others.

DISEASES: *G R.* The leaves of Eranthemum pulchellum are infested with a curious Sphæronema, to which we shall have occasion shortly to advert more fully. Meanwhile will you examine other plants in your conservatory, and observe whether any other genera are similarly infested? By so doing you will have a far better chance of suggesting a remedy than we can possibly have from the mere inspection of a diseased leaf. Should you find other plants affected, would you be so kind as to forward specimens.

FUNEREAL CYPRESS: *A Sub.* Any nurseryman in the kingdom can supply you with it. It has been advertised repeatedly by Messrs. Standish and Co., of Bagshot. It is perfectly hardy, and will grow well at Norwood.

GRAPES: *A B.* Your border is too cold for the temperature at which you keep the house at night. Your night temperature is 20° too high under any circumstances. If your border was warm it would not so much signify, but still your practice would be wrong.—*John Morris.* Spent raisins will not serve as a substitute for tan. If they are rotted down along with bones and common loamy soil, they will form a compost which may be useful in time, but not till they are quite rotten.

GUANO: *H G.* See last week's Number, p. 231, col. *a.* ‡

HEATING: *J R F.* In all the forms of apparatus for hot water the upper pipe is the flow pipe and the lower pipe is the return. We can assure you that such is the case.

MANDRAKES: *T M G.* The best thing to do with them is to plant them at the foot of a south wall, where the soil is *thoroughly* drained, or, if you prefer it, in the south face of some rockwork. Wet at the roots in winter injures them. They should be covered by a hand-glass from October to May; in the other months they should be uncovered. Thus treated they will grow well and flower freely; but we have never been able to get them to set their fruit. They flower very early, and probably want bees, or to be set artificially. Give your Crocuses all the air and light you can till their leaves die; then leave them quiet in the dry ground, and put them into an open dry border in August. They are quite hardy. Scarlet Tulips may be treated in the same way exactly, only they are much more impatient of wet when at rest. Mere cold will not hurt them.

MARKET GARDENS: *Novice.* We strongly advise the young man, with but little knowledge of the business, who has taken about 7 acres of market garden ground, seven miles from London, and who wants instruction in the management of it, to get rid of it again. Such gardening cannot be taught by books. If he is determined to risk the loss of his capital, then his only resource is to hire a clever foreman, well acquainted with the business.

MULBERRY: *L L.* As this tree does not bleed, you may prune it now; but the more you prune it the less fruit will you have.

NAMES OF PLANTS: *M.* Montia fontana.—*Emily.* Begonia Dregei, and one of the hybrids between Cereus flagelliformis and speciosissimus.—*J H.* 1, not recognised; 2, some Bæobotrys, either argentea or macrophylla; 3, Dodonæa angustissima; 4, Bryobium pubescens; 5, Genista racemosa; 6, Acacia biflora; 7, Dendrobium revolutum.—*D P A.* Tussilago Farfara. Make yourself master of Lindley's "School Botany," and then buy Babington's "Manual." When a real difficulty occurs apply to us.—*J D.* Some common Thalictrum, quite indeterminable from such fragments.—*X Y S.* We do not recognise it, in the absence of flower and fruit. It may be some Sapindus.—*Enquirer.* 1, Cyrtomium falcatum; 2, Blechnum Corcovadense; 3, Pteris serrulata; 4, Pteris umbrosa. *S.*—*M B.* Alaternus, Phillyrea, Ruscus aculeatus, Sweet Bay. Very great rarities!

NATAL: *E G A.* Porter's "Tropical Agriculturist," and several excellent practical Leading Articles in our columns during the two last years. But we do not recommend you to go to Natal. You may get on, but it will be hard work. As to Cotton there—where is it? Report says "nowhere."

POLYANTHUSES: *H.* Next week.*

PRUNING VINES: *J L.* As your unpruned Vines are but just breaking their buds, you must not cut them at present. When the shoots have pushed some inches you may then prune with little risk of injury to the Vines from bleeding; but there is some skill required in the process; the shoots should be removed so as not to entirely divest the plants at once of the young foliage they may have made when the operation is commenced. The mode, whatever its general effect on the Vines may be, will certainly call into action latent buds at a much later period of the season than if the sap had been urged towards them in consequence of an early winter pruning.‖

RIGHTS: *Llw.* It is said that if all men had their rights every man would be a king. Do not be foolish, but make up so trumpery a quarrel. You will gain much more valuable information by studying the New Testament than by perplexing yourself with "Every Man his own Lawyer."

ROSES: *W X W.* Next week.

RUSSIAN HOUSES: *Jean Baptiste.* In the Garden of St. Petersburgh heat is obtained from steam, conveyed in pipes, and from stoves. The roofs in winter are of double sashes; and we believe that additional external covering is employed at the time of greatest severity. Wood is what they burn. You certainly may do as well in Canada, on the banks of the Richelieu, even although your very long winters nearly equal those of Russia in severity; although last winter, for three weeks, the thermometer never stood above —10° Fahr.; and although at the moment you are writing the ground is covered with snow, and your rivers are your high roads.

SCALE ON PEACH TREES: *E C T.* Wait till the fruit has been gathered, and the leaves have fallen; and then thoroughly clean your trees with hot water of the temperature of 160°.‡

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

TULIPS: —— Next week.

VERANDAHS: *W B.* Tropæolum canariense. ‡

WORMS: *W P R.* We know of nothing better than lime water for dislodging worms in pots or on lawns. ‡

ZAUSCHNERIA CALIFORNICA: *G F.* Sow your seed now in pans, and place them in a gentle hot-bed. When the plants are up gradually harden them off. It is quite hardy, and makes a good bedding plant. Colour, deep orange red. ‡

SEEDLING FLOWERS.

CALCEOLARIAS: *F P.* Quite withered up; but apparently good for nothing.*

CAMELLIA: *J T—s.* Very small and worthless.*

CINERARIAS: *L V.* Apparently a pretty variety, but too much shrivelled up to enable us to say whether it is better than Cerito or not. The colours appear to be brighter than those of Cerito. Can you send another bloom?*—*W F* and *J P.* All inferior to kinds already in cultivation.*—*W A A.* Bright in colours; but too starry, and otherwise faulty.*

PANSIES: (Name lost.) Too much withered for us to venture an opinion concerning their merits. Send them again.*

PETUNIAS: *J M B.* White, very large; but coarse and worthless, except as a border flower.*

ERRATA: One or two errors have crept into the article headed "Artistic Arrangement of Plants in Glass houses," at page 229. Where the stream is spoken of as being divided "virtually" read "vertically," and three lines farther, upon the same column, for "fallen" read "falling."

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum. Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

POTTER'S GUANO. — This effective MANURE, now greatly Improved, is confidently recommended as a Dressing for all Spring Crops. It is equal to Peruvian Guano, and 25 per cent. cheaper. Also SUPERPHOSPHATE of LIME, GYPSUM, and SULPHATE of AMMONIA, all of guaranteed quality, and Cheaper than at any other establishment in town or country.

Factory, 28, CLAPHAM ROAD PLACE, LONDON.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS,

London, April 20.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.

Direct to JOHN LEGG, Cheltenham.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.

2d. It is portable, being packed in rolls, and not liable to damage in carriage.

3d. It effects a saving of half the timber usually required.

4th. It can be easily applied by any unpractised person.

5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.

Price One Penny per Square Foot.

CROGGON and Co.'s. PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.

Samples, testimonials, and full instructions, on application to CROGGON and Co., 2, Dowgate-hill, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

Works, Sumner-street, Southwark-bridge-road.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

AGRICULTURAL SEEDS.—The following delivered free to London, or any Station on the Bury line to Norwich, at the present prices, as annexed.

GRASS SEEDS.

Best English Red and White Clovers, Trefoil, and all other Agricultural Seeds of the best stocks at the lowest market prices. PRICED CATALOGUES of AGRICULTURAL SEEDS sent prepaid on application; also prices to the trade.

Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN. Remittances required from unknown correspondents.

BASS AND BROWN, SEED and HORTICULTURAL ESTABLISHMENT, Sudbury, Suffolk.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12*s.* to 13*s.* per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

PROTECTION FROM FIRE.—Fire Annihilator Company.—MACHINES of various sizes, suited for rooms in private houses, for shops, or for cabins, or holds of ships, are now on SALE; larger machines are made, adapted for warehouses, factories, and extensive premises. Particulars and estimates, and cards for witnessing demonstrations of powers of the invention, may be had at the office, 105, Leadenhall-street, London.

AUSTRALIAN NEW LINE OF PACKETS.—The first of the above line is the ALBATROSS, of 1026 tons register; a new ship, launched in January, frigate-built, sails remarkably fast, and will be despatched on the 30th of April, for Adelaide, Port Phillip, and Sydney, New South Wales. Her accommodations are superior to anything yet despatched from this port. For terms of freight or passage apply to GIBBS, BRIGHT, and Co., 1, North John-street, Liverpool.

AUSTRALIA, NEW ZEALAND, CAPE OF GOOD HOPE, NATAL, &c.

PASSENGERS to the COLONIES generally may obtain their OUTFITS from S. W. SILVER and CO., CLOTHIERS, &c., 66 and 67, CORNHILL, at wholesale prices. SILVER and CO. make nearly the whole of the articles comprised in an outfit, to secure durability, so that the Cabin Folding Furniture may become permanent Household Furniture on arrival in the colony.

They also engage PASSAGES, and give ship sailing INFORMATION, but they neither receive nor pay a commission—their object being to give PASSENGERS who place themselves in their hands every benefit; and they forward small packages for their customers (gratis) through their AGENTS in the COLONIES.

SILVER and CO. give DRAFTS on AUSTRALIA at sixty days' sight of 103*l.* for every 100*l.* paid here.

The EMIGRANT Fitting-out Branch is at No. 4, Bishopsgate-street, opposite the London Tavern, where a comfortable fit-out for male or female, including bedding, may be obtained for FOUR POUNDS.

A Branch of each at ST. GEORGE'S-CRESCENT, LIVERPOOL.

The Agricultural Gazette.

SATURDAY, APRIL 20, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	April 24	Agricultural Society of England.
THURSDAY,	—	25—Agricultural Imp. Society of Ireland.
WEDNESDAY,	May 1	Agricultural Society of England.
THURSDAY,	—	2—Agricultural Imp. Society of Ireland.

WE desire the attention of those of our readers who are interested in the breeding of stock to the advertisement of the Highland Society, announcing that the period of entry for the sweepstakes for Short-horn Bulls, to be shown at Glasgow on the 31st July and 1st and 2d August, is extended till June 1st. The entry is open to England and Ireland, and to animals which have already carried the Society's first premium.

THE mode of paying WAGES IN KIND has so many advantages—to the labourer in dear seasons, and to the farmer when low prices prevail—that we think it may not be uninteresting to our readers to specify in detail the nature of the custom in one of the localities in which it prevails. The following statements refer more particularly to the present wages of ploughmen in the parish of Kilmany, but they are also generally applicable to the greater portion of Fifeshire. Ploughmen are invariably hired for a year from Martinmas to Martinmas. Married men generally stay many years with the same master wherever there is anything like mutual satisfaction. There are numerous instances of foremen spending their whole married life-time in the service of one master, who, if he has it in his power, seldom permits long and faithful services to go unrewarded, or to allow such individuals to come to want in their declining years. Young, unmarried ploughmen seldom remain longer than one year in the same place, arising, no doubt, from the natural restlessness of youth, and a very laudable desire to see other modes of conducting farm-work:

Wages of Married Foremen per annum.

Money	£12	0	0
65 stones (14 lbs.) of Oatmeal, at 1*s.* 2½*d.* per stone	3	18	6½
1200 yds. of Potato ground, at 3*s.* per 100 yds.	1	16	0
House and garden	2	10	0
Cow and keep	9	0	0
Allowance of bread and beer in hay-time and harvest	0	10	0
Total	£29	14	6½

Or 11*s.* 5*d.* per week.

Wages of Married Ploughmen (common workmen).

Money	£10	10	0
65 stones of Oatmeal, at 1*s.* 2½*d.* per stone	3	18	6½
182 gallons of new milk, at 6*d.* per gallon *	4	11	0
1200 yds. of Potato ground, at 3*s.* per 100 yds.	1	16	0
House and garden	2	10	0
Allowance in hay-time and harvest ...	0	10	0
Total	£23	15	6½

Or 9*s.* 1¾*d.* per week.

Wages of Unmarried Ploughmen.

Money	£12	0	0
Oatmeal (same as above)	3	18	6½
Milk	4	11	0
Allowance in hay-time and harvest ...	0	10	0
Lodging, including bed-clothes, cooking, utensils, coals, &c.	1	5	0
Total	£22	4	6½

Or 8*s.* 6½*d.* per week.

The money wages are not legally due until the expiry of the engagement, but it is a common custom

* Some farmers give only the old Scotch pint, equal to 12 gills nearly, as the daily allowance for each ploughman. The annual quantity would, in these cases, only amount to 136 galls.

for the master to pay a part at an earlier period if required by the servant. The oatmeal is delivered every two or three months in such quantity as best suits the conveniency of both parties. The milk is given daily and always new from the cow. In winter when there happens to be a great scarcity of this article, the ploughmen receive money in lieu thereof. The Potato ground is manured by the farmer, and also receives such horse-labour as may be necessary, while the ploughman furnishes seed and hand-labour. The produce of Potatoes from 1200 yards is generally about three cart-loads, or somewhere about 45 cwts., and when the crop is sound there is a surplus to assist in feeding a pig. Before the Potato disease appeared the custom was to give married ploughmen three cart-loads of Potatoes yearly instead of Potato ground, but for several years back the sometimes total destruction of the crop rendered it impossible for the farmer to fulfil his bargain.

The question of reducing the wages of farm servants has been agitated in some counties of England, but in Scotland no outward attempt has as yet been made to supplement low prices by encroaching on the hard-earned pittance of the agricultural labourer. Any relief to the farmer from this source must then be small indeed. Upon a farm of 240 acres, where four or five ploughmen may be employed, any reduction of wages could scarcely exceed 8*l.* or 10*l.* per annum; and this, though an insignificant sum to the master, would be seriously felt by the servants. The wages mentioned in the foregoing statements have varied little, for many years back, in the districts to which they refer—the only difference being that before the repeal of the Corn-laws the item of oatmeal was of greater money value than it is now; but this is of little consequence to the labourer who consumes the whole quantity bargained, and thus it matters little to him whether the food thus consumed be high or low priced.

The Scotch mode of paying wages partly in "kind" has sometimes, but erroneously, been compared to the "truck system" pursued covertly by some manufacturers, but it has no resemblance to it, inasmuch as the bargain is made with the perfect knowledge and consent of the workman *before* he enters his situation, who finds it more convenient and sure to have a certain amount of food guaranteed to him, so that he may be in some measure independent of the fluctuation of prices. The Scotch ploughman is altogether in a different position from his English neighbour. He lives in a house on the farm, supplied and upheld to him by his employer, whereas the other is often located in a village where money can be readily converted into such necessaries and non-necessaries of life as may be required. The Fifeshire system of paying wages, partly in farm produce, is one simply of conveniency to the ploughman, who prefers to have the staple articles of his daily diet, meal and milk, given to him without trouble or expense. Unmarried men seldom use all the meal they receive, and they generally dispose of the surplus to married ploughmen with large families, whose allowance is seldom sufficient to supply them with oatmeal throughout the year. In the *dear* year of 1847 married ploughmen, whose annual allowance of oatmeal was insufficient for their wants, were very poorly off, in consequence of the high price they had to pay for what they bought in. The unmarried men, on the contrary, were much better off than usual, as they got a high price for their surplus oatmeal. The agricultural labourer, in the district referred to, has generally suffered most when corn was high priced; and as, then, he did not receive any augmentation of wages, it would hardly be fair to darken his present gleam of sunshine by lowering his wages, to increase, by the few pounds thus obtainable, the sum total on the Credit side of the ledger. *H.*

PROFITS OF CATTLE FEEDING.

In an editorial article, Feb. 23d, you ask your readers to give their experience on this subject, I accept your proposal. It is right that you Englishmen should know why we Irishmen are discontented; why our lands are untilled and depopulated; why the estates of our gentry are being sold for 8½ years' purchase of the rental of 1845; and why our nobles are exchanging incomes with their agents, and thankfully accepting of 6*d.* in the pound out of the rents of their principalities, leaving the agents to scramble between the tenants and the creditors for the remaining 19*s.* 6*d.* as well as they can.

In the article alluded to, you state that your model cattle feeder sold his five Hereford oxen at 50*s.* per cwt., thereby making 85*l.*, or 17*l.* per head. On this the whole question turns: for suppose they had been sold at 13*l.* per head (and in the best market in Ireland, even that price could not now be obtained for animals weighing 6¾ cwt. each), there would then be left, not 20*l.* 5*s.*, but barely 5*s.* to pay for "the Swedes and Mangold Wurzel that five oxen ate, and for attendance, fuel, and other expenses during 15 weeks;" a profit very similar to what we are now receiving in Ireland. An Irish cattle feeder could no more obtain 50*s.* a cwt. for his fatted beast, than he could get 8*s.* per bushel for his Wheat. The present actual prices are not more than half those, and the poor farmer is robbed and plundered in every market, whether of grain or meat. If you doubt the assertion, take my experience during the present season in proof.

In the first week of October last, I tied up 16 beasts to fatten; they consisted of six heifers that I had bought two years previously for 18*l.*; a bull 4½ years old, for which I paid 9*l.* two years ago; and nine cows that had been in the dairy, which I wished to replace by young stock. Their food was excellent Swedes, and good oaten straw, regularly supplied; the cattle well littered and curry-combed every day. Having ascertained pretty nearly the weights of the cattle, both by measurement and by the opinions of competent judges, about a fortnight since I sent four of the heifers to Cork market, giving instructions to my man as to the lowest price he was to take for each, which was at the rate of about 32*s.* 6*d.* per cwt. But he sold none, and brought them all home again. I then suspected that there might be some error in the estimated weight, and to make sure, I caused the smallest of the heifers (estimated at 4 cwt., and for which 5*l.* 5*s.* had been the highest offer), to be killed for my own use. When cut up, I placed a hind quarter in the scales, and found it to weigh 113 lbs.; so that the butcher would have had my meat at 26*s.* per cwt., besides fat, hide, head, insides, &c. While my beef was being salted, word was brought to me that a person from Cork was looking at the cattle. I offered the lot to him for 100*l.*—my poverty and not my will consenting, for my supply of food was running short, and the poor-rate collector was urgent and clamorous in his demand for 118*l.* due on my three farms, containing about 400 acres; and the upshot was that I took 90*l.* cash down for the 15 beasts, which the buyer himself admitted would produce at least 75 cwt. of marketable beef. Now, can you or your English readers calculate my profit (for I perceive nothing but loss), to pay for 19 weeks' attendance, and for 10 acres of Swedes set apart for these cattle, the whole of which was either consumed or stolen. In truth, I believe one-third of the crop disappeared in the latter way. I admit, indeed, that I have a pretty heap of excellent manure; but if the straw consumed had been sold, the price of it would have purchased guano to three times the value of the dung. May I not, then, ask in conclusion, what Irish farmer can afford at these rates to grow Turnips or Wheat? Would it not be better to run the chance of even black Potatoes? *C. C. Barretts, Cork, Feb.* 28.

ON INCREASING THE SUPPLY OF MEAT.

In the kingdom of Great Britain, where the use of animal food enters so very largely into the list of articles of general consumption, the augmentation of the supply of that special commodity, in order to meet the demands of the rapidly increasing population, and also to extend the use of it among the lower orders of society, becomes a point of importance that is not exceeded in the value of the consideration by any national object in the whole circle of social and political economy. Food is the essential element of life, and being composed of different articles the value of which stands in a relative position to each other, the attention must be directed to the providing of them, in the ratio which the commercial interchange has established. Bread and beef are known to form the food of the strongest quality; labour is supported by these articles much longer than by vegetable productions, and the bodily vigour that is necessary to intellectual energy must be raised and upheld by the same means. The value of these articles has been raised to the top of the highest scale by the superior quality, and that value has placed them too far beyond the reach of the poorer population. Fluctuations occur of high and low prices, for which no cause can be seen, nor can any preventive be applied; all commercial uses are exposed to it, and the occurrence in the end is not deemed hurtful. But the quantity must be steadily increased in proportion to the uniform rise in the population; demand necessarily calls for a supply, and incites the finding of the means of production. These means are advanced along with the other improvements that are effected in the cultivation of the soil, which is the source and fountain of all organised existence. As the quadruped part of the animated world is wholly dependent on the earth for its support, both in quantity and quality, the primary attention must be directed to the cultivation of the land, in order that it may produce the greatest possible amount of the necessary articles. The performance of this most essential requisite becomes a duty and an inquiry of the very last importance.

It is now admitted as an indisputable fact that green crops form the basis of improved agriculture, both for production of corn and cattle. On whatever soils green crops can be got, other crops will invariably follow. Notwithstanding these most undeniable maxims in agriculture, an unfortunate prejudice yet exists against the use of the crops, on account of requiring much labour and manure, and an undue degree of attention. A very strong predilection for Grass lands is still entertained, arising from the latent barbarism of the mind, which adopts and adheres to the customs and practices which chance and accident have placed in use. Grass lands of the very best quality will yield a quantity of human food as large as if the land was under an arable culture; but the case is wholly different on the inferior soils, which produce few Grasses, and mostly weeds. Where such soils are wet, close draining will wholly remove the evil, and adapt them for the green crop cultivation; and for this purpose a most convenient accommodation is now afforded by the Government loans of money at 6½ per cent.

The conversion of all lands of this description from the present unproductive state into the alternate system of cropping and grazing, may be very justly placed as the first step towards the augmentation of corn and beef, which are always considered to be the staff of life. Inferior articles of food can only support animals of an inferior description, and also fewer in number than when the land is used in the production of the best known articles of nutriment. Green crop plants are now known that can be raised on all soils except the very stiffest clays, an advantage which very much encourages the arable culture of every possible kind of land. Without this well known employment of the soil, the conversion of it to aration might be more justifiably refused. The retention of lands under such disadvantages arises wholly from prejudice.

The introduction of green crops forms the most valuable revolution that ever has happened in the art of agriculture, and one of the most extraordinary events that are recorded in the annals of the progress of human improvements. The practice of cultivation has been completely revolutionised—better animals have been produced, and the supply of every kind of food has been most amazingly increased. It is a rigid law in the alterations of animal organisation, that the more the parts of it are refined, the quality of the food must be correspondingly raised; and consequently the arable culture of the land must advance with, or rather precede the improvements in the animal kingdom. The foundation must be laid on which to build the superstructure, and the durability of it must be continued, to support the constantly increasing quantity of the operations. Experience has shown that the dry food of hays and straws does not nourish and invigorate animals in any just comparison with roots; the juices are wanting, and the useful saliva that is engendered by the mastication of the esculent materials. The manure is also very inferior from culmiferous food, and becomes very much increased in value when mixed with the urine and the fæces that come from the use of rooted vegetables. This property forms one of the chief recommendations of the use of esculents.

The fattening of animals never reached any degree of perfection till the roots of Turnips and Potatoes were cultivated in a quantity to show the general advantages. The growth of the animal was slow, and the quality of the flesh was tough and meagre, and wholly wanting in the flavour and elasticity that are now procured. The number of the animals was also very deficient. The improvements that have been effected, and are now permanently established in the organisation of the animals of the farm, could not have been supported without a corresponding refinement in the nutrition afforded; both quantity and quality become requisite to uphold and maintain an enlarged and improved carcase.

The earth being the basis on which every human effort is exerted, the first attention must be directed to the condition of its capability of production, and to the means that are required for the development of its resources. The just appropriation of its uses, according to the best modern knowledge of cultivation, is the most important enquiry, in order that the quantity may be increased both of animal and vegetable food. After the breaking up of the inferior Grass lands that have been mentioned, the main object of attention must be to fit them for the production of green crops, by draining where necessary, and by paring and burning where much foggage covers the surface. As has been before mentioned, wherever green crops are got other crops will follow, and consequently more cattle can be kept, and the animals of a better quality.

Next to the conversion of the inferior Grass lands into the arable state, the better cultivation of the lands that are and have been under tillage, may be placed as an infallible mode of increasing the supply of the necessaries of life. On a very large part of these lands sufficient capital and labour are not expended, injudicious cropping is practised, and over the breadth of the kingdom the returns of crops fails by more than one-third of the easily available produce. Draining is mostly everywhere wanted, and the facility which is now offered in the loans of money by Government for that purpose is not extensively accepted. Green crops are not used to the full extent even in the fittest localities; prejudices remain to be overcome after an experience of the inestimable benefits of more than three-fourths of a century. The produce of every kind is thus curtailed; the animals of use are lessened in number and reduced in quality, and the prices of value are unnecessarily enhanced. Every enlightened observer never fails to record the universal prevalence of hurtful prejudices, antiquated customs, and bigoted practice, which most effectually retard the progress of improvements, and limit the supply of food. In order to bring about the most desirable result of the most enlightened practice, the minds of the operators must be first enlightened by education, which will enable them to see the object in prospect, and then to find the means necessary to effect the attainment. Liberality of mind is essential to the introduction of improvements, and it can only be obtained by the expansion of the intellectual faculties that arise from a varied and comprehensive learning. This enlightenment of the mind bears in the first place on

the cultivation of the earth, and is next applied to the use of the better implements of every kind, dead, animal and vegetable. The first improvement is required in the agent of operation—it must perform the first and the most necessary part, and provide for the gradual and regular progression of the connected chain of the improvements. Without this fundamental requisite, no lasting benefit will be derived, the parts will not be duly apportioned, and the necessary mutual support will not be afforded.

The "radical" improvement must begin in the enlightenment of the minds of the cultivators, in order to introduce the known practices of the greatest value, which will at least double the quantity of the produce of land of every kind, and the number of cattle among the other articles. In order to rear animals to the useful maturity, green crops must form the foundation of the system of proceeding; by these crops, the animals are quickly pushed into value, the manure that is made on the farm is greatly increased both in quantity and quality, and by that means and by the working of the land for the growth of the esculent roots, the production of the future culmiferous and leguminous crops amounts to an absolute certainty. The greater the number of cattle the greater will be the produce of grain. The want of green crops limits the number of cattle, and the existing quantity is reared in an imperfect and profitless manner. *J. D.*

Home Correspondence.

Relations between Landlord and Tenant.—There are few subjects of more general interest at the present moment than the relation between tenant and landlord; they are so mixed up together that it is almost impossible one can suffer without bringing distress and inconvenience upon the other. It is not a question of the greatest amount of rent to be paid by the farmer, or how cheap he can obtain his land, but what is the fair value of his holding, as between man and man, honestly and fairly. The landlord, on the one hand, not wishing to receive more than is just, and the tenant, on the other hand, not exaggerating the depreciation of produce. These are matters of no difficult management where the parties concerned have confidence in each other. The complaint of distress amongst all classes may be accounted for, in some measure, by individuals, during the period of high prices, living up to, and even beyond their incomes, and having nothing to fall back upon to meet the sudden change in the market. Those men who have saved money when their profits were large will now be able, by judicious management, to weather the storm, and right themselves in the course of a couple of years; on the contrary, those who never had capital to commence with, and were careless when they had opportunities of adding to the stock purse, will suffer severely, if they are not obliged to resign their farms into the hands of a new race, who will enter the field prepared to invest their cash in the land, in the same manner that a shopkeeper would in trading in soap and candles, &c. I have heard it stated in conversation that many farmers have declared that they will take care of themselves, if left in possession of their holdings for two years more; after which time the landlords may do what they please with the soil; implying that the land will be exhausted by over-cropping, to remunerate them for losses. I merely repeat what has been said, without vouching for the truth of the rumour; neither do I believe the great majority of tenants would act so madly, for their own interests; as a temporary advantage of a very questionable nature would be attended with most disastrous consequences to the landed interest and all persons attached to it, from the highest to the lowest. There is nothing more destructive to farming than full cropping without efficient dressing; and to exhaust the soil amounts to insanity, as the mischief which may be perpetrated in two years would not, probably, be repaired in half a dozen or more. Wheat cannot be much lower than it is, and farmers have arrived at a point from which they will probably advance. Food having fallen in price, everything should in proportion be reduced, which, if it was the case, we should be in much the same position as if protection was still the law of the land. Now suppose that the agricultural body were to encourage those who sold the commodities they required at a fair remunerating rate, compared with the alteration of other prices, at the same time entering into engagements with their landlords to either value their farms at a corn rent or reduce them to the standard of those who do so. There can be no question where very large fortunes are made by a few, there is much more distress existing in the country than where there are many who share in moderate profits. Let any intelligent person travel through the rural districts, who understands the difference between land well tilled, and that which is undrained and badly cultivated, and he will find a vast extent of acreage in a most primitive state, wasting its strength in the production of weeds. On inquiring the reason of such neglect, the answer will probably be, prices are so low it does not pay to spend money on the land; then surely it cannot remunerate the farmer allowing it to remain idle, having his rent to make up. I never could yet understand why land under garden management can return a profit at a rent of 4*l.* per acre, where the same description of soil under the plough is thought dear at 2*l.* per acre, and yet not 200 yards apart—similar grain and roots being sown on each. To elucidate this apparent mystery, we must conclude the man with the small holding has a capital sufficient to do his ground justice, whilst the other is over-burthened with more land than he can manage, with the funds at his command; therefore are high prices blamed because they compel exertion. In days gone by, high prices smoothed the agricultural path, and permitted the easy going tenant to rest in security; guaranteeing half a crop as enough to live upon. Now matters have assumed a different aspect, and every inch of soil must bear its fair proportion towards the maintenance of the million, or they will of necessity call in to their aid foreign grain. What has enabled the manufacturers to keep the home market to themselves and drive competitors from the field? The use of means to multiply production, such as gold and machinery, and it is only by the free use of these, added to untiring energy, that they have attained their proud position. Farmers will have to adopt much the same system, and follow so good an example. It seems rather a reflection upon England to hear it said, that foreigners can beat us in farming; it cannot be because labour is cheaper, when good workmen may be hired in the rural districts at 8*s.* per week. It cannot be because money is scarce, when any amount may be borrowed on real security at 4 per cent. It cannot be that Britons are less hardy, and more afraid of toil than those of other nations; her soldiers and sailors are evidence against such a supposition. It cannot be that the islanders are more ignorant than their neighbours, when they are generally said to have a large share of common sense. Then what is it that throws a damp over the agriculturist's spirits? All trades must advance with the age, if they expect to prosper, and farming must not be left out of the list. Land will always be a fair investment for spare cash. *Falcon.*

Farming to a Profit.—Every one will readily admit that a great improvement has taken place within the last 20 years in agricultural science; but there has often arisen a question in our mind whether a corresponding improvement has taken place in agriculture considered as a profitable trade. Farming is now becoming rather a fashionable employment; many of our aristocrats are spending their thousands in having their farms properly drained and subsoiled throughout; and very well it is for those who have plenty to spend. But is it right for those of the middle class of society to embark their whole capital in a trade, unless it can be shown that there is a certainty of a profitable remuneration. I have been struck lately in travelling through one of the southern counties with the very great differences in the modern system of farming. After passing for miles through agricultural districts in the older style of farming—small fields, innumerable hedges, glimpses of sloppy farm-yards, or of a team of horses (six horses, a man and two boys leading them), we have certainly felt relieved upon suddenly coming to an open space of perhaps 300 acres without a tree upon it all, evidently under the highest state of cultivation; ploughs hard at work (two horses and one man), and, on nearer investigation, we could discover the cattle all box-fed, and everything in first-rate style. If we were to go to the former of these farms, and ask to see his accounts, he would stare, or probably laugh and say "he did not know how to write, and therefore could keep none." Our contempt of him would then be at its height; and our esteem of the other would be heightened in the same proportion when, in reply to a similar question, he would produce half a dozen large volumes; tell us to a penny the amount of food each ox had eaten—to an inch the length of land each horse had trod, and to a shilling the money that had passed through his hands. But let us go to the bankers, and see how much remains in the said gentleman's hand, and how much in the old farmer's whom we so despise, and we shall find that as far as money is an object the latter is the best farm. Though praise and admiration are very well in their way, they are not very satisfying things to live on; and we certainly would advise those farmers who have wives and children depending upon them, to think rather less about the *appearance* of their cattle and fields, and look to stricter economy in the more important items of labour, seed, and manure. *L. H. P.*

Threshing Machines.—I should have regretted the accidental error that crept in my last communication if it had not brought forth the ability of your correspondent "Lusor." It is to be hoped he will continue to give his information, as there are few objects of more importance to the farmer than a speedy and an easy threshing machine. I should be much obliged for his or any of our readers' opinion, as I am about altering mine. "Lusor" states that the rollers probably take off one-sixth of the power, but I should say nearer one-half than one-third, when it is taken into consideration the length of time a sheaf is under operation, and that the rollers have, in Scotch machines like mine, the greatest part of the weight of a heavy close concave, which is raised with the top one when taking too much feed. If I discard them and feed near the summit of the drum, as "Lusor" recommends, I am at a loss how that should be done without reversing the motion of the drum and taking away the revolving rake, for my machine has the mouth of the rollers, the axis of the drum, and the axis of the revolving rake, all in a line; in which case, to be out of their way, the feeder would be placed inconveniently high. Would he propose the old drum and a new hollow concave, or would he, as there will be required a counter-shaft to reverse the motion, prefer both new, and about the size they are generally made? The engine could be reversed, but the other machinery attached will not permit it. Whose principle of drum and concave would he prefer? The barn work of Mr. Wood's machine offered the least resistance to the dynamometer at Norwich. Does "Lusor" know the principle, and will he give that knowledge to your readers; and is he acquainted with the form and manner of working of Messrs. Garrett's prize machine? and give that as well. One of your subscribers wishes to know the "best mode of applying steam-power." To make the most of the fuel it will require a double cylinder engine, the small cylinder to work with high pressure steam, the large one to be worked with the steam when having done its duty in the small one, and when used in the large one, then to be condensed, to have a fixed tubular boiler, large in comparison, to expose a great surface to the flame and heated air, to make the most of the fuel; to have a high chimney, to get a powerful draught; and a self-regulating damper, to regulate that draught, or it will cause a great loss of fuel, but as the first cost of such an engine will be great, and as skill to manage such an engine will be very expensive, I should say that a high pressure engine will be had for a much less cost, and as any sharp man will be able to manage it, one of that description will be most suitable for farmers generally; but it should be made with its ports and passages so large as not to be less than an eighth of the area of the piston, which should be a correct metallic one; the length of the stroke should not be more than twice the diameter of the cylinder, the piston to travel not less than 200 feet per minute, to be assisted by a good fly-wheel, and the steam to be cut off at one-third of the stroke. This can be done by a very plain movement, described in the "Artizan" for last March, but it will require it to be divested of the apparatus adopted for locomotive engines, to enable the engineer to cut off the steam at any point whilst the engine is running. The boiler should have not less than one foot of space exposed to the flame and heated air for every square inch of area on the piston, and for every 10 feet of heated surface not less than 1 foot of grate. The boiler that will take the least trouble is a long cylindrical one, no larger in diameter than will just admit a person to clean it, and then it will be longer and take more of the heat from the fire. What is most against this sort is, that it takes so long a time to boil; this may be obviated by having the diameter larger, the length shorter, and a flue about 14 or 15 inches through it. This boiler will hold much less water to boil, and consequently take less time to get up steam, which will be both saving of fuel and time. The boilers of steam-engines require our utmost care to discern those of the best principle, for in the "Patent Journal," in the monthly part for last December, the editor, in an article on "Furnaces and fire places," states, "that in them generally the waste of heat is so great that from three-fourths to four-fifths of the fuel is unnecessarily expended," and in a calculation he shows that, in an engine chimney which evolved 19,000 cubic feet in a minute, there was as much heat lost as would supply an engine of 200 horse power, as he frequently found the heat of the air at the base of the chimney from 700° to 800° Fahrenheit, almost four times the temperature of boiling water. What would be a better subject for a prize essay by our Royal Agricultural Society than one to be adopted by farmers of this waste heat, and the heat from the waste steam of high pressure engines? One way of employing the heat of the fire after leaving the boiler would be to let it go under and round a sheet iron vessel, which could be used as a kiln for drying grain or other articles, and the waste steam could be used for cooking food for cattle, or for steaming bones, which, after a few hours subjection to that heat would very easily be broken with a wooden mallet; but, in either case, the ready exit for the steam must be provided, or the power of the engine would be greatly diminished. *Richard Nicklin, Isle of Man.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Professor Way, Consulting-Chemist to the Society, delivered a lecture on the Chemical Principles of Cheese and Butter-making, before the members of the Society, at their house in Hanover-square, on Wednesday last, the 17th of April; the Earl of Ducie, Vice-President, in the chair.

Lecture on the Chemical Principles of Butter and Cheese-making.—Mr. Way commenced his lecture by stating that on two different previous occasions he had had the pleasure of bringing before the Society subjects upon which he had been personally engaged, and to which, he hoped, his investigations had brought some additional knowledge. The lectures he alluded to were those on guano, and on the absorptive powers of soils. But it was not in the nature of things, however desirable it might be, that he should be able to bring before them on each occasion some subject new to the agricultural world. In the present lecture he should merely embody in a condensed form that information which his hearers could, if they sought it, find equally well, or better given, in books. There was, however, good reason to believe, that truths, when orally enunciated, possessed ten times more penetrative power (if he might so say) than any power of written language could infuse into them. To this circumstance, and to the obvious importance of recalling to our minds from time to time the great principles involved in the practice of agriculture, he must trust for the success of the present lecture. He must be excused for once more remarking, that a fundamental part of the plan of these monthly lectures was, in his mind, the opportunity for

subsequent remarks by the members present, and he hoped they would freely offer such observations as might occur to them. They lecturer went on to say, that to understand the circumstances affecting cheese and butter, they must first of all examine the composition of milk. The popular knowledge of milk was that it consisted of butter, cheese, and whey,—at least these were the three parts into which it was usually seen to be capable of separation; but this division of the ingredients of milk left out of the question a substance of whose existance in milk many people were entirely ignorant, but to which, in a philosophical point of view, the greatest amount of attention was due—he meant the sugar of milk. In a chemical point of view, milk consisted of five parts, butter, curd, milk sugar, water, and saline matter. The diagram on the wall gave the relative quantities of these ingredients in different kinds of milk.

COMPOSITION OF MILK.

	Woman.	Cow.	Ass.	Goat.
Casein (pure curd)	1.52	4.48	1.82	4.08
Butter	3.55	3.13	0.11	3.32
Milk Sugar ...	6.50	4.77	6.08	5.28
Saline matter ...	0.45	0.60	0.34	0.58
Water	87.98	87.02	91.65	86.80
	100.00	100.00	100.00	100.00

The sugar of milk, it would be seen, existed in considerable quantity in it, equalling in the cow the weight of the curd. In England, he believed it was never prepared for domestic or other purposes; but in Switzerland it formed a considerable article of commerce. Mr. Way exhibited a specimen of milk sugar, and observed that it would be found to possess only a slightly sweet taste, which was due to its very limited solubility. This circumstance prevented its extensive use as a substitute for ordinary sugar, because it could only be employed in the form of a syrup, and required so much water to dissolve it as greatly to reduce the strength of any liquid to which it was added. Now, milk sugar, although by itself, or in solution in pure water, it would keep well, was very liable to change when in contact with bodies having the nature of ferments. Milk was, when drawn from the cow, slightly alkaline to test-paper; but in a short time it became sour and curdled. This souring was due to the production of an acid from the sugar, which had, from this circumstance, been called the *lactic acid*, or the acid of milk. The same compound was formed in many other circumstances, and its production was not confined to milk sugar, but occurred in the other forms of sugar. Thus lactic acid was produced when Cabbage is cut up and allowed to become sour, forming the sour-krout of the Continent. The sourness of brewers' grains is due to the same acid. Mr. Way exhibited a diagram which showed how easily the sugars could pass into lactic acid.

RELATION OF SUGAR TO LACTIC ACID.

	Carbon.	Hydrogen.	Oxygen.
Cane Sugar	12 equiv.	12 equiv.	12 equiv.
Grape Sugar	12	14	14
Milk Sugar	24	24	24
Lactic Acid	6	6	6

Thus milk sugar was in relation to the acid in question of such composition that one equivalent or combining proportion of it could, without adding to or subtracting from its component parts, produce four equivalents of lactic acid. Now in the natural souring of milk this transformation occurs, but the question arises, how is it brought about? Mr. Way had before stated that ferments in general had this power of acidifying milk sugar. It was an axiom with chemists that ferments are substances in a state of decay, and in virtue of that state capable of imparting it to other substances. The difference between a ferment and a fermentable substance was in general this: The body producing a ferment was liable to change by simple exposure to air. The body in which the fermenting process can be induced is not liable to change by exposure to air, but in the presence of the ferment is capable of ready conversion. The class of ferments generally contain nitrogen; the bodies liable to fermentation do not. Mr. Way had collected in a Table some of the more important of the proximate principles containing nitrogen, and also some of those which do not contain this element.

NITROGENOUS PROXIMATE PRINCIPLES (Mulder).

	Gluten of Wheat.	Casein from Milk.	Fibrin from Blood.	Albumen From Eggs.	Albumen From Blood.
Carbon	54.75	54.96	54.56	54.48	54.84
Hydrogen	6.99	7.15	6.90	7.01	7.09
Nitrogen	15.71	15.80	15.72	15.70	15.83
Oxygen	21.93	21.73	22.13	22.00	21.23
Phosphorus ...	...	...	0.33	0.43	0.33
Sulphur	0.62	0.36	0.36	0.38	0.68
	100.00	100.00	100.00	100.00	100.00

NON-NITROGENOUS PROXIMATE PRINCIPLES.

	Starch.	Gum.	Cane and Beet-root Sugar.	Grape Sugar.	Milk Sugar.
Carbon	44.47	45.10	44.92	40.47	42.57
Hydrogen	6.28	6.10	6.11	6.59	6.44
Oxygen	49.25	48.80	48.97	52.94	50.99
	100.00	100.00	100.00	100.00	100.00

Amongst the former would be found casein, the name given by chemists to the principle which is found in the curd or cheese of milk. Casein, as it existed in milk, was in a fluid or semi-fluid state, but most people were familiar with it in the form of curd. If the curd of milk, carefully separated by pressure from the whey, was exposed to the air, it soon began to acquire a putrid smell; in this state it would, if mixed with sweet milk, rapidly cause it to turn sour. The same thing happened in the case of the natural souring of milk; by the exposure of the casein to the air it underwent a change which enabled it to act upon the milk sugar, converting it into lactic acid. This souring of milk was influenced by a variety of circumstances, to some of which Mr. Way would allude presently; but his present object was to explain and to enforce upon their attention the consecutive changes occurring—first, by the action of the air on the curd, and, secondly, by the influence of the ferment so produced upon the sugar of the milk. A right understanding of these changes would simplify and explain the greater part of the phenomena which presented themselves in the operations of the dairy.

It was well known that the most minute precautions were necessary in the management of a dairy. One of the most important of these was temperature. The action of the air upon nitrogenous substances was, in all cases, favoured by a moderate elevation of temperature. Practically this circumstance was well understood and applied in the construction of dairies, which were usually sunk below the level of the earth, and were as far as possible shaded from the direct rays of the summer's sun. The use of water as a means of regulating temperature was also known. The plentiful sprinkling of the walls, the floor, and the benches, being intended to reduce the temperature by the cold produced in evaporation. But Mr. Way thought that, by a little ingenuity, much greater advantage might be taken of this well-known law of evaporation. Thus, for instance, it seemed to him perfectly practicable to imitate in dairies the methods of producing cold which were practised in hot climates. One of these was to cover the openings of communication with the external air by mats kept constantly wet, which insured a cool and refreshing breeze. In many instances where the command of water existed, this practice might be worthy of imitation in dairies. The colour of the walls was another not unimportant circumstance in the formation of dairies. In one instance he had known of a large dairy constructed of wood being painted black, or rather being covered with tar. As black is the colour of all others the most absorbent of heat, the results may be guessed. Scrupulous cleanliness is another of the essentials of dairy management—the scalding and cleansing and airing of the milk-pans, and other utensils, being of the first consequence. The reason of this was also obvious; any minute portion of milk left from one operation would necessarily become so changed by the next as greatly to hasten the internal chemical changes in the milk. Another class of phenomena was connected with the extraordinary power of minute and inappreciable quantities of animal effluvia to produce change in such a delicately compounded fluid as milk. Thus, it was a rule never to have a dairy near a stable or other bad smell; there must be no drain near it, no meat kept in it, and the cheese itself should, where possible, be separated as far as possible. In these cases, as indeed in all cases of noxious effluvia, it was believed that excessively minute quantities of decomposing animal matter were carried in the air, rapidly inducing changes of a chemical nature in substances susceptible of such changes. In the case of milk, the phenomena were all referable to the tendency of casein to undergo change, which was much enhanced by exposure to impure air.

Mr. Way said that he had now shortly to call attention to the curdling of milk. It was seen that the natural souring was due to production of lactic acid; but in what way did this bring about a separation of the curd? This question was best answered by examining the properties of casein. Casein, or the curd of milk, was but slightly soluble in water, but very soluble in a weak solution of an alkali. In milk, casein was kept in solution by a small quantity of soda, which accounted for the alkalinity of the milk when fresh drawn. Upon the formation of the acid, this latter seizes the soda, thus depriving the curd of its solvents, and the consequence was that the curd was immediately set free. The separation of the curd from the whey was assisted by warming the milk; this was the reason why milk, slightly sour, but not curdled, became so when added to hot tea. If this explanation of the curdling of milk was correct, the same result would be obtained by the use of vinegar or muriatic acid; and Mr. Way showed that these acids would curdle fresh milk. The lecturer then went on to say that he would make a very short sketch of the different operations of butter and cheese-making.

Cream.—Cream, he stated, was merely a concentration of milk; the butter, by its lightness, rising and carrying with it a certain quantity of casein; it was therefore merely a mechanical separation. Clouted or Devonshire cream was butter with a larger quantity of cheesy matter, and therefore less wholesome than ordinary cream. Cream cheese was one step further than Devonshire cream, being a mixture of casein and butter with a considerable quantity of whey not pressed out. To this circumstance was attributable the impossibility of keeping cream cheese sweet more than a few days. There was a method of preserving cream and milk sweet for some time, which was interesting in a chemical point of view. It consisted in the periodical heating of the milk or cream to the boiling point. If this were done every morning or second morning the milk may be preserved for several weeks. In the same way if fresh cream be bottled and well corked, the bottles then placed in cold water gradually raised to the boiling point, it will be preserved for months. The explanation in these cases is that, by a temperature of 212° Fahrenheit, the quantity of ferment produced by the action of the air on the casein is destroyed; if no further contact of air takes place, the change of milk sugar into lactic acid is suspended; but if the milk be exposed to the air after boiling, a further quantity of ferment is produced, to destroy which, before it greatly accumulates, recourse must be again had to the process of heating.

Mr. Way thought it possible that the bisulphite of lime, the use of which had excited so much attention lately as a means of retarding the fermentation of the juice of the cane, and the Beet-root, in the preparation of sugar, might be advantageously employed in the preservation of milk; but possibly the inventor had contemplated this application of his process.

Butter.—The separation of butter in churning was considered a mechanical process, but there were one or two circumstances which seemed to favour the notion that chemical action of some kind occurred during the operation. The circumstances affecting the butter were the same as those affecting the milk. Butter was never entirely free from casein and milk sugar. The casein, although it did not exceed one-half per cent. of the weight of the butter, yet was sufficient to make the preservation of butter difficult. The methods of preserving by salting and pressure were intended to meet this tendency of butter to become rancid—here, again, possibly the bisulphite of lime might be useful. There was a method of preserving butter for domestic purposes described in Mr. Rham's "Dictionary of the Farm" (p. 113), and which was founded on the separation of the casein and the buttermilk. It consisted in melting the butter and allowing the casein and water to separate and fall to the bottom. The solid butter thus obtained was less finely-flavoured; but it kept better, and was much preferable to salt butter for pastry and other such purposes. To remove the turnipy taste in butter, Mr. Way recommended either stirring the milk as it is drawn, or the addition of a little saltpetre; or the adoption of the Rev. Mr. Huxtable's plan, namely, adding to each gallon of the milk a table-spoonful of the clear solution of half an ounce of chloride of lime (or bleaching powder), in a gallon of water. In respect to the theory of the formation of butter in the cow, Mr. Way remarked that it was believed that although fat (and by parity of reasoning butter) could be formed from the starch and mucilage of the food, that in the presence of sufficient oily matter it was not likely that any such production of fat should take place; then came the question how far oily foods would increase the yield of butter. It must not be lost sight of, however, that butter consisted of two fats—a solid and a liquid; and that, according as the one or the other predominate the butter was firm or soft; the oils might possibly increase the quantity, but would the quality be good? He would suggest as an experiment of physiological interest an attempt to feed a cow with a mash in which suet as a solid fat should be introduced. By proper measures, best known to dairy-farmers, a cow might be made to eat this perhaps, and it would be interesting to know the results on the quantity and quality of butter.

Cheese.—Mr. Way remarked that the curdling of milk was due as before explained to acids, which combined with the soda of the soluble curd. In general the production of acid in the milk was brought about by the use of rennet, which was a ferment produced by the exposure of the lining membrane of the stomach of a calf to the air. The use of rennet presupposed of course the destruction of the milk sugar, and therefore the whey was sour. In Germany and Switzerland, and particularly in Holland, the acetic and muriatic acids were used to curdle milk for cheese. Mr. Way exhibited a diagram of the composition of cheese, which would show that although we believed cheese to be dry, it still retained a large quantity of water.

COMPOSITION OF CHEESE (Johnston.)

	Skim Milk Cheese.	Double Glou-cester.	Ched-dar.	North Wilts.	North Wilts, 2d Specimen.	Dun-lop.
Water ...	43.82	35.81	36.04	35.58	44.80	38.46
Casein ...	45.04	37.96	28.98	25.00	28.16	25.87
Butter ...	5.93	21.97	30.40	30.11	23.04	31.86
Saline matter	5.18	4.25	4.58	6.29	3.99	8.81
	100.02	99.99	100.00	99.98	99.99	100.00

The relative richness of cheeses was due to the quantity of butter in them. The rich cheeses were those which it was most difficult to keep. The thorough salting and perfect washing of the curd also rendered cheese liable to change, although, as in the case of butter, every precaution in this direction was unfortunately opposed to the production of cheese of good flavour; those cheeses that keep best, as the Dutch and Suffolk cheeses, being far less agreeable to eat.

Before he sat down, Mr. Way wished to make one or two observations upon the effect of dairy cultivation on the land. Obviously by exporting butter and cheese from a farm, we export the same elements as in ordinary Wheat, beef, and mutton farming. In addition, however, to the carbonaceous and nitrogenous elements so exported, a quantity of mineral matter, chiefly phosphate of lime, is removed by the cheese and in the bones of the calves. In old pastures this was never replaced,

until the practice of manuring with bones came into use. Bones, as exhibited in the diagram, contain 50 per cent. of phosphate of lime.

COMPOSITION OF BONES.

	Thomson.			Valentin.

* Phosphate of magnesia.

The organic part was composed of oil and gelatin, the latter of which was a nitrogenous substance, as shown in the diagram below.

CARTILAGE OF BONES—(Gelatin).

Carbon	50.50
Hydrogen	6.90
Nitrogen	18.47
Sulphur	0.56
Oxygen	23.57
Total	100.00

Now it had been found that 1000 lbs. of milk contain phosphoric acid equal to about 3 lbs. of phosphate of lime. Mr. Curwen found that in a mixed dairy of long and short-horns on an average of four years 3700 quarts of milk were annually produced by each cow. Upon this calculation about 27 lbs. of phosphate of lime would be annually carried off, and that without taking into account the bones of the calf removed. To replace the phosphate of lime ½ cwt. of bones must annually be added for each cow that was kept. By a further calculation Mr. Way showed that if the use of bones were to replace the nitrogen carried off in the milk, about 15 times the quantity would be requisite that was needed for the replacement of the phosphate of lime.

It must be believed, then, that although the nitrogenous matter of the bones was highly useful to pasture lands, the phosphate of lime was the principal advantage in their application. If a contrary creed were maintained, it was plain that the application of the nitrogenous matter was attended with an unnecessary waste of phosphate of lime. To the one class of believers, the mineral phosphate of lime, or coprolite, and the African and other phosphatic guanos, were open; to the other, the employment of ammoniacal manures like the sulphate of ammonia. Under any circumstances, Mr. Way thought that Peruvian guano would act with the same kind of benefit as bones.

At the conclusion of the Lecture, the noble Chairman detailed to the meeting the immediate and permanent effect of bones applied at the rate of 2½ qrs. or 20 bushels per acre, on some of his dairy land on the sandstone in Gloucestershire, where the largest dressing of the richest manure had produced no appreciable result. He had accordingly become a purchaser of bones to a great extent.—Prof. Way alluded to the advantages to be derived from employing dissolved coprolites for the Turnip crop, on land deficient in phosphate of lime, of which that mineral contained a large proportion. He had received from Cheshire a specimen of what was there called, from its external appearance, a grey "marl," but which on chemical examination was found to be no marl at all, as it contained no chalk; but it contained, instead, a large proportion of phosphate of lime, and it was to such substance that the value of the marl in question for dairy land was due.—Col. Challoner made some remarks on the different modes employed for the separation of curd, either artificially by the direct application of acidity, or naturally by the conversion of a part of the sugar of milk into lactic acid.—Mr. John Bethell having observed that he doubted whether the dissolved coprolites would be found cheaper than bones, enquired of Prof. Way, whether there was any mode of preventing the small quantity of milk, left in dairy utensils, from contaminating the fresh milk added to it.—Professor Way thought that carbonate of soda would be the simpliest corrective for that evil, neutralising, as it would, by its alkaline properties, the acid generated in the old milk, by exposure to the atmosphere, and consequent decomposition.—Mr. Fisher Hobbs, during his visits to the counties of Leicester and Suffolk, had found, that in the Leicestershire dairies the cheese was obtained before the butter, while in those on the poorer pastures of Suffolk, the butter was obtained first. He was desirous of ascertaining whether this practice was followed simply from local custom, or whether it was connected with the different animals employed in those counties respectively for dairy purposes, and a different mode of feeding them. The domesticated ox was now chiefly regarded as an animal machine for the production of milk, or the laying-on of flesh, and experience had proved the tendency of different breeds of cattle to the one or other of these results. The late Lord Spencer had short-horned cattle, and Alderneys, fed and tended precisely in the same way, and under the same circumstances, but the result was quite different in each case, according to the characteristic tendency of the respective breeds, the short-horns developing their resources in the formation of flesh, and maintaining their high condition, while the Alderneys yielded to the dairy the assimilated store of their high feeding in an abundant supply of the rich st cream, without gaining flesh to themselves, or improving their condition.—On the motion of Sir Robert Price, Bart., M.P., seconded by Colonel Challoner, the best thanks of the meeting were then voted to Professor Way for his kindness in delivering before them so interesting a lecture on that occasion.

American Churn.—At the request of Colonel Challoner, the Secretary laid before the meeting the correspondence in which he had been engaged on the subject of the American air-churn, which had recently attracted much public attraction: from which correspondence it appeared that the operation of the churn in question would be exhibited by the patentee at the weekly meeting of the Council on Wednesday next, the 24th inst., at 12 o'clock, when all members of the Society, who wished to be present, would have the privilege of admission.

Reviews.

The Modern Dairy and Cowkeeper. By Cuthbert W. Johnson, Esq., F.R.S.

This little book is a useful compendium of facts connected with the management of cows. It treats perhaps too much of the theory of the subject, giving too many extracts from the writings of scientific men; but the reader will find a great deal of information upon the practical details of the subject as well. It is the production of one who has long been well known as a good agricultural writer; and though it is of course rather a condensation of previous publications on the subject, than the statement of a personal experience by the practical man, yet it will be found to contain probably as much useful information as the latter could give.

Calendar of Operations.

APRIL.

South Hampshire Farm, *April* 15.—The weather during the month of March has been as favourable as could be desired for the sowing of Lent grain, and also in forwarding the tillage of fallows intended for Turnips and other root crops. The showers we have had during the present month have also proved as seasonable as the late dry weather, inasmuch as the growth of Grass is now very rapid, and in many cases it is much wanted, particularly upon farms where the Turnip crop is nearly exhausted. The horse labour upon the farm during the past month has been chiefly ploughing land after the Turnip crop has been fed off, for Barley, Oats, &c., the sowing of which we have nearly completed; indeed we have finished sowing our Barley for some little time, and the remaining portion of our land, after Turnips, we prefer sowing with a mixture of Oats and Barley, intended for horse feed, as we have invariably found we cannot grow a good sample of Barley, if sown later than the middle of April, whereas in the mixed corn intended for home consumption the quality is not of so much importance. The horses have also been employed in ploughing, harrowing, rolling, &c., forwarding the tillage for Turnips, Carrots, &c.; also rolling seeds and harrowing the Wheat after Italian Rye-grass seed has been sown. Odd horses have been continually employed in carting hurdles for the removal of sheep, carting stones off the Clover seeds, carting manure from the cattle pens and spreading evenly over the farm-yard, and other jobbing work, such as will always be required upon a farm having any pretensions to common decency and appearances. The late rains have also compelled us to apply the horses to the threshing machine, for the purpose of threshing the remaining portion of our Oat crop, which we have now completed, and which has yielded quite equal to our expectations. Our labourers have been employed in draining the meadow land, and also some portion of the land intended for Turnips, besides which they have been engaged in various work, such as water furrowing, hedging, trenching in meadow land, planting quicks in the vacant hedges, and cutting the borders round the fields, and burning for a supply of ashes at all times useful for mixing with manures for Turnips, Carrots, Mangold Wurzel, &c. Our shepherds have been fully employed ever since the commencement of Turnip feeding in attending to their flocks, by feeding at regular intervals—a matter of much importance in sheep feeding, in our estimation, as we have always found that quantity and quality of food will not produce the desired effect in fatting sheep and lambs, unless given with regularity. Our fat lambs reared from the horned Somerset ewes are now nearly all sold, as also many of the ewes after having fatted their lambs; our lambs this year have proved fatter than we ever remember in any former season. Those for which we obtained the premium at our fat cattle show on March the 25th, at Botley, weighed from 80 lbs. to 84 lbs. each, at from 20 to 22 weeks old, fed in the open field; the mothers of them being sold fat, and very heavy weighers, on the same day. Our Southdown lambs, although not quite so forward as upon some former occasions, a few of which we have sold, weigh from 10 lbs. to 11 lbs. per qr., for a pen of which we also received a premium at the above named cattle show. We wish we could speak well of the prices we are receiving for our sheep and lambs; the sale of late has been very heavy, and at anything but good prices. Our dairy cows have nearly all dropped their calves, and are doing well, there being now a good spring of Grass, and they being free from the epidemic, which has proved such a drawback in former seasons. The heifers, which we keep in yards two together, all the year through, seem to be doing well, having been fed upon a bushel of cut Swedes each per day, with a liberal allowance of Barley or Oat straw, which we consider to be the cheapest and also the best food during the winter months for young animals intended for dairy purposes. The work of the farm during the next fortnight will be sowing the remaining portion intended for Oats, preparing land, and sowing the Carrot seed, which we do by drilling on the flat, about 15 inches between the rows, using 4 bushels of superphosphate of lime with 16 bushels of ashes per acre; we prefer sowing the last week in April or the first week in May than at any earlier period, because we have time to destroy one crop of weeds before sowing; the land being rolled fine and close about a fortnight before we wish to drill, gives time for the weed seeds on the surface to vegetate, and then by using the scarifier before the drill they are effectually destroyed, which very much diminishes the labour of hoeing whilst the plant is young. Our Cow Cabbage will also be planted in a few days, and at the beginning of May we shall be busy dibbling our Mangold Wurzel. We found last year that the Mangold Wurzel grew well manured with 2 cwt. of Peruvian guano, 4 bushels of superphosphate, and 20 bushels of ashes per acre, sown broadcast, and stitched up at 2 feet apart in rows. *J. B.*

Notices to Correspondents.

Cake: *C W.* Good oilcake at 7*l.* a ton is cheaper than Linseed at 6*s.* a bushel. The loss of 20 tons of Swedes may be made up, on a lot, by the purchase of 2 tons of oilcake; which will probably assist the feeding more than the Swedes would have done. But if 20 tons should be all you had they would not be replaced by the cake. Bulk as well as nutriment is needed in food. Rape cake has been successfully used by Mr. Pusey as a substitute for oilcake.

Feeding; *Anon.* Barley-meal and bran will be better in the meantime than Bean-meal. The Alderney is not good at fattening when old. It will not be a good practice to sow Rape with Oats, in order to get an autumn crop. You had better sow Italian Rye-grass. We hardly know the purport of your question; but we imagine your neighbour is not responsible for injury done to your field, sustained because your fence was bad and his swine got through.

Garden Farms: *P H.* suggests that a "Country Curate" should read "Blacker on Small Farms." He will there find many valuable suggestions for the profitable cultivation of his half acre of ground. In the absence of that I would suggest his keeping a cow, preserving very carefully her liquid manure, and also a pig. As a productive crop for the former I would sow in September next Italian Rye-grass, and manure this with the liquid. In January [if the winter be mild] he will be able to have a cutting, and if, after every cutting, he uses the liquid manure upon it, he will be able to have from eight to ten crops, producing a quantity that will surpass his expectations. As a proof of the vast production of this Grass, read Dickenson's evidence before a Committee of the House of Commons on the Sewage Manure question, taken in 1846. It is to be had at Hansard's, Piccadilly. I had forgotten to state that a tub well covered should be sunk for the purpose of saving the liquid manure from the cow.

Gorse: *W Barlow.* It is of use in comparatively waste places. It should not be sown on good land, where ordinary husbandry pays better. It is cut once every other autumn, and crushed and given to cattle.

Grass Seeds: *A Subscriber.* If your land is disposed to run to chickweed, &c., you had better wait till the Barley is up, before sowing Clover and seeds, and then hoe them in. If it is clean, sow the seeds as soon as you like, and harrow them in. For a permanent Grass meadow, see pages 125, 173, 222.

Hose for Liquid Manure: *T W T.* Will any of our readers, who have had experience on this subject, say what is the cheapest and at the same time most durable hose piping for the distribution of liquid manure.

Pigs: *E T F.* You were right, no doubt, in anticipating our advice. We have no doubt but what the disease was as we stated—rheumatism. The little horny excreseence with which you have favoured us (produced probably by the animal lying down so much) throws no further light on the disease. *W C S.*

Rape for Seed: *Constant Reader.* Sow any time early in autumn, say August, about 5 or 6 lbs. of seed, in rows 18 inches apart. There is no doubt a liability to the destruction of the plant if sown too late before a severe winter.

Rural Chemistry, by E. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

Salt and Lime: *W Barlow.* Slake lime with brine in some sheltered place, and apply 50 or 60 bushels per acre some month or so hence. Your best plan will be to do all this in midsummer, so as to be ready to apply it on the stubble in autumn.

Shanghae Fowls: *G W* will probably be able to obtain these by applying to Mr. Bailey, of Mount-street, Grosvenor-square, who advertises in our columns. For further information, see the second edition of Dixon's Poultry, pp. 293 and 296.

Spaniel: *W W.* Sulphate of zinc, 4 grains; Superacetate of lead, 10 grains; Rose-water, 2 oz. A little to be dropped into the ear every day. *W C S.*

The Anthony Churn: *A Dairyman* should apply to the curator of the museum of the Royal Dublin Society; or to Mr. Maguire, 10, Dawson-street, Dublin.

"Times": *Quercus.* Yes.

Turnips: *Walter W.* Pare and burn. Spread the ashes. Plough 3 inches deep, roll, harrow, and harrow again. When that ploughing is reduced to a tilth, cross plough at double the depth, and repeat the tillage. Sow 3 cwt. of superphosphate, broadcast, drill up in rows, 26 inches apart, and sow 3 lbs. of seed on the tops of the drills.—*W Barlow.* Sow 3 or 4 lbs. per acre, in rows 2 feet or more apart, and single out to 10 or 12 inches.

Young Clover: *A Young Farmer.* We have often folded ewes and lambs and store sheep through the summer on first year's seeds (Clover and Italian Rye-grass). Fold them till the Clover becomes too high, and then mow and put the sheep on the mown space, to be fed from the mowing of the next piece, and so on.

Markets.

SMITHFIELD, Monday, April 15.

The number of Beasts is smaller; however, the demand is still limited, and it is difficult to advance prices. Our highest quotations are exceeded in a few instances. The supply of Sheep is also less, and in consequence trade a little better in the morning, but slow towards the close of the market. There is no quotable alteration in the Lamb trade. There are only few Calves on offer, and the best kinds are making rather more money. From Holland and Germany there are 288 Beasts, 470 Sheep, and 68 Calves; and 500 Beasts from Scotland.

Per st. of 8 lbs.—	s	d	s	d	Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	2	to 3	4	Best Long-wools .	3	6	to 3	10

Ditto Shorn ...	3	6	— 3	8	Lambs	5	0	— 6	0
					Calves	3	0	— 4	4
					Pigs	3	0	— 4	0

Friday, April 19.

We are moderately supplied with Beasts, and trade is better. Prices have advanced about 2d. per 8 lbs. on Monday's quotations. The number of Sheep is small; Monday's rates are fully maintained, and in some instances exceeded. We have a fair supply of Lamb; trade is dull at late prices. Calves are much more plentiful, and it is difficult to make more than 4*s.* of the choicest. From Germany and Holland there are 118 Beasts, 110 Sheep, and 176 Calves; from Scotland 200 Beasts; and 127 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3	4	to 3	6	Best Long-wools .	3	6	to 3	10
Best Short-horns	3	0	— 3	2	Ditto Shorn ...	3	0	— 3	6

Old Clover	80	84				

COVENT GARDEN, April 20.

Vegetables are well supplied, but many kinds of winter Fruit are over, or at least very scarce. A few Strawberries have made their appearance. Hothouse Grapes are scarce and dear. Pine-apples are more plentiful. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some very good Broccoli in the market. A few frame Potatoes have just made their appearance. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb are becoming very plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

HOPS.—Friday, April 19.

Messrs. Pattenden and Smith report that there is a better demand for fine yearlings, which have become very scarce; there is also good inquiry for 1846 and 1847. The new Hops are reduced to a very small compass.

MARK LANE.

Monday, April 15.—Notwithstanding the supply of Wheat from Essex, Kent, and Suffolk this morning was small, no progress could be made with the disposal until a decline of fully 2s. per qr. upon the prices of this day se'nnight was submitted to, at which reduction foreign, with the exception of Dantzic, which was held for late rates, met but a limited sale.—The value of Barley, Beans, and Peas is unaltered.—Oats met a tolerably free sale, at a decline of 1s. per qr. from our last quotations.

Friday, April 19.—The arrivals of home-grown grain since Monday have been small, those from abroad large. This day's market was tolerably attended, and there appeared rather more disposition to purchase Wheat where it could be done at a reduction in prices, but the general amount of business transacted was not large.—Barley fully supports our quotations.—The value of Beans and Peas is unaltered.—Oats meet a better sale at improving rates.—The Flour trade is rather firmer.—Galatz Indian Corn continues to be held at 28s. 6d. per. qr. floating.—We have again to report a heavy trade in corn for the last eight days; and Wheat, owing to the large foreign arrivals, has declined 1s. to 2s. per qr. throughout the kingdom, the demand continuing adequate to the supply. The value of Barley has been fully supported, but Oats are again the turn lower. Beans and Peas unaltered. The majority of the French markets is again lower.

Liverpool, Friday, April 19.—Since Monday last the arrivals into this port, coastwise and from Ireland, are limited in amount. Although at our market to-day a few parcels of Irish and foreign Wheat were taken by country millers, and a limited quantity sold to our country dealers, the transactions altogether were very moderate. Flour continued to meet some demand at our last quotations. Barley, Malt, Beans, and Peas continued to rule dull at late prices. Oats moved slowly, but remained steady in value.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. Hartley and Co., precisely at their prices. Cut to order in panes of

Directions for use sent with each box, including bottle of Metallic Ink.

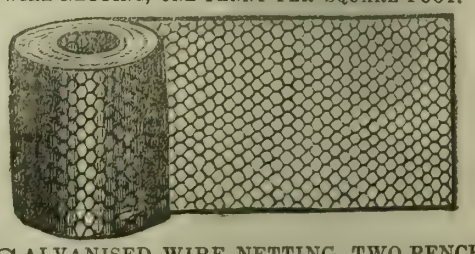
Sole agents in London, G. and J. Deane, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

BEE HIVES.

GEORGE NEIGHBOUR and SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: Wm. Drury, Castle-street, Liverpool; Hall and Wilson, 50, King-street, Manchester; Austin and M'Aslin, 168, Trongate, Glasgow.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.



ALLSOPP'S BURTON and EAST INDIA PALE ALES.—Messrs. S. Allsopp and Sons beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

TO FLORISTS, HORTICULTURISTS, &c.

MORRELL'S REGISTERED FLOWER LABELS are ready for delivery in any quantity; they will be found unimpaired by any change of weather, either of heat, cold, wet, or dry, and therefore suitable for the Stove, Hothouse, Greenhouse, or the open ground; also his improved Flower Sticks, of various lengths, from 12 inches upwards.—May be had of most Seedsmen and Ironmongers in town and country: and wholesale at 149, Fleet-street, London.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard	30 inches wide	7½d. per yard
18 ,, ,,	4½d. ,,	36 ,, ,,	9d. ,,
14 ,, ,,	6d. ,,	48 ,, ,,	1s. ,,

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

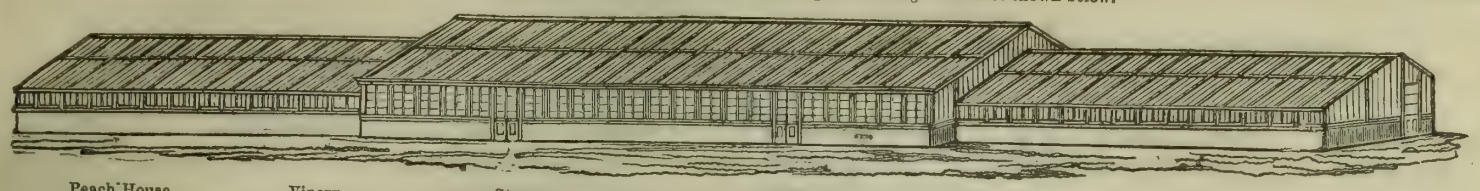
Prices.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	.. 5 0 0
Do. of 100 yards, 30 ins. wide	..	.. 6 5 0
Do. of 100 yards, 36 ins. wide	..	.. 7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.



C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

THE STANWICK NECTARINE.

MR. J. C. STEVENS has the honour to announce that on WEDNESDAY, May 15, at 12 for 1 o'clock, by order of His Grace the Duke of Northumberland, and on account of the Trustees of a Fund for the Benefit of the GARDENERS' BENEVOLENT INSTITUTION, he will offer for sale by Auction, in his Great Room, 38, King-street, Covent-garden, Twenty-four Plants of the celebrated STANWICK NECTARINE. These plants are in pots, have been propagated expressly for the Charity by Mr. Rivers, of Sawbridgeworth, and are the first specimens that have been offered for sale.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 24, and THURSDAY, April 25, at 12 o'clock, a first-rate collection of Carnations and Picotees, choice Auriculas, Climbing Roses in pots, Dahlias, Fuchsias, Verbenas, Heartsease, Pinks, also fine Geraniums in bloom, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. D. A. RAMSAY has received instructions to sell by Auction, at the Brompton Auction Ground, Fulham-road (1 mile from Hyde Park-corner), on TUESDAY, April 23d, at 12 o'clock, a choice collection of Pinks, Picotees, Cloves, Pansies, &c.; also a collection of Herbaceous Plants, comprising 300 of the leading varieties, with a quantity of Greenhouse Plants and other miscellaneous Nursery Stock.—May be viewed the day prior and morning of sale. Catalogues may be had by post, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, Middlesex.

TO NURSEYMEN, FLORISTS, &c.

TO BE DISPOSED OF, the LEASE of a NURSERY GROUND, about 2 acres, in a high state of cultivation, a substantial and convenient Dwelling-house, Greenhouse, Outbuildings, and Forcing Pits, called the "Victoria Nursery," situate near the capital market town of Uxbridge, in the county of Middlesex. The stock to be taken at a valuation in the usual manner. For further particulars, apply to Mr. Henry Morten, Hillingdon-end, Uxbridge, or to Messrs. Riches and Woodbridge, Solicitors, Uxbridge.

TO NURSERYMEN, SEEDSMEN, AND OTHERS.

TO BE SOLD, on very advantageous terms, the Stock of a small compact Nursery, and good Seed Business. The former is well stocked with trees of various kinds, Greenhouse, and other buildings; situated opposite to a railway terminus, in the vicinity of one of the principal market towns. The above is well worthy of notice.—For particulars, apply by letter only to A. B., Crosby-hall Coffee-house, Bishopsgate-street, London

---

IPPLEPEN, DEVON.

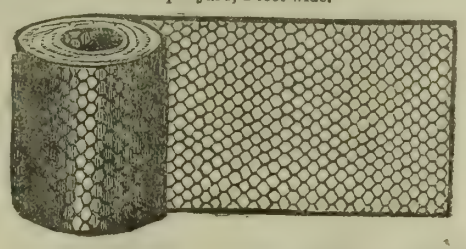
TO BE LET, at Ipplepen, Devon, for a term, furnished or unfurnished, a Pleasant and Gentlemanly RESIDENCE, fit for the occupation of a respectable Family, with about 10 acres of highly productive Garden, Orchard, and Meadow Land adjoining. The House is pleasantly situated, with a southern exposure, and Lawn in front; about five miles from Torquay, within half an hour's drive of Newton and Totness, excellent market towns, Stations of the South Devon Railway, and five hours and a half from London. Ipplepen is distinguished by its salubrity, and the unequalled beauty of the vicinity. The Dart and Teign, the best Trout and Salmon Rivers in England, are near at hand. Fox Hounds and Harriers regularly hunt the neighbourhood, and any amount of sporting can be easily obtained.—For further particulars apply to J. Lang, Esq., Ipplepen, Devon; or to Mr. R. Bastard, Solicitor, 80, Lombard-street, London.

TO BE LET, from 100 to 450 acres, in Carmarthenshire, 16 miles from the South Wales Railway. Rent moderate.—Apply to T. W. Lawford, Esq., Tirydail, Llandilo.

CONGRESBURY, SOMERSET.

TO BE LET, with immediate possession, URCHINWOOD FARM-HOUSE and Premises, with about 4 acres of Orcharding and 55 acres of Pasture-ground, 2½ miles distant from the Railway Station at Yatton. This Estate is suitable to a family of respectability. The pasturage will be ready to receive stock in about another week.—Application, prepaid, at Rhodyate Lodge, Congresbury, Somerset.

YORKSHIRE AGRICULTURAL SOCIETY.—No. 12 of the "TRANSACTIONS" are now ready, and may be had of Ridgway, London, and all booksellers, price 2s. Prize Sheets for the Thirsk meeting, 1850, may be had of M. M. Milburn, Secretary, Thirsk, Yorkshire.—April 20.



AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3l. 5s., to be had of the Maker, Mr. John Davis, Optician, Derby. The above is securely packed and sent to any part of the empire.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8s., 15s., and 21s., casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2s.; rich brown, 2s. 9d.; greens and light colours 4s. per gallon.

G. Bell and Co., 2, Wellington-street, Goswell-street, London.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. Perry being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility; and on the most moderate terms. Drawings made and estimates prepared, if required. The show rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

PAXTON'S FLOWER GARDEN.

Edited by Dr. Lindley and Joseph Paxton, And Illustrated by highly finished Plates and Woodcuts.

Bradbury and Evans, 11, Bouverie-street.

THE ONLY RATIONAL REMEDY IS

PARR'S LIFE PILLS.

THE ADVANTAGES DERIVED FROM TAKING PARR'S LIFE PILLS ARE,

1st.—LONG LIFE AND HAPPINESS.
2d.—SOUND AND REFRESHING SLEEP.
3d.—GOOD APPETITE.
4th.—ENERGY OF MIND, AND CLEARNESS OF PERCEPTION.
5th.—GENERAL GOOD HEALTH AND COMFORT.
6th.—THEY ARE FOUND, AFTER GIVING THEM A FAIR TRIAL FOR A FEW WEEKS, TO POSSESS THE MOST ASTONISHING AND INVIGORATING PROPERTIES.

To have produced a medicine so benign and mild in its operations and effects, and yet so effectual in searching out and curing disease of however long standing, exhibits on the part of Old Parr deep research and a thorough knowledge of his subject. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Direction.

Sold in boxes, at 1s. 1½d., 2s. 9d., and family packets at 11s. each, by all respectable medicine vendors throughout the world.

Wholesale London Agents:—Messrs. Barclay and Sons, Farringdon-street; Edwards, St. Paul's Church-yard; Sutton and Co., Bow Church-yard; Sangar, 151, Oxford-street; Hannay and Co., Oxford-street, London; Mottershead and Roberts, Manchester; Raimes and Co., Edinburgh; and J. Noble, Boston; and sold by all chemists.

BEAUTIFUL TEETH.

ROWLAND'S ODONTO, or PEARL DENTIFRICE. A white Powder, compounded of the choicest and most *recherché* Ingredients of the Oriental Herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in giving sweetness and perfume to the Breath. It extirpates all tartarous adhesions to the Teeth, and ensures a pearl-like whiteness to the enamelled surface. Its Anti-Septic and Anti-Scorbutic properties exercise a highly beneficial and salutary influence; they arrest the further progress of decay of the Teeth, induce a healthy action of the Gums, and cause them to assume the brightness and colour indicative of perfect soundness; while, by confirming their adhesion to the Teeth, they give unlimited enjoyment and fresh zest to appetite, by perpetuating effective and complete mastication. The Proprietors of this Dentifrice pledge themselves that its efficacy in preserving and embellishing the Teeth far surpasses anything of the kind ever yet offered to the public, and has, in consequence, obtained its selection by Her Majesty the Queen, the Court and Royal Family of Great Britain, and the Sovereigns and Nobility of Europe.—Price 2s. 9d. per box.

CAUTION.—To protect the public from fraud, the Hon. Commissioners have directed the Proprietors' Name and Address, thus—"A. ROWLAND and SON, 20, Hatton Garden," to be engraved on the Government Stamp, which is affixed on each box. Sold by the Proprietors and by Chemists and Perfumers.

ABSCESSES, PILES, FISTULAS, AND ULCEROUS SORES CAN BE CURED BY USING HOLLOWAY'S OINTMENT AND PILLS.—The very satisfactory results arising from the use of this invaluable Ointment in cases where patients have been suffering from Abscesses, Ulcers, Piles, Fistulas, or bearings down, have induced several of the medical profession, eminent for their skill, to introduce it into the hospitals and their private practice; and in many instances where the sufferer was considered incurable, Holloway's Ointment, in conjunction with his Pills, has healed the most desperate wounds after every other remedy had been tried in vain. There is no medicine known that can equal it for the cure of Scrofula, Scurvy, and Diseases of the Skin.—Sold by all Druggists, and at Professor Holloway's Establishment, 244, Strand, London.

RICK CLOTHS, TENTS, &c.—Rick Cloths of various sizes, 30 feet by 30 feet, suitable to cover 30 tons of hay, 5l. complete, with side lines; larger or smaller sizes in proportion. Tents for Lawns, Gardens, or Cricket Clubs, 36 feet round, 6 feet high in lowest part, 5l.; larger and smaller sizes in proportion. THE STANWICK NECTARINE.

MR. J. C. STEVENS has the honour to announce that on WEDNESDAY, May 15, at 12 for 1 o'clock, by order of His Grace the DUKE OF NORTHUMBERLAND, and on account of the Trustees of a Fund for the Benefit of the GARDENERS' BENEVOLENT INSTITUTION, he will offer for sale by Auction, in his Great Room, 38, King-street, Covent-garden, Twenty-four Plants of the celebrated STANWICK NECTARINE. These plants are in pots, have been propagated expressly for the Charity by Mr. RIVERS, of Sawbridgeworth, and are the first specimens that have been offered for sale.

On the same day will be sold about 150 dwarf Apples, in 6-inch pots, grafted on the Pomme de Paradis (identical with the dwarf Apple of Armenia); many of them are in a bearing state, and very interesting little trees.

ROYAL BOTANIC SOCIETY, Regent's Park.—GENERAL EXHIBITIONS, WEDNESDAYS, MAY 8th, JUNE 12th, and JULY 8d.

AMERICAN PLANTS.—SATURDAYS, May 25 and June 1.

Tickets to be obtained at the Gardens, by orders from Fellows of the Society, price 5*s.* each; or on the days of Exhibition, 7*s.* 6*d.* each; and such Tickets will admit to the Collection of American Plants, from the 3d of June to the 8th, both included.

N. B. Fruit will be exhibited on June 12 and July 3.

DAHLIAS.— Magnificent (Keynes'), 10*s.* 6*d.*, 9 certificates; Sir F. Bathurst (Keynes'), 10*s.* 6*d.*, 9 certificates; Snowflake (Dodd's), 10*s.* 6*d.*, 5 certificates; Queen of Primroses (Keynes'), 10*s.* 6*d.*, 5 certificates; Gaiety (Dodd's), 7*s.* 6*d.*, 4 certificates; Elizabeth Proctor's Fancy, 10*s.* 6*d.*, 7 certificates; Highland Chief, 7*s.* 6*d.*, 5 certificates; Flying Dutchman, 7*s.* 6*d.*, 5 certificates; Forget-me-not (Hooper's), 7*s.* 6*d.*, with all the leading show flowers of the season, are now ready for sending out, in extra fine plants, on application to JOHN KEYNES, Castle-street Nursery, Salisbury.—April 27.

MESSRS. S. AND J. DILLISTONE beg to offer the following, in good plants:

Extra Plants presented with each order. Catalogues may be had GRATIS, on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ANTIRRHINUMS UNEQUALLED.

EDWARD TILEY begs to inform the lovers of the above beautiful flower, that he will be ready to send out, after the 7th May, Five superb Seedling ANTIRRHINUMS, selected from above ten thousand seedlings. Ne plus ultra, 5*s.*; Lady William Powlett, 5*s.*; Criterion, 5*s.*; Lord Gough, 5*s.*; Major Edwardes, 5*s.*

The above varieties will be found to be very superior to anything of the kind yet sent out. They were admired by hundreds of spectators, and numerous orders were taken for them when in bloom. Blooms were sent to the Editor of the *Gardeners' Chronicle*, who spoke in the highest terms of them. "Ne plus ultra" was sent to Mr. Henderson, Pine-apple Nursery, who highly approved of it, and ordered plants. They are dwarf habited, and very free bloomers; large bold flowers beautifully striped with large flakes of various colours, some of them finely splashed and studded over on various coloured grounds, which give them a very attractive appearance—above all the older varieties. The set of 5 will be sent for 1*l.*

E. T. being a grower of all the best varieties, warrants them to give the greatest satisfaction to all purchasers. Parties living at a distance can have them sent through the post, carefully packed in stout boxes, postage and package free, on the receipt of Post-office order for the amount of plants required. A remittance or reference is expected from all unknown correspondents. The usual allowance to the trade when three plants are ordered.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath, April 27.

HORTICULTURAL TOOLS.

GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Sheare, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS, and has much pleasure in announcing that they have vegetated. Price 2*s.* 6*d.* per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire, near Coventry.

SEEDS IN COLLECTIONS.
OF THE BEST WHICH CAN BE PROCURED.

Our Descriptive Priced Seed and Plant List will be forwarded, prepaid, on application, by forwarding four postage stamps, as copies having the Newspaper stamp are now all distributed.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

NEW CONTINENTAL VERBENAS.

THOMAS BARNES has a large healthy Stock of the following new VERBENAS, which he is enabled to offer in fine Plants, 3*s.* per dox., or 3*s.* 6*d.* each, viz., Adele, Anais, Buffon, Bajeans, Cyporisse, Daubenton, La Leduisante, Madame Lecquay, Madame de Gournay, Madame Goudon, Madame Liencount, Madame Lockroy. Woodcock's Magnificent, 3*s.* 6*d.* each. Selections of last year's, 12*s.* per doz.; do. of former years, 6*s.* per doz.; collections for bedding 20*s.* per 100.

PETUNIAS.—A few more sets of T. B.'s superb Seedlings may still be had, with all the leading varieties of last and former years.

General Descriptive Catalogues may be had on application.

Danecroft Nurseries, Stowmarket, Suffolk.

UNRIVALLED SEEDLING ANTIRRHINUMS.

JAMES SAUNDERS AND SON having paid particular attention to the cultivation of the above beautiful hardy plant, have much pleasure in offering a selection of 12 from their large and universally admired collection. They will be found perfectly distinct, and cannot fail to give the utmost satisfaction. Fifty spikes of flowers were sent to Dr. LINDLEY, who describes them thus in the *Gardeners' Chronicle*, July 14, 1849:—"*J. S. A.* A very handsome collection, particularly Nos. 3, 5, 16, 19, 18, 24, 25, 27, 31, and 42, but still more particularly Nos. 5 and 42. No. 28 is a very bright self-coloured yellow. You had better select the most distinct striped and spotted ones for seed. Yours is an excellent breed of Antirrhinums for that purpose."

Blooms were also sent to and seen by a great many Nurserymen and Florists, and in every instance received the same admiration, as superior in every respect to any out, and were in all cases ordered. Many of them are beautifully spotted, others as finely flaked as any Carnation, and the whole collection brilliant in every variety of colour, perfect in shape, free bloomers, and of compact habits.

Strong plants will be sent out on and after the 6th of May, at 30*s.* the set of 12; one-third off to the Trade when three or more sets are ordered. They can be forwarded safely by post, and, when ordered so, free of postage.

J. S. and SON have also a fine Stock of Antirrhinum Seed, carefully selected from 50 of their best varieties, in packets, 2*s.* 6*d.* to 5*s.* each, free by post.—Abergavenny, April 27.

HORTICULTURAL IMPROVEMENTS.

STRAWBERRIES exceeding two ounces each in weight, and of delicious flavour, were grown on Roberts's Strawberry Tiles last season, and exhibited at the Horticultural Show at Chiswick, and at the Royal Botanic Gardens, Regent's Park, where they obtained the highest Certificate of Merit. No appliances hi herto used are equal to these Tiles for improving the flavour and keeping the Strawberries clean. This is admitted by all who have tried them. As a further proof, many persons who have tried them have had a second and third supply, and will have much pleasure in answering inquiries, if any reference is considered necessary. They are not like articles of consumption, for when once purchased they will last for many years.

CELERY and CARDOONS of the most superb quality and size were produced by the use of Roberts's Sockets, and this season he introduces a new method of growing Asparagus, which greatly improves the quality and quantity of that valuable vegetable. He likewise gives a new mode of growing Grapes, Peaches, Figs, and other Wall Fruit, and has recently registered a Ventilating Flower Pot, which will be found invaluable to Scientific and Amateur Gardeners.

An illustrated pamphlet, with particulars and testimonials, can be had by enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London, where these inventions may be inspected.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to offer the following Plants, which can be supplied immediately.

NEW FUCHSIAS (HENDERSON'S).

Prince of Orange, Fair Rosamond, Don Giovanni, Sims Reeves, Pearl of England, Grand Master, and Confidence. The set of 7 for 30*s.*, or 5*s.* each, with the usual discount to the Trade.

The Trade Supplied.

N.B. Descriptive Priced Catalogues of all the new Bedding and Soft-wooded Plants, are just published, and will be sent on application.

E. G. H. has at the present time in his establishment a few very excellent Gardeners, waiting for engagements, who can be highly recommended.

EARLY AND CATTLE CABBAGE.—A stock not to be equalled, of 400,000 stout bedded plants, superior true sorts, 4*s.* 6*d.* per 1000; also fine bedded Red for pickling, 1*s.* per 100, or 7*s.* 6*d.* per 1000, package included, delivered free of carriage to the Edenbridge station, South Eastern Railway. Address to JOHN CATTELL, Westerham, Kent. Cash expected from unknown correspondents. Seed of CATTELL'S superior "Dwarf Barnes," and his new "Dwarf Reliance" Cabbage may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz. as usual, and the latter half an ounce.

J. C.'s Annual Catalogue of Plants, for the spring of 1850, is now ready, and may be had by inclosing, with address, 1*d.* stamp.

A large stock of Strawberries, bedded plants, worth the attention of the Trade—Early Grove-end Scarlet, Princess Alice, British Queen, Downton, and Swainston Seedling.

TURNIP SEEDS.

W. SKIRVING begs to acquaint his Friends and the Public, that he has no Agent in Town or Country, and that the price of his Improved Swede, and also his Improved Purple-top Yellow Bullock Turnip Seed is this season 1*s.* per pound. All other kinds of Turnip and Agricultural Seeds in general, of the most select description, at moderate prices. A remittance, or reference, from unknown correspondents, is respectfully requested to accompany orders.

Liverpool, April 27.

WANTED, GARDEN ORNAMENTS, VASES, FIGURES, or a good DIAL, in artificial stone or terra cotta; also large TUB PLANTS. Parties having such to sell in very good condition, at second-hand prices, and in the immediate vicinity of London, may hear of a purchaser, by addressing exact particulars of the material, pattern, size and price to W. S., 8, King's Bench Walk, Temple, London.

GRASS SEEDS.—Mixtures of selected natural GRASS SEEDS, with a proper proportion of permanent Clovers, for laying down land to permanent Meadows and Pastures, to suit the soil to be laid down. Mixtures of the above for Irrigation or Water Meadows.

Mixtures of the above for Parks or Field Lawns; Italian, Perennial, and other Rye-grasses; Long Red, Yellow Globe, and other Mangold Wurzel; Swedes (various sorts), Hybrid and other Turnips; all kinds of Grass Seeds, Agricultural and other Seeds.—THOMAS GIBBS and Co., the Seedsmen to the Royal Agricultural Society of England, corner of HALF-MOON-STREET, Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

SCARLET GERANIUMS.

MARY CONWAY begs to offer good plants of the following:—

SCARLET GERANIUM "PRINCESS ROYAL" (CONWAY'S).—A splendid bright scarlet variety, of dwarf habit, and a very free and early bloomer, with a handsome horse-shoe leaf. Plants 7*s.* 6*d.* each, and the usual discount to the Trade when three are taken.

The following 15 Scarlets for 14*s.*:—Eclipse, Goliah, Ivery's Scarlet, Ibrahim Pacha, Gem of Scarlets, Mrs. Maylor, Phenomenon, Punch, Royalist, Shrubland Superb, Symmetry, Tam O'Shanter, Tom Thumb's Master, Tom Thumb Improved, and Brompton Hero. With the following seven pink varieties for 21*s.*, viz., Cherry Cheek, Judy, Jenny Lind, Lucia Rosea, Pet, Pink Nosegay, and Rosy Morn.

The following VERBENAS 12*s.* per dozen, or two dozen for 20*s.*, viz., Adonis, Apollon, Bances, Belle de Comte, Criterion, Chauveerii, Eclipse, Favourite, Gracieuse, Heroine, Lord of the Isles, General Lamoriciere, Malvina, Morphee, Madame Gabrielle de Vandeva, Madame Rattier, Princess Alice, Reine Bacchanal, Royal Purple, Virgil, Vesta, War Eagle, Reine du Jour, and Monsieur Affré.

The following VERBENAS 6*s.* per dozen, autumn-struck plants, viz., Clotilda, Emperor of China, Empress of Scarlets, Eppsii, Gem of the West, Grandiflora, Madame Passy, Vulcan Superb, Excelsa Superba, Vampa, Marchioness of Ailsa, Defiance, St. Margaret, and Picta.

PETUNIA "BEAUTY SUPREME" (CONWAY'S).—This is a splendid variety for bedding, the habit of the plant is perfection itself, forming a compact close bush, studded all over from the ground upwards with a dense mass of the most showy deep purplish crimson flowers; 9*s.* and 12*s.* per doz.

CALCEOLARIAS.—Shankleyana, new and shrubby, 12*s.* per doz.; Kentish Hero, 6*s.* and 9*s.* per doz.; Amplexicaule, 9*s.* per doz.; Viscosissima, 6*s.* per doz.; Kayii, 6*s.* per doz.; and Aurantia Multiflora, 6*s.* per doz.

HELIOTROPIUMS.—Grisau, 9*s.* per doz.; Triomphe de Liege, 9*s.* per doz.; Souvenir de Liege, the best for bedding, 12*s.* per dozen.

FUCHSIAS.—Beauty of Leeds, Brewerii, Count de Beaulieu, Crimson King, Dreadnought, Exoniensis, Etiole de Versailes, Elizabeth, One in the Ring, Purity, Prince Albert, and Scarletina Reflexa, 9*s.* per doz.; Elegance, 1*s.* 6*d.*; Newtoniensis, 1*s.* 6*d.*; Serratifolia Multiflora, 1*s.* 6*d.*; Sir Charles Napier, 1*s.* 6*d*; Splendida, 1*s.* 6*d.*; Spectabile, or Queen of Fuchsias, 5*s.*

LOBELIAS.—Erinus, Grandiflora, Lucida, Maxima, and Lilacina, 6*s.* per doz.

M. C. has also a good stock of the newest and best Phloxes, Salvias, Œnotheras, Antirrhinums, and Chrysanthemums, at moderate prices.

Earl's Court Nursery, old Brompton, near London.

STAR NURSERY, SLOUGH, BUCKS.

W. R. BRAGG begs to inform the Floral Public that his Annual Spring Catalogue contains Descriptive Lists of E. Foster's new and superlative Pelargoniums; the best varieties of Pinks, Picotees, Carnations, Pansies, Roses, &c., and may be had on application.

GIPSY PRIDE, by far the most successful Pelargonium of 1849, may still be had; also Constance, Conspicuum, Narcissus, Armida improved, and all the best show varieties of last and former years, in extra strong plants.

NEW PANSY, HUNT'S "HELEN," has gained more first class certificates in 1849 than any other variety now offered, and, beyond doubt, is quite a leading white-ground flower; plants are fine and healthy. 5*s.* each.

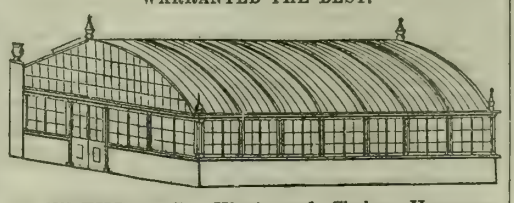
GOLDEN YELLOW DAHLIA, OLIVER'S "GOLDEN DROP," gained four first prizes and first class certificates in 1848, &c., five of each in 1849. Plants in May, 10*s.* 6*d.*

NEW FANCY DAHLIA, BRAGG'S "LADY GRENVILLE," the most successful fancy Dahlia of the year; colour, deep red, distinctly tipped with white; as a guarantee for constancy, it has received 11 first class certificates, four extra money prizes, and two premier prizes in class showing. Plants in May, 10*s.* 6*d.* Sound ground and pot roots of all the best Fancy and other Dahlias, at moderate prices.—April 27.

DELPHINIUM MAGNIFICUM, figured in "Paxton's Magazine of Botany" for October, 1849. This fine hardy Delphinium must be seen to show its great superiority over every other Larkspur yet grown, in the intense brilliancy of its blue; either in the flower garden or in the bouquet, it at once arrests the attention by its vivid colouring and fine habit. Good established plants ready to send out on the 10th of May, at 10*s.* 6*d.* each. The usual allowance to the trade when three or more are taken.

Rose Geant des Batailles, 20*s.* per dozen.
" Pius the 9th, Sydonie, Cymedor, &c.

A. GODWIN, Eycroft's Nursery, near Ashbourne.



BELFAST.

FLAX-DRESSING MACHINERY.—Persons wishing to put up Mills for Scutching or Dressing FLAX IN THE STRAW, can be supplied with the Improved Machinery recommended by the Royal Flax Improvement Society of Ireland, on application to the makers, MAC ADAM Brothers and Co., Engineers, Soho Foundry, Belfast.—April 27.

THE COTTAGER'S STOVE will cook sufficient for a Family of a dozen persons with one pound of Coal or Coke per hour, and is well adapted for Emigrants.—May be seen in operation daily at the Manufacturer's, Messrs. BENHAM and SON'S, 19, Wigmore-street, and Messrs. D. and E. BAILEY, 272, High Holborn, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

RAPID BUTTER MAKING.

ANTHONY'S AMERICAN CHURN, patented in England, was exhibited on Wednesday last before the Council of the Royal Agricultural Society of England, at their Rooms, 12, Hanover-square, when it sustained its former reputation, by producing, from 5 quarts of rich cream, 5¼ lbs. of Butter in eight minutes.

Sold at the Depôt, 97, Newgate-street, London. A liberal allowance to the Trade. Parties infringing will be prosecuted. None genuine without the Brand and Number.—April 27.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for Gardens, 1*s.* 2*d.* each. Patent Fumigation, for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

ALEXANDER SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their IMPROVED GRASS CUTTING and ROLLING MACHINES, for LAWNS, the completeness of which has now been fully proved. The Machine works with perfect ease, producing a beautiful smooth surface, and attended with a saving of labour of 80 per cent.

Extract from a Letter from Mr. Henry C. Ogle, Chief Gardener to the Earl of Abergavenny; dated Bridge Castle, Kent, October 23, 1848.

"Sirs—Your large-sized Mowing Machine, which I have had in use during the past summer, has given me the most perfect satisfaction. It is an admirable Machine for all places having a great extent of Lawn; and I feel persuaded, as its merits become better known, it will be brought into general use.—I am, Sirs, your obedient servant, HENRY C. OGLE."

A. S. and SON respectfully solicit the attention of the Farmers, Agriculturists, and others to an improved STRAW or HAY CUTTING MACHINE, which they have recently invented. The cheapness and utility of this improved Machine, combined with superior workmanship and durability, enable the inventors confidently to recommend it, as the most profitable Machine of the kind yet sent out. Further particulars and a list of prices may be had, by applying to the makers or to their Agents. Agents for London, Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; Hertford, Mr. George Folkard, Ironmonger; Liverpool, Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; Wakefield, Mr. Wm. Barratt, Nursery and Seedsman, St. Johns; Chester, Messrs. F. and J. Dickson, Nursery and Seedsmen; Glasgow, Messrs. Charles D. Young and Co., 32, St. Enoch-square; Edinburgh, Messrs. Charles D. Young and Co., 48, North Bridge; Perth, Messrs. Dickson and Turnbull, Nursery and Seedsmen.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ¾-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

NETTING, FLAGS, AND BUNTING.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FABLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

GERANIUMS.—Hoyle's Belle of the Village, 20s. per dozen.

All the above can be supplied fine plants.
James Whomes, Royal Pelargonium Nursery, Windsor.

NEW AND STRIKING VERBENA.

ARTHUR MACKIE begs to offer the undermentioned to the attention of Florists, with the fullest conviction that it will give entire satisfaction.

WOODCOCK'S MAGNIFICENT.—A. M. having purchased the entire Stock of this unrivalled Verbena, offers it to the Public with the utmost confidence, being fully persuaded that it will surpass everything yet out in its class. The individual flowers cover a sixpence, and sometimes a shilling. It is of a very free habit and growth, and well suited for grouping. See *Gardeners' Chronicle*, Sept. 15, 1849.—"*W. K. B.* Colour bright rose, fading to pink; a remarkably fine variety, with much the largest flowers we have yet seen."

Fine strong plants at 5*s.* each, free by post. Where three are ordered four will be sent.

Mackie's Descriptive Catalogue of Flower and Vegetable Seeds is now ready, and will be forwarded on receipt of two stamps for postage.—Norwich Nursery, Norwich, April 27.

RENDLE'S PRICED CATALOGUE OF PLANTS is just published, and can be had for one postage stamp.

Ever since our invention of the "Tank System of Heating Horticultural Buildings" (for which a Gold Medal was unanimously awarded to us by the Royal Devon and Cornwall Horticultural Society) we have been enabled to propagate plants in such abundance, with scarcely a failure, that we are enabled to offer them at

VERY REDUCED PRICES.

We shall have at least THREE THOUSAND DAHLIAS and FUCHSIAS ready for delivery after the 10th of May next, as well as a large quantity of Geraniums, Camellias, Indian Azaleas, Cinerarias, Verbenas, Antirrhinums, Chrysanthemums, with a large collection of Greenhouse, Hothouse, and Herbaceous plants, prices of which will be found in our new Catalogue, on application to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.
ESTABLISHED 1786.

GERANIUMS.

A LARGE AND SPLENDID STOCK OF STRONG PLANTS, AT LOW PRICES.

BASS and BROWN beg to offer the following from their superb collection.

12	all new varieties of last season		...	...	2	2 0
12	superb show varieties		...	...	1	1 0

DESCRIPTIVE PRICED CATALOGUES OF OUR EXTENSIVE COLLECTION OF SEEDS AND PLANTS supplied, prepaid on receipt of four penny stamps.

Remittances requested from unknown correspondents. Post-office orders to be made payable to Bass and Brown, or to Stephen Brown. Goods carriage free to London, and with orders of 40*s.* extra plants presented.

Bass and Brown's Seed and Horticultural Establishment, Sudbury, Suffolk.

PHLOX DRUMMONDII JARRETTII.

GARAWAY, MAYES, and Co., beg to announce that they are now prepared to supply this charming and distinct variety, which far surpasses any other yet sent out. The flowers are very large, and of an excellent form; the colour a beautiful rosy lilac, with white centre, and, like the other varieties, it continues in bloom throughout the whole of the summer and autumn months; a property which makes this tribe so desirable for bedding purposes. Good plants 15*s.* per dozen, or 1*s.* 6*d.* each.

As a further proof of its merit, the following opinions are quoted from the *Gardeners' Chronicle*, and the "Gardeners' and Farmers' Journal."

"Phlox: J. P.—Flowers rosy lilac, white in the centre, large in size, and bright in colour; a very nice variety and remarkably handsome."—*Gardeners' Chronicle*, Oct. 6, 1849.

"Phloxes: J. P., Bath.—A superb variety of a reigning favourite. This class of plants is rapidly improving, and though we have had some very beautiful specimens submitted to us during the season, we are free to confess your seedling totally eclipses them, with one exception. We do not remember having noticed a Phlox under your initials previous to the present moment, but if our memory serves us aright we have had a variety closely resembling the one before us, forwarded for our opinion early in the season. Be this as it may (for we have not time to refer), it does not deteriorate from the beauty of your flower, which is first-rate in its properties. Form good, petals flat, smooth on the edges, of desirable consistency, and orilliant; colour rosy lilac, bordering on peach blossom; centre pure white, beautifully blotched with light puce; eye circular, and distinct, size of the pip very large, and a noble trusser."—"Gardeners and Farmers' Journal."

G., M., and Co. beg likewise to recommend two other good and distinct varieties, viz., Phlox Drummondii atropurpurea: flowers of a good form; colour dark purplish carmine, with the centre almost black, forming a good contrast with the former and following variety.—Phlox Drummondii oculata: pure white, with rosy lilac eye; very pretty, 6*s.* per dozen, or 9*d.* each.

A Descriptive Catalogue for this season, containing their choice collections of Dahlias, Geraniums, Verbenas, Pansies, Greenhouse, Stove, Orchidaceous and Miscellaneous Bedding Plants, is now ready, and will be sent on application.

Durdham Down Nursery, Bristol, April 27.

JAMES WHOMES, Royal Pelargonium Nursery, Windsor, can supply fine Plants of HOYLE'S "CRUSADER" GERANIUM at 36*s.* per dozen; and every other fine variety equally cheap.—April 27.

"SUNSET" VERBENA.

MESSRS. JEYES and CO. have much pleasure in offering for Sale the above Verbena. The two eminent growers named below have described its character.

"Your Verbena 'Sunset' is quite distinct from any other scarlet. Its habit for bedding is the best we know of. The name is well applied, for a mass of its flowers has all the appearance of a declining sun.—Daniel Judd, Gardener to the Right Honourable Earl Spencer, K. G.; Walter Grey, Gardener to the Right Honourable Sir James Parke."

Plants 5*s.* each; if two are ordered three will be sent.

P.S.—The Prices of the Rare Flower Seeds advertised and described in this Paper of March 9 are—Hibiscus speciosa, 2*s.* 6*d.*; Æthionema membranaceanum, 6*d.*; Myosotis azoricus, 2*s.* 6*d.*; Pentstemon Murrayanum, 2*s.* 6*d.*; Calandrinia umbellata, 2*s.* 6*d.* per paper.—Northampton, April 27.

CHOICE SEEDLING PETUNIAS.—We have the pleasure to offer the following varieties of our own raising, which have been selected as first-rate from a large number of other Seedlings, and we trust will give equal satisfaction to the varieties we have hitherto sent out.

Magnificent, a fine rich crimson, colour and shape of "Brilliant" sent out last year, but having darker veins	5s. 0d
Castor, a large and distinct lilac, with a very rich dark purple throat	3 6
Pollox, a large silvery blush, with a dark rich purple throat	3 6
Orion, a rich lively crimson lake, of fine form	3 6
Syren, pure white, with a rich bright pink throat, good round form	3 6
Cassandra, French white, lilac pink throat, veined, edges of the corolla blotched with lively pink, large and fine	3 6

The usual allowance to the trade by taking the set, or for three plants of a sort.

12 new varieties of last season	12 0
12 superior varieties	9 0
12 fine ditto	5 0
25 varieties in choice assortment	15 0

The above free by post if required.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

TO NOBLEMEN, GENTLEMEN, AND THE TRADE.

CONRAD LODDIGES avails himself of this opportunity to tender his warmest thanks to the friends of Horticulture who have honoured with their kind patronage his late Father and Uncle so many years, and begs to assure them that nothing shall be wanting on his part to merit a continuance of the confidence which has always been reposed in their house.—The business in future will be continued as heretofore under the firm of Conrad Loddiges and Sons, Hackney.

The Gardeners' Chronicle.

In our last Number an interesting case of Bleeding at the Root was mentioned by the Hon. James Stuart Wortley. It occurred to a large Birch tree, whose roots, having been cut through, have bled so much that, although not more than 1½ inch in diameter, a neighbouring "walk has been standing in puddles, and the sap was still bubbling up through the gravel," at the date of the letter.

A similar case is mentioned by an anonymous correspondent, who says, "In lowering the ground near a large Walnut tree, some years ago, some large roots were cut through; so much bleeding took place in consequence that the tree died."

A letter received from Mr. Spencer, gardener to the Marquess of Lansdowne, at Bowood, thus describes a third occurrence of the same nature:—"This present spring, in forming a new walk, I had occasion to cut through three large roots belonging to an adjoining Beech, and which are exposed at the present time. Some time about the middle of March I observed the roots were bleeding considerably, which has continued more or less ever since, the *flow being materially influenced by the state of the weather*. By the beginning of the present month, the bleeding was sufficient to saturate the walks completely. On examining the roots, with an ordinary microscope, I observed the discharge proceeded from the whole of the exposed cells through the section; but, from the larger diameter of the vessels towards the exterior of the root, the bleeding, as a natural consequence, was greatest at that part. I observed as well that bubbles of air were frequently formed on the cut surface, evidently showing that some kind of gas was present, either in the sap or in the cells. Although in bright weather the discharge was perfectly visible to the naked eye, the assistance of the microscope enabled me to see distinctly the *downward* passage of the sap, and that through *all* the root cells, at a time when physiologists have generally agreed it has its greatest ascending power."

No doubt such circumstances are of constant occurrence, although unobserved. What gives the cases now brought forward so striking a character, is the extraordinary extent to which in them the bleeding occurred.

When stems bleed the observer is in no way surprised; firstly, because he is accustomed to the phenomenon; and secondly, because he knows that roots draw fluid out of soil, and send it *upwards*. But when roots bleed, the ordinary explanation of the phenomenon is no longer applicable; for roots cannot be said to draw fluid from the soil when they are removed from the soil; nor can it be admitted that sap is sent upwards when we see that it runs downwards.

In explaining the phenomenon of root bleeding, the first step is to consider why sap ascends. This was in part demonstrated more than a century since by our countrymen Hales. In discussing the question of the circulation or non-circulation of the sap, this great experimentalist uses the following words:—"We see in many of the foregoing experiments, what quantities of moisture trees do daily imbibe and perspire. Now the celerity of the sap must be very great, if that quantity of moisture must, most of it, ascend to the top of the tree, then descend, and ascend again, before it is carried off by perspiration. The defect of a circulation in vegetables seems in some measure to be supplied by the much greater quantity of liquor which the vegetable takes in, than the animal, whereby its motion is accelerated; for by Experiment 1st, we find the Sunflower, bulk for bulk, imbibes and perspires 17 times more fresh liquor than a man every 24 hours. Besides, Nature's great aim in vegetables being only that the vegetable life be carried on and maintained, there was no occasion to give its sap the rapid motion which was necessary for the blood of animals. In animals, it is the heart which sets the blood in motion, and makes it continually circulate; but in vegetables, we can discover no other cause of the sap's motion but the strong attraction of the capillary sap vessels, assisted by the brisk undulations and vibrations caused by the sun's warmth, whereby the sap is carried up to the top of the tallest trees, and is there perspired off through the leaves: but when the surface of the tree is greatly diminished by the loss of its leaves, then also the perspiration and motion of the sap is proportionably diminished, as is plain from many of the foregoing experiments; so that the ascending velocity of the sap is principally accelerated by the plentiful perspiration of the leaves."

The sap then ascends in consequence of an attracting force exercised from above downwards by the foliage of plants. But it is evident that this is only a partial explanation of the phenomenon; for it does not account for the ascent of sap in winter when leaves are absent. In order to explain that fact we must have recourse to the action of endosmose, a force the effect of which is to produce propulsion. A tree may be assumed to be a combination of hollow tubes freely communicating with each other, and enclosed in a skin *through which fluids are capable of being absorbed* on the one hand and expelled on the other. If we conceive a body of this kind, in which the tubes are nearly empty, to have its lower extremity plunged in water, the absorbing power of the skin at that part will begin to introduce the water into the interior, and this continuing to go on for a sufficient time the tubes must necessarily become at last filled with water rising upwards from below. To effect this no attracting force at the upper end of the cylinder was necessary; every particle of water which was absorbed by the lower end, having driven before it a corresponding volume of the water previously existing in the apparatus. Under the influence of this operation the tubes would in time become full, and if unelastic the introduction of more water would be impossible. But if such tubes and the skin that encloses them were elastic and extensible, then any such further quantity of water might be introduced as the apparatus could receive without bursting. If we then suppose that the one end of the apparatus were cut open the sides of the tubes would collapse, and the water would be forced out till there was no more left than the tubes held in their original unstretched condition.

A tree is just such an apparatus. Its tubes are nearly empty at the fall of the leaf. During winter the roots absorb water from the soil and fill the tubes again. By the arrival of spring they are filled almost to bursting, and then if the stem is cut it bleeds; or if the roots are cut they bleed.

Bleeding ceases as the leaves unfold; the Vine, the Walnut, the Birch, are all as incapable of bleeding as other trees when their leaves are formed; because the leaves gradually empty the tubes, put an end to their distension, and prevent its recurrence so long as they remain in an active state.

The excessive loss of sap mentioned in the cases that have produced these remarks could not have taken place if the roots had been wounded in the summer or autumn; and if the trees survive, bleeding will cease with the appearance of leaves. It is probable however that it has been increased by the cold

ness of the spring. HALES himself was aware that sap falls back at night in consequence of the contraction of the tubes by cold; Mr. KNIGHT observed the same fact: and it has more recently been proved experimentally by M. BIOT. It may therefore be supposed that the excessive cases of bleeding now adverted to have assumed so serious an appearance, because, in addition to the natural contraction of the tubes, the mechanical contraction produced by unusual cold has to be taken into account.

As to stopping the bleeding, it will probably be found that Mr. KNIGHT's cement will answer that purpose. The composition of this substance is as follows—To four parts by measure of scraped cheese add one part of calcined oyster shells, or any other pure calcareous earth. Blend them thoroughly, and press them with force into all the tubes and cells that are visible on the wound. The best way is to smear a layer over the surface, and to press it down gradually but forcibly with a flat board.

ONE of the follies of the day, a few years since, was the construction of VINE PILLARS, that is to say, of hollow cylinders of brickwork, filled with certain materials which were conceived to form a soil suitable to Vines. The Vine was to be introduced into the bottom of the cylinder through a hole; and the cylinder was to stand on a floor so paved with bricks that no roots could find their way downwards. In short the Vine columns were gigantic flower-pots, in which the Vines were introduced through a hole in the bottom instead of the usual opening at the top.

The following is an exact account of the state in which the roots were found of an unhappy Vine, which had been able to linger through several years in one of these contrivances, pulled down a few weeks ago. "This Vine, which was planted inside the pillar amongst a composition of lime rubbish, brickbats, charcoal, bones, and urine, had almost all its roots rambling up *the centre of the compost to the height of upwards of 4 feet, where they branched out in all directions very freely.* Some of them had their extremities turned a few inches in a downward direction; but most of the *lateral roots growing horizontally below 2 feet high* were either dead or in a sickly condition. The roots seemed to have fed freely on charcoal, but not to such a degree as on bones; one instance was found where two or three spongelets had penetrated into a piece of lime rubbish, but they were sickly; in another instance, a root 6 inches long had a few spongelets fixed to the lime belonging to the building, and had there died."

If any correspondent has a wish to draw any *practical inferences* from these facts we should be very glad to receive them.

COVERING AND SUMMER MANAGEMENT OF WALL FRUITS.

OF all the seasons it has been my lot to witness, this spring has been the most unusual. Our February, termed of old "fill dyke," was notorious for dryness; and soils in most parts might be as easily worked as they usually can be in an arid March. The temperature too has been, on the whole, very mild, with the exception of the last week of March, when a thermometer 16° below freezing point reminded folks of the old proverb, "All is not gold that glitters."

My purpose in making these remarks is to draw attention to the subject of covering fruit trees, and also to offer some suggestions as to the summer management of those, especially, which have missed a crop; and such will, I fear, prove a fearful majority. For my own part, I have for years been an advocate for some kind of covering, having so repeatedly witnessed the benefits to be derived from it; and it does appear an extraordinary thing that any man, in his sound senses, should object to even a mat being hung over his pet Apricot on a frosty night; and, not to go to extremes in the argument, say, with a thermometer 8° or 10° below freezing point—by no means an unusual affair.

But, says the non-protection advocate, "I do not like covering, for it has a tendency to 'draw' the buds." It may certainly do this when coverings of very close materials are used; but, for my part, I have never seen anything worth recording in this way, and I have used covering extensively for at least 20 years. On the contrary, such things as thin canvas, Spruce Fir boughs, &c., most decidedly retard the buds; for this reason I endeavour to get my trees covered at the end of February, drawing it off, if moveable, on all cold and windy days, and keeping close covered on those which are sunny or exciting.

My Peaches are now in full blossom or nearly so, and a finer sight in the Peach or Nectarine way I have never seen, and probably never shall see. The frost, to all appearance, does not seem to have affected them in the least. I need not inform the readers of the *Chronicle* that we do not possess a Devonshire climate in Cheshire; but I may add that these remarks, concerning the Peaches and Nectarines blossoming, are made in the month of April. I doubt much if the majority of those, not treated on the retarding principle, have not attempted to blossom long since.

It is only a few days since, that I read in a contemporary paper some notes on the recent severe frost, in which the writer says that the destruction of Peaches, &c., is unparalleled, every branch being encased in frozen snow. Now the question immediately arises, is such obliged to be the case; and would the preventing such an occurrence tend to insure a crop? Everybody must surely admit that he whose Peaches or other fruits—be they what they may—blossom a week or two later than his neighbours, has a superior chance in the majority of seasons, although perhaps the gardens join each other.

I much fear that in the heat of the controversy which has long raged between parties about this matter, the great principle of timely retarding has been lost sight of. Every gardener must know how exciting the sunshine sometimes is on a south wall, especially even in the end of February,—when on the heels of frosty or cold weather the blossom buds, with a change of atmosphere and intense sunshine, begin to unfold with a dangerous rapidity. Most, too, are aware that some plants—not indigenous—of a highly excitable character as to their foliation, frequently succeed better in a cold aspect than in a warm one. Here, then, is the principle of retarding, to which I would direct attention, only a stronger case still presents itself with regard to the south wall.

I would now respectfully offer a little advice on the summer management of wall fruits, more especially the Peach and Nectarine; for although the culture of the latter has advanced in some degree, yet we do not generally see them perfectly satisfactory. This is, I conceive, in part owing to the neglect of careful summer dressing. Many omit the stopping of gross shoots, termed "robbers;" many more leave too much of the annual spray on their trees; the sure consequence of which is imperfectly formed blossom buds, many of which become either absolutely barren, or produce diminutive fruits. It ought to be taken as a maxim by the careful Peach dresser, not to leave a single young shoot on the trees at the final disbudding, for which a reason does not exist. This may appear hard doctrine to those accustomed to leave them somewhat at random, which indeed too many are compelled to do, through the want of a sufficient staff of the right sort of labourers; still we must not confound principles with mere expedients; my advice is offered to those who are more fortunately situated.

Disbudding should extend over a period of some three weeks or a month; and once a week during that period will set all right. In the first disbudding, the more foreright shoots, and those jammed in, should be removed; in addition to these, the shoots which compete with the leader should be rubbed away, and also any rival shoots at the lower part of each "fork," where an experienced Peach dresser will always direct his special attention, for it is of the greatest import that the very lowest situated healthy young shoot should be preserved. This secures that succession of wood which keeps up the future fabric of the tree. And what is said of the lowest fork (by which latter term I mean the angle necessarily formed by the divergence of any two branches), is equally true of all the other forks or angles all over the tree. The securing a nice young shoot annually at this point being a guarantee against a lot of half denuded branches, which, whatever fruit they may bear on their extremities, can never be perfectly satisfactory.

Equal in importance to proper disbudding is the timely stopping or pinching of all gross shoots, which may be readily distinguished for ordinary wood, by their speedy tendency to produce side spray, almost coeval with the extension of the growing point. These have (as may be guessed by the most inexperienced) a continual tendency to attract an undue proportion of the sap; and if left unmolested, or merely pruned in the "rest season," they will assuredly become dangerous monopolists, and naked portions of walling will be the sure consequence.

The best practice, therefore, is to continue pinching off the heads of such, as long as they continue to appear. To be sure exceptions will arise at times, such as in the case of young trees required to fill a given space as speedily as possible, and which have not as yet begun to bear. In such cases they may be allowed to ramble a foot or more in length during the early part of the summer; still, I am not assured that any very great benefits are derivable; a little off-hand appearance is perhaps the chief.

Another point of paramount importance is freedom from insects; so important, indeed, that it is impossible to excel, and indeed difficult long to sustain the vitality of the trees, if such be permitted to infest them unmolested. A thorough syringing two consecutive evenings with tobacco water, and sulphur daubed as paint between the branches in April, have given me an immunity from the aphides and the red spider for some years. Blister on the leaves and gum on the wood is, I may say, almost totally unknown with me, as to outdoor Peaches and Nectarines; and this I attribute in the main to a soil comparatively shallow.

Summer disbudding and dressing is of nearly equal importance to our other fruits. A timely attention to this is indeed one of the prime secrets of successful cultivation, especially to trees on walls and under trellis culture. The artificial twisting and bending of the leaders causes them at all times to produce a host of spray, not eligible to the purpose in hand, for Nature abhors what we so much admire—systematic training. We try to make neat and prim bushes, Nature is ever attempting to make them trees. We are ever trying to increase the amount of succulency and richness of the pulp, Nature merely aims at perfecting the seed; thus a continual warfare is waged, and when true science is brought to bear, a knowledge based on a thorough appreciation of the character and habits of the tree, its mode of growth, and its root action, together with a just estimate of the character of soils, man comes off the conqueror; but he can only continue to hold his conquest by the most indomitable perseverance.

I had intended to offer some further remarks on other matters connected with our wall fruits, but must trust to another opportunity. In the meantime I would advise those who happen to be disappointed in a crop, after much expense and labour, by no means to despair. Other and genial seasons are doubtless in store; and indeed if these mishaps did not occur, fruits would be lightly esteemed, and our enjoyment of them consequently lessened. The commercial gardener is most to be pitied, for his very existence depends on success in such things. *Robert Errington, Oulton Park.*

VILLA AND SUBURBAN GARDENING.

THE cultivation of the Pelargonium, like that of most other inhabitants of the greenhouse, has undergone a remarkable change during these last 10 years. Enormous plants, with hundreds of stakes to support their flowers, have been produced; but these gaudy mountains of artificial gardening are anything but suitable for places of limited accommodation, such as those which amateurs generally possess. A few plants monopolise a whole house, and divest it of that variety which is the parent of interest, and which constitutes, or rather ought to constitute, the chief feature of a place of circumscribed means. In running away from the foreigner, who clings with considerable tenacity to his 3 and 4-inch pots, we have arrived at tubs, to the exclusion of good taste. I would prefer the "happy medium." Pelargoniums can be well flowered in what are known in the potteries as large 32's, or 6-inch pots; and if they are "well done" in pots of this size, they will produce as a whole a much more effective display, and they can be easily moved if required for house or window decoration.

The art of producing a lengthened bloom is well worth the attention of the villa gardener, and nothing is more simple. Place those plants which flower earliest under a wall, and fully exposed to the sun's influence, in order that the succulent wood may be well and early ripened; when this is effected, cut them down to within 4 inches of the pots; remove them to a rather close frame until they begin to break, when air may gradually be given them; eventually the lights may be taken off, in order that the young shoots may be hardened and strengthened, previous to the plants being placed in their winter quarters. By having a succession of plants so treated, a prolongation of bloom is readily obtained.

One of the main points in the culture of the Pelargonium is keeping the plants near the glass, and sufficiently far apart to prevent the foliage of one touching that of another. Give abundance of air in mild weather, and allow it to circulate freely amongst the plants. This will check their tendency to get leggy. Good loamy soil, moderately rich, suits the Pelargonium perfectly; for liquid manure can be readily administered in spring when it is growing rapidly. Plants treated in this manner will require very little staking. Perfect cultivation, in my opinion, consists in having a specimen well bloomed without being supported by a faggot of stakes. *Pharo.*

DISEASES OF PLANTS.

(*Continued from p. 244.*)

GENUS XIII. LACERATION.—I give this name to the injury caused to a plant when in removing any part of it the adjoining fibres are more or less disorganised, as when a branch is cut off with a saw, or eaten off by some animals who tear the shoots off. Some, it is true, crop off without tearing much. So the horse, the ox, the ass, and the mule, furnished with incisive teeth on both jaws, do not do near so much mischief as sheep and goats. The latter having incisive teeth on one jaw only, are obliged not only to cut but to compress, and this double action lacerates the plant. And as I have mentioned goats, this is the place to refute the prevailing idea, that the great injury done by goats to Vines and to trees arises from some peculiar malignant humour supposed to proceed from their saliva; the fact is that it is laceration alone that causes the bite of sheep and goats to be so much more injurious than that of other animals; and goats with their bold, greedy, and active dispositions are on that account so much more mischievous than the slow timid sheep. When a plant has been so eaten down by goats as to occasion fears that it will remain stunted and barren, if it be properly pruned down it will shoot out again, so as in progress of time to efface all traces of injury. It is to the neglect of the plants after the injury, not to the fabulous malignant humour, that the loss of so many plants eaten down by goats is to be attributed.

The greatest number of lacerations of trees or herbs is due to the numerous tribes of insects. I shall in an appendix treat of the evils they entail on vegetation. I shall now confine myself to the remark that sometimes herbs especially will often perish in a very short time from this cause. The prevention of the evil is very difficult, although in many cases when the decay of a plant is suspected to be owing to the presence of an insect, and it may be found on inspection on the plant or on its roots, it may suffice to expel the enemy and prune out the injured parts, to stop the injurious consequences of the laceration.

Obliged as we often are to use the saw, it cannot be too strongly recommended to use that kind of saw which will produce the least laceration, and after the branch is cut off to pare off with a sharp knife all loose fibres, and smooth off the surface left rough by the saw.

Genus XIV. Puncture.—This is a small hole made by a sharp instrument of small size, whether it be an awl or the sting of an insect. The amount of injury done will depend on the size of the hole in relation to the part affected. A needle passed through a leaf or a petal may be a matter of indifference, but if pierced into an ovary or a stigma it will prevent fecundation. Insects, as we shall see, are the great cause of mischief under this head.

Genus XV. Intrusion.—This is a class of injuries brought about almost exclusively by the work of insects. They pierce or divide some part of the plant, inserting into it some extraneous body, such as an egg. Sometimes a mere aperture in the bark, with the insertion of the extraneous body, arrests the flow of the sap, and causes a monstrous excrescence. Thus the Livia juncorum *Latr.* lays its eggs in the germ of the Juncus articulatus *L.* at the moment of the opening of the flower, causing it to acquire three or four times its natural size. This monstrosity is often accompanied by an elongation of the extremities of the calyx, which become covered with beards or awns. I once received a specimen of a singularly deformed piece of Elm wood. There was a little stone in the interior, which appeared to have been the cause of the monstrous conformation, although I was unable positively to ascertain it.

Home Correspondence.

Ripe Vegetable Marrows.—After two winters' trial of ripe Vegetable Marrow as food, having used it with all sorts of meat, I can confidently recommend it as a first-rate winter vegetable. Many object to eat it in a ripe state, and it may be many years before it receives universal acceptance as a winter vegetable, but in this it only shares the fate of many other things now common on our dinner tables. The Potato passed through the same ordeal; many a weary day did this valuable tuber struggle for a place. With almost, if not quite as many good qualities as the Potato, the Marrow is not so liable to so many diseases, and it is much easier to cultivate. Since I have recommended its use in a ripe state to public favour I have had letters from gentlemen who have been in every part of the globe, and they state that in some places hardly any winter vegetable could be obtained but ripe Marrows. Sir Henry Bethune informs me, that when in Persia, 15 years ago, Marrows or Gourds were his greatest favourites, but he never could get them into use at home. I have ripened the Marrow upon the flat surface of the ground for these two years past, as well as on iron rods, up sticks, over hurdles, against walls, and over arbours, which it shades agreeably. Indeed it may be grown in any place, and anywhere in the United Kingdom. It might be cultivated in Ireland with advantage; and till the people throw off their prejudices, pigs could be fed on it. They thrive fast upon it boiled and mixed with middlings, or other spare food. The seed should be sown, near London, about the first of April, in any warm corner; northwards, a little later would answer better. When up, plant out amongst Potatoes or other vegetables that are soon to be removed. As soon as it comes into bearing the fruit must be cut off regularly; the plants should not be allowed to bear the main crop until they are very strong. While they are acquiring strength the young Marrows could be used for table, as well as for mixing with pigs' food. The Vegetable Marrow likes a rich soil, and if it can be watered with rich manure-water now and then, so much the better as to its keeping properties; of course much will depend upon its ripeness. When thoroughly ripe the skin is very hard; if a pin pierces the skin freely it is not quite ripe. I have grown two sorts—a yellow and a green striped with yellow; both are well-flavoured and productive, but I prefer the green one. When ripe they must be stored in a dry place, from which frost is excluded. The under-ripened ones should be used first. In boiling ripe Marrows cut them up into pieces of 4 or 5 inches in length; take out the pith and seeds, but do not remove the skin before boiling; then boil in plenty of water with a little salt; after three quarters of an hour's sharp boiling (this depends upon its ripeness) let the pulp be scraped out into a dish, and press out all the water that it has imbibed during the process of boiling; add pepper and salt, and mash as with Turnips; and no one who has not tried it can have any idea what a fine winter dish it makes. To captains going long voyages it would prove most valuable. Vegetable Marrow in its young state makes a famous pickle. Cut it into 2 or 3 inches in lengths, as Cucumbers are served. I have several ripe ones now, April 15, quite sound, and their flavour is quite as good, if not better than it was in the beginning of the winter; with a little sugar it makes a good dish for children; and where Apples are scarce, good sauce for pork and geese, with a squeeze of Lemon in it; but always bear in mind that vegetables are made indigestible by too little boiling. *James Cuthill, Camberwell.*

Gardens on Burning Coal-beds.—As illustrative of the subject of your two leading articles at pp. 195 and 227, I send a free translation of a passage in Prof. Leonhard's "Naturgeschichte der Erde" (1te Ausg. 1ter B. s. 434). The author is treating of coal-beds on fire. "In Staffordshire, a garden of considerable extent is situated over one of these subterraneous conflagrations; its produce comes so rapidly to perfection that three crops are harvested within the year. Young exotic trees were planted over burning coal beds in another part of England; they grew vigorously, but, on attempting to shift them from the heated soil to another situation, soon died. At Planitz, near Zwickau, hotbeds have been placed, since 1837, along the lines where these natural furnaces approach the surface of the ground, and by means of this unpaid for, but nevertheless expensive, fuel, the plants flourish admirably." I have sought in vain for the sources of Prof. Leonhard's information regarding the English localities, but hope you will discover them, and further elucidate this interesting branch of the subject. *A. R., Woodside Cottage, Elgin.*

Visit to Mr. Low's Nursery at Clapton.—Mr. Low having been for some time a successful importer of plants from almost every quarter, I do not know a nursery where a person beginning to collect Orchidaceous plants is more likely to find specimens that he may want, and at a reasonable rate. There was not, however, much in flower, most of the plants being at rest; but for the collector this is an advantage, as the plants are in the best state for travelling. I however observed a magnificent Cyrtopodium marked splendens in flower, a long spike of deep yellow blossoms. Amongst his other stock was the new Viburnum suspensum, in flower, which Mr. Low considers will be hardy, the flowers something like Hoya bella, sweet; the foliage evergreen and very handsome. There are also fine Cephalotaxuses from Japan, introduced by Siebold, of Leyden, which if hardy will be a great addition to the Coniferæ; and particularly there has been raised a good stock of the Thuja chilensis, which if it prove hardy will be an acquisition to our trees; two were raised by Mr. Low in 1847, and one of them is at Elvaston Castle. The stock of Australian plants appeared good. *Dodman.*

Destruction of Slugs, Snails, and Wireworms.—Having suffered very much in my garden from the depredations of these vermin, I have been induced to try the effect of Swede Turnips as a decoy for them. I had a large basketful cut up into slices rather more than half an inch in thickness, and placed about my garden (about a quarter of an acre), and the result of 10 consecutive days' operations, is the securing of the enormous quantity of 9096, besides a great quantity of wireworms and milipedes. The second morning's collection was 2056 slugs and snails; 510 is the smallest collection I have made. The Turnip slices I have been using are now put into the ground edgeways, the better to trap the wireworms, and I am employing fresh slices for a further destruction of slugs and snails. *Thomas Colley, Ipplepen, Devon.*

Would Guano benefit American plants, such as Rhododendrons of all kinds, and Azaleas? *C. H.* [Has any one tried guano for such plants?]

Uniting Bees.—In my observations (p. 534, 1849) on uniting bees, I stated that I had succeeded, by a method accidentally discovered by myself, and new to me, in uniting the bees of two hives which I had rescued from destruction, viz., by driving them into an empty hive together (without having recourse to fumigation) one evening, and transferring them to one of a set of boxes on Nutt's principle in the afternoon of the following day. I stated also my belief that the plan would succeed under any circumstance of uniting bees, and advised your correspondent "W. G." to try it in the instance of it strengthening a weak stock. I can now back my advice by my own experience, having strengthened one of my own stocks, by the addition to it of the bees out of two others within the last few days. The plan adopted was similar in most respects to that described by me before. The bees were driven from all three stocks one after another into an empty hive, and when united were driven back the same evening into the stock which I desired to strengthen, and from which part of them had been driven before. The whole process of four drivings consumed exactly two hours, at the end of which time the strengthened stock was quietly standing on its old pedestal, as if nothing had happened. As this stock was a common cottage hive, the whole business was accomplished the same evening, which could not have been the case had it been a box hive. This can only be done by daylight (in the hot sun if possible, and after the usual swarming time of day is over), owing to the difficulty—I may say impossibility—of driving from a circular to a square hive. Not even with the assistance of a board intervening between the hives, with a hole in its centre of the same size as the box, can the thing be done; because in nine cases out of ten, if there be not a clear, uninterrupted ascent from one hive to the other, no degree of force or persuasion will induce the bees to mount beyond the obstruction. From this it will be understood that the hives to be operated upon should be as nearly as possible of the same size. I would observe that I drove the bees out of the stock to be strengthened, because without fumigation I think they would have resented the intrusion of strange bees; and I drove them first, in order that they might have time to forget their old home, and might thus be on the same footing as the others to be joined to them. While on the subject of bees, I would inquire what is the best food for them? As I am rearing a stock entirely by artificial means, I am anxious to combine the best method of feeding with the greatest economy. For some time I tried the following compound, recommended by Mr. Golding, of Maidstone. In one quart of beer was melted one pound of rich, brown sugar, to which was added ½ lb. of honey and a dessert-spoonful of rum and sherry in equal quantities, and a small quantity of salt. This, however, the bees did not particularly relish, and it went but slowly; moreover, after some time it turned sour in the zinc feeder. Would this be the case after absorption and its transfer to the cells, or would it keep in the hive good and wholesome till the spring? If so, being the cheapest food, and as the bees will eat it, it will do well enough. I have however concocted a liquid which they devour greedily, make the whitest comb of it, and thrive amazingly upon it. They have consumed in three weeks 1½ gallon of it, worth 8*s.*, and have constructed seven large combs which half fill the box and more, and many thousand cells are sealed up already. It is this: 4 lbs. of rich Barbadoes sugar, boiled for a few seconds in a quart of beer, to which is added 2 lbs. of honey, a glass of sherry, and a spoonful of salt. *P. V. M. F.*

The "Physicky" Taste in Rhubarb, of which your correspondent complains, is caused by frost; a considerable quantity of the early Albert Rhubarb was sent into market after having been touched by the frost, and was worthless, although, to all appearance, it was tolerably sound. Tarts made of such Rhubarb have been consigned to the pigs, on account of the physicky taste they possessed. We are great Rhubarb consumers here, no season being without one or two substantial pies, which if properly made are delicious; and I have never known the flavour of fresh pulled Rhubarb vary unless it was caused by frost, *i. e.* Rhubarb of the same species. No kind equals the Victoria in flavour; and now that it is in fine order, and selling in the markets at a reduction of one-third the price of last year, it will, no doubt, be more extensively used. The stalks should not be washed, but simply rubbed with a cloth, and cut into pieces of 1 or 2 inches square, without any scraping. I mention this, because I find that pie at home and pie abroad, are very different things. Washing the stalks makes the fruit flavourless, and to remove the outside deprives them of the rich crimson tint which well-grown Rhubarb should possess. *H. T. P., Greenwich.*—According to my experience the "physicky" taste in Rhubarb comes on in dry weather and goes off in wet. If I am correct, copious watering would be the remedy. *B. B. B.*

The Salad Ground near Erfurt, alluded to at p. 245, as yielding a profit of 12,000*l.* per annum, was, when I made a tour through Germany, in 1846, wholly devoted to the culture of the common Watercress (Nasturtium officinale). We are informed by "Rhind's Vegetable Kingdom," page 300, that Watercresses were first cultivated in Europe at Erfurt; and that its cultivation is still conducted extensively there, will be readilly inferred, when I mention that the markets of the greater portion of Germany derive their supply of it from this source. I visited Erfurt in February, and even at this (for central Germany), very early season, I observed that the Watercress, in consequence of the natural warmth of the spring from whence the "Salad-ground" was irrigated, was already being collected for the markets. From the great extent of ground under Watercress cultivation at Erfurt, and from information obtained on the spot, respecting the profits derived therefrom by the proprietors, I unhesitatingly assert that the amount of revenue alluded to by Professor Ansted, though great, is far from being exaggerated, as "A. C." seems inclined to suppose. *Theodore Baubin, Chatsworth.*

Rose Stocks.—In an article on Rose stocks which appeared in your Paper of March 23, Mr. Saul, of Durdham Down Nursery, says, that the kind of stock on which Roses is worked is a point of no little importance. I would add that another and still more important item, as respects successful Rose growing, is to secure a permanent union between the scion and stock, by which the new plant may grow as freely and as long as it would have done on its own bottom under the most favourable circumstances. If this is not attended to, the hopes of the cultivator will be frustrated by the early death of his plants. Mr. Saul states that many cultivators use strong vigorous stocks, such as crimson Boursault, Celine, and others. I never heard of the crimson Boursault being employed as a stock. It sells well itself. The blush Boursault is used for that purpose, and to a great extent in many, indeed I may say in all nurseries; but it is not suitable for weak growing Roses. Celine answers well for such kinds as Hybrid Chinas; but it is only fit for dwarfs. Sir Walter Scott makes a fine stock for Noisettes, such as Cloth of Gold, Solfaterre, Eclair de Jupiter, Ophirie, Vicomtesse d'Avesne, Zietrude, &c., worked in the autumn, and taken up and potted, these will be found to flower freely on this stock in the following spring. It will be found that the head and the stock will grow and swell together to a large size. This stock will grow freely in any light soil, where the Briar becomes covered with moss, and dies. The old Maiden's Blush makes a stock second to none for working Tea-scented Roses on. I have also worked with success the three following Noisettes on it, standard high: Clara Wendell, Mrs. Siddons, and Smith's Yellow. Their growth is fully double that of the same kinds on Briars. The blush Boursault answers well for the strong-growing hybrids; Coupe d' Hébé, Chenédolé, Fulgens, Brennus, Blairii, Paul Perras, Paul Ricaut, and many others of similar habit, and they will last on it for a number of years. I may say as long as on the Briar, or on any other stock, and the growth and blooms are finer. That the Manettii is a good stock no one will venture to deny, but it is not better than the old Maiden's

Blush, except that it strikes much more freely. The Briar makes the best stock for most Moss Roses, as well as for the Austrian and Sweetbriars, and their hybrids. *H. Coppin, Mr. Clarke's Nursery, Streatham-place, Brixton-hill, Surrey.* —— My experience is totally irreconcilable with Mr. Saul's statements respecting the merits of the different kinds of Rose stocks. In recommending the Manettii, Mr. Saul says that "Teas and Chinas will grow better, and live much longer upon it, than on either the crimson Boursault or Celine." Now I happen to have living proofs in plants of these kinds (many of which trees are as many years old as the Manettii stock has been known in England), that the Boursault and Celine are equal to any stocks, for these Roses, that have yet been discovered. The Safrano, Elise Sauvage, Yellow China, Comte de Paris, Devoniensis, and others, I have now, not only not showing any symptoms of decay, but actually increasing in strength and bulk of head after the lapse of years. One plant of Elise Sauvage, on the Celine, is a very remarkable instance of this, having become a strong bushy plant from a very weakly first shoot; the manner in which it grew after the heading back in the first year was astonishing. Other kinds on both the Celine and Boursault have thriven equally well; but I notice this, as the Elise Sauvage is so delicate a Rose as to be liable, more particularly than many others, to the danger described by Mr. Saul, were such danger to be generally apprehended. Add to these instances before my eyes, the well known circumstances of the finest Cloth of Gold and Devoniensis in the kingdom being on the Celine and crimson Boursault stocks, and must we not have strong doubts of the correctness of Mr. Saul's judgment on this point of Rose-growing? I think it most probable that Mr. Saul's mistake in the matter arose from his working on Boursault stocks, raised from thick, sappy, instead of small, hard cuttings. Let him grow his stocks from the latter, and he will at once be satisfied that they become harder and less subject to decay, than the Manettii, which, however, Mr. Rivers's specimen fully establishes as an excellent stock, and the real merits of which I would in no way depreciate, excepting so far as I am compelled by the comparison between it and other stocks, instituted by Mr. Saul. *An Amateur, Bristol.*

Rotting of the Flowers of the Double White Brugmansia before they expand.—I have a double white Brugmansia which does not flower properly under my management, though the plant from which it was struck flowered most freely and healthily in a Vinery. Last year my plant was grown in a pot in a Vinery, when it appeared healthy, but each flower, as it appeared, began to rot off in the centre before the double part expanded. As I had a single white Brugmansia which flowered most luxuriantly when plunged in a border in the greenhouse, I turned the double one also out of the pot and plunged it where it had plenty of room for its roots, but to my disappointment its flower here was even worse than before. We have, at different times, tried much watering and little watering, but the result and disappointment are the same. The centre, which ought to form the double flower, is always decayed before it expands properly. Can any of your correspondents inform me whether this disease is common to the plant, and what mode of culture would remedy it? We grow it in a very rich, loamy soil, and it appears most luxuriant and healthy. *Lancastria.*

Curious Species of Cress mentioned by Chateaubriand.—In the English translation of that delightful work of Chateaubriand's, "The Genius of Christianity," by Shoberl, with preface and notes by the Rev. H. Kett, at page 183, vol. i., occurs the following paragraph: "On the banks of the Yare, a small river in the county of Suffolk, we were shown a very curious species of Cress; it changes its place, and advances as it were by leaps and bounds. From its summit descend several fibres; when those which happen to be at one extremity of the plant are of sufficient length to reach the bottom of the water, they take root. Drawn away by the action of the plant, which settles upon its new root, the claws on the contrary side loose their hold, and the tuft of Cresses turning on its pivot moves the whole length of its bed. In vain you seek the plant on the morrow in the place where you left it on the preceding night, and you perceive it higher up or lower down the current of the river, producing, with the other aquatic families, new effects and new beauties." It has sadly puzzled me to guess what little Crucifer this can be, and I have often felt inclined to come to the uncharitable conclusion that it lived but in "the poet's dreams." Perhaps some of your correspondents may be able to throw some light on the subject. I would also feel thankful if the writer of the notice of "the Mistletoe growing on the Oak," or any other correspondent, would confirm his curious statement "that the Mosses (does he mean by these the true Mosses or Lichens, or both?) that grow on Quercus pedunculata are different from those on Q. sessiliflora," and *vice versa*; and if so, to give the names of the species peculiar to each. The fact stated is a curious one, but requires to be confirmed; the more so as the writer tells us the branches of the two varieties of Oak were so close as to intermingle. *A. B., March* 5. [One part of this communication is quite as much in need of confirmation as the other.]

Lamp-Black is, I believe, the very best material to mix with oil as a protective paint for any surface exposed to the action of the weather. In proof of this, it is only necessary to examine the condition of any old notice board which has been painted in the usual manner with black letters on a white-lead ground. In many instances I have found that the black letters remain perfectly distinct long after the white-lead ground has perished and been dissolved, excepting where it has been protected by the thin film of carbonaceous covering formed by the black letters. I have an instance at hand, in which the black letters stand out in clear relief or projection, in consequence of the perishing of the surface of the wood, as well as the solution of the white-lead paint which originally covered it. This is no more than might have been expected from the well-known action of lead on oils, which has the effect of destroying the elasticity and toughness of the oil to such an extent as eventually to render it as brittle as glass, and also of converting it into a kind of soap of slow but certain solubility. Lamp-black being one of the most unchangeable substances in nature, excepting by actual ignition, it neither acts nor is acted upon by the oil, and its particles are too fine to have any injurious mechanical influence. Next in value to lamp-black I would rank finely ground anthracite. *J. Howard.*

Feeding Bees.—"Y." may rest assured that there are apiarians on the north side of the Tweed as well as on the south who know the good effects at times of closing the doorways of beehives (except air-holes), whatever he may state to the contrary. When bees are fed from proper feeding-pans at the top of the hives there is no occasion for the careful removal of what is left next day, nor perhaps for closing the doors; but the case is widely different when they are fed below, whether by night or by day. Although "Y" objects to a little feeding during the time bees sun themselves, there are apiarians who approve of it, especially when there are no strange bees kept within range of their short flight. This does not coincide with Mr. Golding's brief notice of feeding; but I may remind him, when bees require feeding in spring they may starve before the gloamings are warm enough to admit of their having a short flight before they go to rest; and when they do, the bees in the same apiary would soon be aroused by their hum, which sounds as if they were after plunder. If "Y." thinks his the best plan, why not mention it in his book on bees? [What book on bees? Our friend "Y." never wrote a book on the subject; but he has read a good many—the value of which his long experience does not place very high] I have now only to observe that I am better acquainted with the good effects of salt on Asparagus and Seakale beds than on bees; not that I am ignorant of what has been said both *pro et con* as a medicine for them, particularly at the breeding season, a term, however, not well defined by some writers, which might lead "Y." to recommend withholding water from his salt-pans after May. *A Peebles Apiarian.*

Garden Walks.—It is agreed on all hands that some degree of convexity is necessary, in order to throw the water to the sides; and yet the less a walk is rounded the more comfortable it is to the foot. It too often happens that, when there is any degree of declivity in the ground, the walks, on account of the raised edges (if in Grass), become water-courses during heavy rains, and I have often seen the gravel washed up and carried before the stream, and the walks so injured and disfigured that it required much labour and trouble to get them right again. To prevent such unfortunate occurrences, it has been my practice, on many occasions, to carry a drain along the line of the walk (whether on one side or in the middle is immaterial), and to place gratings at the edges at such distances, or in such positions, as to carry the water into the drain before it accumulates into such a body as to furrow up the gravel; or, in some instances, where the cast of the ground or local circumstances will admit of it, I make outlets and let the water run off. These things attended to, it is of less consequence of what material the bottoming of the walk consists, provided it is coarse and dry, with sufficient thickness of fine gravel above it, to admit of occasional turning. Upon the whole, there can be no fixed rule for walk-making, as so much depends upon local circumstances. The end to be kept in view—a dry, comfortable walk—and the means of attaining that end, must in a great measure depend on the sagacity and judgment of the gardener. *Quercus.*

Size of Mahogany Trees.—The following are the dimensions of a log of Mahogany said to be the largest ever imported into Liverpool. I measured it as it lay on the Birkenhead-quay. Its length was 20 feet, width 4 feet, depth 5 feet 4 inches. *J. W. H.*

Porous v. *Non-porous Pots* (see p. 228).—"G." says, "Most assuredly one of the conditions not essential to perfect plant growing is a porous pot." Now some may infer from this statement that the non-porous pot is superior to one that is porous for the perfect cultivation of plants. Has "G." ever observed, in a moist stove, pots of a dark dull invisible green, and as slippery as a slug on a spring morning? Has he ever seen the soil in such pots in as wet and sour a state as an undrained marsh? Has he ever seen the plants in such soil looking death-like and ghostly, with only the apology of a root? Has he ever had the pleasure of continually washing, rubbing, and scrubbing such pots for the purpose of seeing their original colour even for a week or so? On the contrary, Has he ever seen the London-made porous pots, maintaining their colour without any cleaning whatever, and their occupants in a healthy and flourishing condition? If he has not witnessed these things, then he is unacquainted with what a non-porous pot is, and shall have to enjoy the satisfaction of practically proving the matter, as I have done. If I was going to grow a plant in perfection, I would certainly employ the porous pot. "G." says, "once let a pot-bound Erica or Epacris become thoroughly exhausted of moisture, and it becomes almost impossible to induce water to re-saturate the mass." Now, if he was thoroughly acquainted with the perfect cultivation of either the Erica or the Epacris, he would never allow them to become dried in the manner he describes through inattention to watering. Any one well versed in their culture would never allow them to become either wet or dry, but would endeavour to keep them in a medium state as regards moisture, and that cannot be done except by using the porous pot, and by paying proper attention to drainage and watering. Does the advantage of the non-porous pot consist in its keeping the plant continually moist? Suppose that one person washes himself thoroughly, and keeps the pores of his body clear for free perspiration, and another never washes himself at all, but suffers the pores to become choked up, which would be the healthiest man? Certainly he who kept the pores clear; and the same holds good as regards the pots in question. But suppose plants in each description of pot were to become saturated with water, which would be likely to suffer the most? Those in the non-porous pots, as a matter of course. Did "G." ever turn out of either kind of pot the same sort of plants, and examine the state of their roots? if he has not, I would recommend him to do so. In the porous pot he will find the roots strong and healthy, clinging to the sides of the earthenware, while the roots in the non-porous pots will be found to be weak and away from the pot, showing at once which material they prefer. But "G." says, "I would still employ the same material, mechanically speaking, but I would coat the exterior with a dense glaze, and also the interior of the pot for an inch or two from the surface of the rim." Now, why only glaze the outside? surely something must have struck "G." that he would like to have porous glazed pots. If he would glaze the outside, and the inside partly, why not glaze the pot all over? Does he suppose that it would be porous inside and not porous outside? In the matter of colouring, I agree with "G.," but they must be coloured with something that will not interfere with the porosity of the material. *F.*

Societies.

Botanical of Edinburgh, *April* 11.—Professor Fleming in the chair. Several donations were announced. Dr. Greville gave the following report on a specimen of fibrous matter from the Edinburgh Water Co.'s works, and a specimen resembling it, found on an old wheelbarrow in Dundee: "The fibrous substance from the Water-works, is Ozonium auricomum of Link. Along with a number of other fibrous and byssoid productions, it is now regarded as either an imperfectly developed or aberrant form of some fungus. Ozonium, Himantia, Fibrillaria, Acrothamnium, Byssocladium, &c., are considered by Fries as the Mycelia of Hymenomycetous fungi, in a more or less monstrous state. I am not aware that the full development has ever been traced, so that the species has not been identified. The specimens from an old wheelbarrow are probably the same thing. Having been more favourably placed, there is evidently an approach to a higher development." Mr. M'Nab showed a specimen of Ranunculus ficaria, raised from roots which had been gathered in Silesia by the Rev. Mr. Wade in 1848. These roots had been exposed over a large extent of country in Austria by heavy rains, and the common people gathered them and used them as an article of food. Their sudden appearance gave rise to various conjectures as to their nature and origin, and in the Austrian journals they were spoken of as if they had fallen from the sky. The small bodies were used as Peas by the inhabitants Mr. M'Nab had tasted the dried specimens as well as fresh roots of Ranunculus ficaria gathered in this country, which, after being boiled, he found very amylaceous. There is no acridity in the roots even in their fresh state. A paper was read on Indian Hemp (Cannabis indica), by A. Christison, Esq. On careful examination no specific differences could be detected between the specimens raised from Indian seeds, and the common Hemp in the garden. Mr. M'Nab read the following report on the flowering of the plants in the open borders of the Royal Botanic Garden, Edinburgh, in continuation of a similar report read at last meeting.

Date.	Lowest Point of Thermometer during the Night.	Names of Plants in Flower.
March 15	40°	Saxifraga oppositifolia, Adonis vernalis.
,, 16	37	Corydalis solida, C. cava.
,, 18	32	Muscari botryoides, Orobus vernus.
,, 19	35	Geum altaicum, Lamium maculatum, Tritonia media, Anemone nemorosa.
,, 20	37	Fritillaria imperialis, Gagea lutea, Saxifraga crassifolia.
,, 21	39	Primula auricula, P. marginata, Alopecurus nigricans, Corydalis capnoides, Aubrietia deltoidea.
,, 22	29	Saxifraga virginica, Geum pyrenaicum, Erigeron villosum, Primula villosa.
,, 24	23	Aubrietia grandiflora, Orobus venosus, Narcissus pseudo-Narcissus, N. moschatus.
,, 25	29	No plants observed in flower.
,, 26	26	Do. do.
,, 27	22	Omphalodes verna.
,, 28	25	No plants observed in flower.
,, 29	35	Do. do.
,, 30	37	Dalibarda geoides.
,, 31	38	No plants observed in flower.
April 1	42	Hesperis arabidifolia, Viola pulmonensis.
,, 2	44	Narcissus bicolor, N. incomparabilis, Pulmonaria angustifolia.
,, 3	45	Alyssum saxatile, A. montanum, A. appenninum, Orobus flaccidus, Pulmonaria virginica.
,, 4	44	Pulmonaria officinalis, Euphorbia pilosa, Cardamine bellidifolia, Draba rupestris, Hierochloe borealis.
,, 5	38	Asphodelus taurieus, Carex stenophylla, C. pilosa, Euphorbia epithymoides, Orobus canescens.
,, 6	39	Anemone hortensis, Narcissus stellaris, Doronicum Pardalianches, Prunus Cerasus.
,, 8	45	Scilla italica, Lunaria vesicaria, Hyacinthus orientalis.

Botanical of London, *April* 5.—G. Cooper, Esq., in the chair. A collection of dried specimens of the flowering plants and Ferns growing native within a district of the county of Norfolk, embracing an extent of about 40 square miles, having for its centre the tower

of Fakenham, was presented by W. S. Notcutt, Esq R. Hudson, Esq., F.R.S., &c., Dr. Caspary, W. H Purchas, Esq., and Mrs. L. Watkins, were elected members. A conclusion of Mr. Coleman's paper, "On the plants indigenous to the neighbourhood of Horsham, Sussex," was read.

April 24.—Meeting at Worton Cottage for the display of Seedling Florist Flowers, &c. — A beautiful evening and a nice display.—Mr. Coombs, of Northfleet, placed on the table three blooms of a pretty seedling Azalea indica, having a white ground colour, striped and spotted with deepish lilac.—From Mr. Strong came nine varieties of seedling Ericas, of 1850, raised from Aristata and Macnabiana. They were not sufficiently distinct to claim individual notice, although they had enlarged and purer lips, with brighter colours than their progenitors. They arrived in capital condition.—Many seedling Cinerarias were present. Mr. Salter, Versailles Nursery, Hammersmith, staged two plants, Clementine and Crimson King; the former a beautifully-formed variety, with obtuse petals, white ground, deep rosy-purple tip, good habit, and free bloomer, which may also be said of the latter, though we should call its colour a rosy-purple self, with neat, small disc.—Mr. Keynes, of Salisbury, brought a truss of a seedling very similar to Clementine.—Mr. E. G. Henderson had a quantity of blooms; three of a variety named Madame Sontag claimed much notice, possessing, as they did, every point of a good flower—small disc, broad obtuse petals, white ground, most delicately tipped with pale blue.— Mr. Layton had a well grown specimen of his Hammersmith Beauty, not yet sent out. In colour it is azure blue, with a light circle round the disc, which is somewhat large; altogether it is a striking variety, a profuse bloomer, and good in habit.—Seven varieties shown by J. C. took no place with those on the table; not one of them would bear describing.—Six varieties of seedling Mimulus, from Mr. Layton, of Hammersmith, were large and fine; one in particular, which Mr. Andrews was figuring, is a large flower 2 inches in diameter, of a rich yellow, margined with crimson maroon, and having a handsome blotch of the same colour on each petal; throat spotted. They were well-grown plants, with good foliage.—From Mr. F. Whitly came seedling Pansies: No. 38 had two decided shades of ground colour, which condemned what would otherwise be considered a first-rate flower; No. 6 was coarse and inferior; No. 1, good in quality, but too small to report upon. A seedling Polyanthus, "Richard Cobden," from the same grower, was wanting in the circular properties which a first-rate flower must possess.—W. A. sent a single pip of a semi-double Auricula, of a character well known to raisers, but not considered valuable. It was a grey-edge, with good paste, very circular, and had a second and smaller flower rising from its centre.—Mr. Turner was present with a flower of his Pansy, "Mr. Beck," in good character, from the open ground.—Mr. Gad, gr. to — Lennox, Esq., brought two plants of his seedling Petunia "Enchantress," and a cut branch covered with large well formed flowers, of a light character, delicately veined. — Two-year-old seedling Pelargoniums were on the table from the Worton Cottage collection; these we shall see again, and therefore shall not notice them till the season is more advanced.

Reviews.

An Encyclopædia of Gardening; comprising the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening; including all the latest Improvements, &c. By J. C. Loudon, F.L.S., H.S., &c. A new Edition, corrected and improved, by Mrs. Loudon. 8vo. Longmans, London.

We perceive, with much satisfaction, that a new edition of this standard work has been issued. It is undoubtedly the most useful of all books to a gardener; and that gardeners think so is abundantly proved by the many thousands of copies which have been sold. Even the first edition, with all its blemishes and grievous faults, was welcome; but they have been long since corrected, and in its improved state the work has found friends everywhere. We must allow Mrs. Loudon to describe the peculiarities of this new edition in her own words:

"The leading principle which she has adopted for her guide has been to make the work as nearly as she possibly could what she believes her late husband would have made it, had he lived to the present time. The general arrangement remains the same, as the experience of nearly 20 years has proved the justness of the author's sentiments on this subject, which he stated in the preface (given in pages v. and vi), which he prefixed to the third edition of the work. The execution of the work has been conducted on the same principles as those which guided Mr. Loudon himself; viz., those of inducing the young gardener to think for himself, and giving the man of experience a choice of practices. 'All knowledge,' observes Mr. Loudon, in the edition of 1834, 'to be really useful, must be gained by experience; and the next best thing to gaining this experience from personal practice is to observe and reflect on the practices of others.'

"Part I., containing the History of Gardening, has been carefully revised, and brought down to the present time. Part II., containing the Science of Gardening, has been completely rewritten; and the editor has to return thanks to Dr. Lindley for permission to make extracts from his valuable works on Vegetable Physiology, &c., particularly from the new edition of his 'Introduction to Botany.' She likewise offers her most sincere thanks for the very valuable assistance she has received in geology from Professor Ansted, and in chemistry from Professor Solly; these gentlemen having read over and corrected the articles on their respective subjects. The article on Entomology in this part has been entirely rewritten by J. O. Westwood, Esq. Part III., on Gardening as an Art and as practised in Britain, has received several valuable additions from Mr. Thompson, fruit gardener to the Horticultural Society of London, who has looked over and revised the lists of fruit and vegetables. Mrs. Loudon has also been very greatly indebted to Mr. Marnock, superintendent of the Royal Botanic Garden in the Regent's-park, for the plan and description of that garden; to Mr. Ogle, gardener to the Earl of Abergavenny, at Eridge Castle, for his drawings and description of a fruit-room, his mode of cultivating Pines, and many hints and corrections; to Mr. Francis Rauch (many years assistant to Mr. Loudon) for much valuable assistance, particularly in the catalogue of Coniferous trees, and in the tables containing lists of various kinds of flowering plants; and to Mr. David Wooster for the very great care and attention he has bestowed in assisting in the work in general, and particularly in the correction of the proof sheets. The subject of landscape-gardening has been considerably enlarged; numerous woodcuts have been added; and, in short, no pains have been spared to render this edition as perfect as possible."

Garden Memoranda.

Mr. Beck's, Worton Cottage, Isleworth.—A fine afternoon, and the certainty of a rich floral treat before us, induced us to pay a visit to this quiet and interesting place, which we reached in good time to see the seedling flowers which are exhibited here every Wednesday evening for the inspection of the censors of flowers sent for opinion to the superintendent of the "Florist." We found that ample accommodation had been provided for the display of such flowers which, away from smoky dusky London, are seen to great advantage. A span-roofed house, some 20 feet long, glazed in front, and having a convenient green baise covered stage, has been appropriated to the exhibition of seedlings, not only such as are sent for the opinion of the "Florist," though that is the main object for which these meetings have been instituted, but for all florist flowers, whether produced for the purpose of comparison or notice. When we state that these flowers receive the most careful examination from some of the best florists in the kingdom, comparing them at their leisure one with another, and then again with older flowers of acknowledged excellence, we need hardly say that raisers of seedlings must reap much benefit from such meetings. As will be seen from a report in another column, some good things were produced, and we are given to understand that the number of flowers of various kinds is increasing with every succeding meeting, a sure token that an interest has been excited in the matter. But we will take our readers through the plant houses, for that is a privilege freely granted to all who attend these meetings. The Pelargoniums for the May exhibition are coming very fast into bloom, and they promise to do good service. Their trusses, without being drawn, stand well up above the foliage, which is small—too small, according to the opinion of some, but Mr. Dobson well knows that large foliage and rampant shoots are incompatible with a fine display of blossoms. Indeed, so far from being drawn, the branches have few or no sticks to support them. The plants for the June and July shows are "stocky" and healthy. Two long houses are filled with this year's seedlings, from which, considering Mr. Beck's usual success, much may be expected. The small stove, which was wont to be filled with Orchids, is now occupied with Achimenes, Gloxinias, &c., of which there is here a nice collection, and the Orchids have been removed to what was formerly the Rose house; but Mr. Beck, after beating everybody, and being well beaten himself, has given up the pot culture of Roses The ever-flowering Phalænopsis amabilis was in bloom, and so were some other Orchids; but the lion of the collection was a magnificent Dendrobium nobile, about 4 feet high, and as much through, literally covered with flowers expanded and expanding. A seedling Geranium-house, parallel with the Orchid-house, claimed much attention. It was fitted up with a table in the middle covered with fine healthy plants, and surrounded with slate shelves, on which were two-year-old seedlings. Having passed through the potting shed, in which there is a place for everything and everything in its place, and round the end of the principal Geranium house we find ourselves among flower beds in gravel, with a broad walk before us leading to the little lawn near the house. This walk is broadly margined with Grass, and lined on either side with standard Roses, which rise out of small circles in the lawn. To improve the health and flowering of the plants, these circles receive a little dung in November, covering it slightly with soil, and in spring this is "pointed" in about the roots. The beds are edged with slate of an ornamental description, which, besides being impenetrable and offering no harbour for insects, contrasts admirably with the warm colour of the gravel on the one hand, and the soil and green leaves on the other. All the houses here are furnished with canvas shading, at 4½*d.* a yard, made to move up and down on rollers; and in the end of one house we observed one of Mr. Dromgole's ventilators in use. Haythorn's Hexagon Netting, a neat looking material, is employed to exclude bees, &c., which, when allowed admission, fertilise and spoil the Pelargonium flowers. We saw one of Brown's fumigators put in use for smoking a span-roofed house, 40 feet long by 12 feet wide, which it filled in from five to eight minutes. It was one of the largest size. It should be mentioned that in charging this kind of fumigator, instead of placing the hot cinders in the bottom of the receiver, as is usual with other fumigators, they should be put on the top. This is important, for otherwise it will not burn. In justice to Mr. Dobson, we must mention that the garden altogether exhibited the best of keeping; not a weed was to be seen, the walks were all neatly swept and rolled, the Grass cut short, and indeed everything and every place had that air of cleanliness about them which gives one pleasure to see, and in which consists the charm of a well kept garden. Those interested in the application of slate to horticultural purposes will find everything here in use which Mr. Beck recommends, such as tanks for rain and manure-water, shelves, tubs and boxes for plants, edgings for borders, hot water tank covers, floors for frames, &c. We had nearly forgotten to state that Mr. Beck has some nice plants of the Ceylon Anæctochilus, whose beautiful leaves are the admiration of everybody.

Miscellaneous.

Suggestion for a Metropolitan Winter Garden.—The "Westminster Review" proposes that the building to be provided for the Great Industrial Exhibition shall be of such a character as that after the Exhibition shall have closed, it may be used as "a great metropolitan conservatory, or winter garden." "Our parks are pleasant, and available for exercise during six months in the year, but scarcely for a longer period. The Duke of Devonshire, and a few other noblemen, have magnificent conservatories, in which, during the severest weather, they can enjoy a healthful promenade, and breathe the balmy air of summer. The public have only the conservatory at Kew, which is on too small a scale, and too far distant, for the multitudes who would visit it in the winter season, if in the immediate vicinity of London. Why should the inhabitants of the metropolis not be enabled to command, between the months of October and April of every year, the facilities a winter garden would afford for healthful enjoyment; and especially that large invalid class of our population whom the first breath of a north-easterly wind now consigns to the imprisonment of their own dwellings?" —*Economist.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Great care is necessary in watering newly potted plants, to prevent the fresh soil from becoming soddened and soured. When any plant is observed to be in this state, it should be shaken out, repotted in sweet soil, and more carefully watered for the future. But if this operation is to be of any service, it must be performed without delay, as the roots of plants are speedily injured and destroyed if allowed to remain in contact with unwholesome soil. Thunbergias, Clitorias, and other climbing tender annuals, should be transferred at once from 4-inch pots to those in which they are intended to flower, in order that they may at once be furnished with a suitable trellis; the soil for Thunbergias can scarcely be too rich. Ipomœas of the annual kinds should in like manner be grown on, without receiving any check. During the growth of these climbers some of the strongest shoots should occasionally be stopped, to induce the formation of laterals and to equalise the strength of the plants. Abundance of light is necessary, to prevent weak long-jointed shoots, and when their growth is nearly completed, and the plants begin to produce flower-buds, the amount of air should be considerably increased, in order to prepare them for the cooler atmosphere of the conservatory. Ipomœa Learii, and I. ficifolia, are excellently adapted for the autumn decoration of the conservatory; for this purpose they should be potted in 10 or 12-inch pots grown in stove heat till the end of May, and then removed to cooler quarters. The plants will flower more freely if they are kept in their pots, than they will if planted in the soil; but there is an advantage in setting the pots on the surface of the soil, and allowing the plants to root through, as they are thereby enabled to guard themselves against accidental drought, and the nutriment they derive by the same means contributes to maintain a healthy appearance to a later period, without interfering with the profusion of their blooms.

FORCING DEPARTMENT.

Vineries.—Let the rods of Vines which are just starting be tied horizontally across the rafters, that the flow of sap may be equalised, and the whole of the buds induced to break regularly. In the earlier houses use the utmost vigilance to keep down insects, especially the red spider; this attention will be particularly required in houses where the ripening of the fruit renders it necessary to maintain a drier atmosphere. Where proper care has been taken to keep the enemy in check to this time, little difficulty will be experienced; but if this is, or has been neglected, the gardener will stand a chance of seeing the leaves ripen as soon as the fruit, and of course he must expect only a limited supply of elaborated sap for the benefit of the future crop. Applying a wash of sulphur to the hot water pipes, or to the surface of the flues, is the easiest and quickest method of destroying these insects. Melons.—In

determining the number of fruit to be matured on each plant, exercise as much caution as you would in regulating a crop of Grapes; the proper medium of size, and perfection of flavour, depend upon the plants being neither over-stimulated nor over-cropped; the latter fault should be carefully avoided, as by it, not only are the fruits of the first crop inferior, but the chance of a second crop is rendered hopeless. Admit air freely during warm sunshine, and maintain a moist atmosphere by means of evaporating pans, and by sprinkling the paths and soil with water. STRAWBERRIES.—Continue to forward successions of this useful fruit, and by fumigation or syringing, destroy aphides on the leaves and fruit of those which are in progress; this demands particular attention, as these little pests suck the juices out of the fruit while in its young state, which of course spoils its appearance and prevents its swelling. With proper attention Strawberries should now be obtained as good as at any season; and every means which will contribute to produce fine well-flavoured fruit should be put in practice. Placing the plants near the glass, where they can have a free circulation of air, but at the same time be guarded against cold currents, is very important. The small weak berries should be thinned out, leaving from six to ten of the most promising upon each plant. Up to the time when the fruit begins to change colour, manure water may be applied with advantage once a week; but after that it should be entirely withheld, and even clear water should be given more moderately. The flavour of the fruit very much depends upon careful attention to these points.

FLOWER GARDEN AND SHRUBBERIES.

The evergreens which were placed in the flower beds before winter should now be removed to the reserve garden, in order that the ground may be prepared for its summer occupants. The beds which have been filled with Crocuses, or other winter and spring flowering bulbs, are generally prepared for this purpose by taking up the bulbs about this time; such a practice, however, is very objectionable, as the foliage is not sufficiently ripened; and even if the bulbs are left in the ground until properly matured, and then taken up, the flowers are not nearly so fine or so strong as they would have been if they had been left undisturbed. Every objection, however, may be removed, and much unnecessary labour prevented, by laying a few inches of fresh soil on the beds for the summer flowers, without disturbing the bulbs. When the latter operation is being performed, the leaves of the Crocuses should be tied together in knots, that they may have time to mature themselves, without interfering with their successors. In removing the latter in autumn, they should be drawn out of the ground, that the bulbs beneath them be not injured; at the same time, a portion of the spring top-dressing should be removed, sufficient to leave the bulbs about 2 or 3 inches from the surface. By this method, gorgeous masses of flowers are displayed, both winter and summer, without the plants of one season interfering with those of another.

FLORISTS' FLOWERS.

TULIPS.—After the late hailstorms, how do our amateur friends stand? Those who have suffered, and those who are safe, will, we imagine, patronise a small-meshed net in future. From information we have received from various parts of the country, Tulips are looking above the average; abundance of increase is reported, and, generally speaking, a fine bloom is anticipated.—Look well to Ranunculuses, as the leaves emerge from the ground they often throw the centre bare, which is consequently detrimental to the rising bloom. It will, then, be absolutely necessary to guard against this by stirring the surface soil of the bed. As for watering, our best authorities are *pro* and *con*—we say, if the bed is well made that they may easily be overdone in this respect. Carnations and Picotees will want little else but watering, should dry weather set in. Sticks, to which the spindles are to be attached, of course should be put down immediately. AURICULAS.—Seedlings will now require attention. From 700 blooming seedling plants saved from a collection, in which there were but a few Alpines, we have been astonished in not finding more than one in a hundred *bona fide* Auriculas. We are aware this is not very often the case, still we think, as they were strictly collected, and tallied correctly, without a possibility of mistake, that this wholesale falling back is somewhat singular. Remove the plants as the blooms decay into a shady situation, extracting the decayed petals, and covering the promising truss of seed from excessive wet.

KITCHEN GARDEN.

Those who have sown their Leeks in a frame (according to former directions), with the intention of transplanting, should now get the ground ready for them. To produce this excellent vegetable in perfection, it should be grown as large and quickly as possible, as the flavour is thereby rendered much milder. As the Leek is fond of moisture, its roots have a natural tendency downwards, deriving their nourishment principally from below the reach of the scorching sun of summer. The ground for this crop should be double dug, 18 or 20 inches deep, and the manure laid into the bottom of the trench, which should be previously loosened up with a fork. Of the planting we will speak in a future Number. After this time it is better to sow Lettuce where it is to remain. The drills should be drawn 10 or 12 inches apart, and a few seeds dropped in at intervals of 3 inches; these patches, as soon as they are fairly up, should be thinned to one plant. It is better to avoid transplanting Lettuces in summer, as the tap-root is liable to get broken in the operation, and the plants have to depend for their support on the surface soil, which for this crop is too much exposed to the drying influence of sun and wind. The plants are thus rendered deficient of that crispness and succulence which is so indispensable in this salad, and are much more liable to run to seed. In hot summers, transplanting will only succeed in such ground as that of a London market-garden, where the soil is very rich and moist.

HARDY FRUIT GARDEN.

Disbudding wall trees will be the principal work in hand, during the next few weeks, in this department. In the final regulation of the shoots, do not allow more to form wood than can be conveniently trained in. When working at wall trees, avoid treading upon the soil; a plank and a few bricks, moved along as the work advances, will prevent the compression of the soil, and add no little to the comfort of the workman.

State of the Weather near London, for the week ending April 25, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

BEE-HIVES: *A.* It is difficult to answer your question, as nearly every writer on the subject recommends some particular hive. But from experiments carried on for several years in the neighbourhood of London, for the purpose of testing whether a straw or wood hive was most conducive to the well-being of bees, the preference seemed much in favour of a well and strongly made straw hive, as nearly spherical as possible, being about two-thirds of a globe, merely depressed enough at the top to allow a board (for supporting a glass cap or feeder) to be fastened on, the space between the board and the top of the outside of the hive being filled in with plaster of Paris; round the outside of the lower part a strong Ash hoop is fastened, and the space between the lower part of the outside of the hive and the hoop is also filled in with plaster of Paris; while the plaster is still soft, the hive is worked about on a flat board to obtain a flat surface, so that when the hive is in use it fits closely to its board. At the back of the hive a piece of stout glass, 4 or 5 inches by 3 inches, is inserted, which is covered by a piece of woollen cloth twice folded, fastened on by a tin tack at each corner. The board at the top of the hive should be a well-seasoned piece of Mahogany, ½ inch thick and about 10 inches diameter, with a hole cut out in the centre of it of 1⅞ inch diameter, and to correspond with the hole at the top of the hive. A straw cover is made to pass moderately close over this board, and to rest on the top of the hive sufficiently high to admit a large glass being used under it. The hive-board is made of two pieces of ⅜-inch thick white Pine, about 18 inches by 16, screwed together across the grain of each, and is further secured from warping by a piece of iron hooping being screwed entirely round it, the screws being alternately placed in each piece of the board. The entrance to the hive is formed by grooving out a passage in the board, gradually sloping upwards to the centre of the part covered by the hive, which groove should be rather more than 5 inches wide, and, at the part where the hive crosses, it should be ⅜ inch deep. The best mode of contracting this entrance, when necessary, is by wedges of wood. It was found, after several seasons' trial, that swarms of equal size, put into these at the same time as into common straw, wood, or cork hives, and treated as nearly alike as possible, were most in health and strongest the next spring; gave off the earliest and largest swarms; filled and sealed the comb in the glasses or caps earlier; and, from the shape admitting the current of air to every part of the interior of the hive, they were not troubled by the larva of the wax-moth. They are economical in price, and, with the necessary care of keeping them from wet, will last as many years as a stock can flourish in the same hive. *Y.*

BOOKS: *L L D.* We know of no book that will answer your purpose.

BULBS: *Wotton.* Four inches is quite deep enough in light or sandy land; two to the crown of the root is deep enough in heavy land. No doubt the yellowness of your tree Box plants is chiefly owing to their having been transplanted. Give them a little mulching over their roots.

CAMELLIAS: *Cork.* Why try to grow them in frames and with the aid of dung? Plant them under a north wall or fence in the open air, and put some sashes over them when they show their flower-buds. That is all they want. They are perfectly hardy in Ireland.

DISEASES: *L D.* Your plants are ruined by bad gardening. It is useless to advise you to do anything with such a gardener. If you will find an industrious careful man, he will put all in order again, if the plants are not in a hopeless state.

HARDY HERBACEOUS PLANTS: *X.* Apply to Mr. Plant, of Cheadle; Messrs. Backhouse, of York; or Mr. Masters, of Canterbury. Such things are much out of fashion.‡

HOLLIES: *J S H.* Prune them in now. Whether young Hollies should be topped or not depends on the purposes for which they are wanted. Your other questions next week.‡

INSECTS: *Sub.* We know of no better remedy for scale than washing with hot water. With a little care we should think the operation might be effected without injuring the fruit.‡—*G R.* The insects found under the surface of the ground in your garden are unmatured specimens of the fly of St. Mark (Bibio Marci). They are not injurious, apparently feeding on decaying vegetable matter. *W.—S T.* The little yellow masses produced from the caterpillar which fed on your Apricots are the silken cocoons of a number of minute parasitic ichneumonidæ (Microgaster glomeratus), the larvæ of which fed within the body of the caterpillar and destroyed it. *W.—Este.* The two larvæ found beneath the bark of the Downton Pippin are the caterpillars of some small moth, most probably Œcophora sulphurella, which will very shortly assume the winged state. Were their burrows in the solid wood, or merely beneath the bark? *W.—S F.* No; the larva sent is not the wireworm, it is the larva of some species of moth of the genus Agrotis. *W.—H R I.* The small larvæ infesting your young Irish Juniper shoots are the caterpillars of some small moth (Tineidæ), and the eggs have just hatched a number of minute cooper caterpillars, most probably those of Thera juniperata. These must, therefore, now be sedulously attacked; and we know no better plan than enveloping the tree, if not too large, in a coarse bag, and fumigating it with tobacco smoke, or by dipping the young shoots in limed soap-suds with some quassia mixed with it. *W.*

LAWN: *B R H.* It may be mown now. April 27 is not *early.*‡

NAMES OF PLANTS: *A Sub.* The flowers appear to belong to Pachysandra procumbens; but if so, the leaves are those of some other plant.—*A B.* Apparently a leaf of Eranthemum pulchellum. What you call an insect on the back of it is its own natural secretion. Pray let it alone. You might as well scald your chin in order to get rid of your beard—if you have one.—*W W.* Some Cape Asphodelus, but nobody can identify such a ragged morsel.—*J S H.* Asplenium Trichomanes, very common. The rare Fern of Perthshire is Asplenium alternifolium. *S.—W M T.* Cyrtochilum maculatum.—*Marcelly.* A, Saxifraga tridactylites; B, Cochlearia officinalis.—*R H.* 1, leaves of a Phrynium; 2, husks of Indian Corn.—*W G.* Vestia lycioides.—*Anon.* Hibiscus Patersonii.—*P E.* Baccharis halimifolia.—*Omega.* Caltha palustris, Ranunculus Ficaria, Ceterach officinarum, Luzula campestris, Tussilago Farfara.

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

PINE-APPLES: *A M.* Pines may be grown in all their stages and ultimately fruited in pits heated by dung, unassisted by fire heat in any way. Where stable dung may be had in any quantity, and fuel is scarce, and where the pits are formed upon the best principle, there is not any difficulty in doing so; on the contrary, the largest Pines ever seen in this country were so obtained. You should study "Mills on the Pine-apple."

POLYANTHUSES: *W W.* Alexander, George the Fourth, Formosa, Invincible, Bang Europe, Beauty of England, Princess Royal, Defiance, Freedom, Cheshire Favourite, Nicholson's Gold-lace, and Coe's Prince Regent.‡

POTATOES: *P A.* So long as there is risk of Potato disease, refrain from the use of all manure of every sort. Be contented with a moderate crop sound, rather than strive for a large crop which may rot. There will be no difficulty in growing Swedes, Mangold Wurzel, and Raspberries in such land as that.

SEEDS: *P T O.* It should be a weak solution of oxalic acid. Daphne indica bears cutting well. Sow your Deodar seeds in pure loam in pans in a Cucumber frame, and when they are up gradually harden them, and remove to the open air under a north wall.—*T H, Swainton.* Treat your Goa Cedar seed in the same manner.

SIX GOOD CLIMBING AUTUMN-FLOWERING ROSES: *W W.* Bourbon: Acidalie, white; Gloire de Rosamène, carmine; Pierre de St. Cyr, pale rose. Noisette: Du Luxembourg, lilac rose; La Biche, flesh-colour; Pourpre de Tyre, violet crimson. In time these will attain the height of 10 feet.‡

SLUGS: *Sub.* See a paragraph in our "Home Correspondence" of to-day.‡

STUMPS: *L S.* All that you can do to render them *ornamental* is to make them the shafts or stands for large rustic baskets. Objects of this kind are by no means suitable to decoration; they are much more at home in the fire-place.

TOLL GATES: *J H J.* We cannot undertake to answer legal questions; on the contrary, we have repeatedly refused to do so—for this reason, more especially, that no safe opinion can be formed upon a point of law, in the absence of much more complete evidence than newspapers ever receive. Besides, all such questions ought to be put to professional men, in a professional way. As, however, your case is peculiar and one of some public interest, we have no objection to make it partially an exception to a very wholesome and necessary rule. You say that you are summoned for refusing to pay toll for "Cauliflower plants growing in pots." Whether you are right may depend on the local act by virtue of which the toll-gate in question was erected. The section of 3 Geo. 4, c. 126, is to be construed liberally, and we should think that "pots" might, under certain circumstances, be considered as implements of husbandry. The liability to pay toll does not, however, turn on that alone; for if the Cauliflowers in pots had either been just bought, or were going to be sold or disposed of, toll would be payable. We are not acquainted with any case in which the meaning of the words "implements of husbandry" has been decided. All the law on the subject will be found collected in the last edition of "Burn's Justice," vol. iii., p. 724, and "Woolrych's Law of Ways," p. 165. *N.*

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

TULIPS: *C N R.* We have suffered several times in a similar manner, and our applications of soot, pounded chalk, and lime appeared to have little effect. The best results were attained by removing the soil, as low as possible, and placing pounded charcoal round the stem, but even in these cases the bulbs diminished much in size. *W.*

WALLFLOWERS: *Z.* It is possible that cuttings taken from a very double Wallflower would produce single flowers when struck, but not probable. Oxalis floribunda does not require any particular soil. A light leafy compost suits it *best.*

WEEDS ON WALKS: *Hutton.* Do not use arsenic. Employ labourers, and do not allow the weeds to grow again when once removed.‡

MISC: *Amateur.* Liquid manure will not do your Convolvulus any harm; but it may make it grow too large for your purpose.‡—*W B S.* Head down your Spruce Fir in November. Remove the large Laurel branches now.‡—*Emily B.* You can only obtain Scrophularia nodosa by enquiring at botanic gardens, unless you can find it wild.‡—*Charles.* Dielytra spectabilis has frequently flowered in collections about London. Its proper season of flowering is March and April in the greenhouse. Nobody has yet tried it out of doors that we know of.

SEEDLING FLOWERS.

AURICULA: *G B S.* Shrivelled up. Can you send us another bloom.*

CINERARIAS: *S and J D.* White tipped with rosy purple; disc brownish purple, a clean-looking attractive flower, but too small.*—*J C.* Worthless as regards form and colour. If sweet-scented it had lost its perfume when it reached us.*

PELARGONIUMS: *J R.* Smashed to pieces in coming through the post; colour good, but petals too pointed.*

STRIPED AZALEA: *C.* See our report of Worton Cottage meeting in another column.*

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	£10	0 0
Clover Manure, do.	...	11	0 0
Turnip Manure, do.	...	7	0 0
Superphosphate of Lime	...	7	0 0
Sulphuric Acid and Coprolites	...	5	0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton. in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, April 27.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.
Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

JOHN BAILY, PURVEYOR TO HER MAJESTY AND H.R.H. PRINCE ALBERT, 113, Mount-street, Grosvenor-square, London, Dealer in every description of Useful and Ornamental POULTRY and WATER-FOWL, Dorking, Hambro', Spanish, Polish, and Cochin China Fowls. Gold and Silver Spangled Bantams. All sorts of Pea Fowls. Gold, Silver, Pied, and Ring-necked Pheasants. Tame-bred Pheasants in any numbers. Live Partridges for turning out.—Priced Lists and Estimates forwarded by post, on application.

The Agricultural Gazette.
SATURDAY, APRIL 27, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	May 1	Agricultural Society of England.
THURSDAY,	— 2	Agricultural Imp. Society of Ireland.
WEDNESDAY,	— 8	Agricultural Society of England.
THURSDAY,	— 9	Agricultural Imp. Society of Ireland.

THE *Morning Herald* considers that the character of Mr. CAIRD, of Baldoon, as a practical farmer, is of some public importance at the present time. That Journal lately devoted its leading article to an attempt to prove that the testimony of this gentleman on agricultural subjects ought not to be considered of any authority whatever. Its correspondent asserts that Baldoon *was* among the most fertile farms of its locality, and *is* among the most exhausted of them—that its occupying tenant holds a very low standing indeed, whether as a man or as an agriculturist—that in fact he is "universally considered a bad neighbour—a bad farmer—a bad tenant."

Now we presume that Mr. CAIRD cannot complain of his *agricultural* status being called in question by his opponents: it is not an unfair, and, when practicable, it is an easy method in controversy to throw discredit on the argument of your opponent by proving his incompetency as witness or judge of the facts he urges: but apart from this we have yet to learn that any argument can be strengthened by personal attacks, such as the above. Let Mr. CAIRD be proved a bad *farmer*, and then, notwithstanding that he confines himself to describing the operations of others, his influence as an agricultural writer will very properly diminish; but what sort of logic is it that aims at the agriculture of an opponent through his *personal* character? *Blackwood* wastes 30 pages in attempting to maintain a charge of vanity, and the *Herald* rejoices on behalf of its readers to have proved one of general worthlessness; and so, in the absence of argument, the interest of the controversy is kept up by slander and abuse, neither of which, unfortunately, can in the least tend to a satisfactory conclusion of the discussion.

We agree however with the *Herald* in thinking that the *agricultural* status of our agricultural writers is a subject on which their readers may indulge a reasonable curiosity; and we have accordingly made enquiries with the view of ascertaining how the charges of that journal in this respect have been received in Wigtonshire. The following letter is from a gentleman who though now resident in Dumfries is well known in Galloway, and well acquainted with the agriculture and the agriculturists of that part of Scotland. Mr. HARKNESS was Secretary to the Rhins of Galloway farmers' club, and no one is better qualified to give an opinion on the subject to which the *Herald* refers. He says:

"I have known the farm of Baldoon for upwards of 20 years, long before Mr. CAIRD became tenant of it. I was very generally acquainted among the tenantry of the county. I went into the county seven years ago, resided there, and took a deep interest in establishing the Rhins Farmers' Club, which was highly approved by Mr. CAIRD, and in which club the principles of high or good farming were advocated so far back as 1844–5, and afterwards. Finally, I examined Baldoon farm and management about a year ago, and from such data, and a personal acquaintance of Mr. CAIRD for at least six years, I can confidently and deliberately say that there is not a word of truth in the charges brought against that gentleman by the *Herald's* correspondent. He says 'as much as four guineas an acre used to be the average rent of land in this district,' and he insinuates that Baldoon, once *the best*, is now the most deteriorated farm of that district. Both statements are glaring misrepresentations. Neither the farms of that district, nor of any portion of Wigtonshire ever averaged four guineas; and the farm of Baldoon, certainly a first-class farm, of heavy clay soil, never was in so highly improved, in so well cultivated, and so productive a condition as it is now under Mr. CAIRD's management. The greater portion of the land is very tenacious clay, and in a wet and changeable season it is most difficult and precarious to work and crop. This applies more especially to green cropping and Wheat growing. It is not true that 'this farm now presents the picture of want and desolation, slovenness and poverty.' I went over it little more than a year ago, and then Baldoon was in excellent *heart* (after complete draining at the tenant's own expense); his dairy stock, Ayrshire cows, were first-rate—clean, well fed, and managed; his Galloway cattle, in course of fattening, were of prime quality and symmetry; his Swede roots were also first-rate; his drainage of liquid, as well as the preserving of solid manure, properly provided for; and, in short, all the arrangements of the offices, and the farm, were such as would satisfy any person acquainted with such matters, that Mr. CAIRD is alike an intelligent, a scientific, and a good practical agriculturist. And what I now deliberately state I not only know to be correct, but I know that my statements will be cheerfully corroborated by not only Mr. C.'s neighbours, but by all the tenantry of Wigtonshire, and by many in the stewartry of Kirkcudbright. The *Herald's* correspondent refers to the Carse of Gowrie, the land and farming of which I have seen, but I question much if throughout all that far-famed agricultural district any one farm will be found so well cultivated and managed generally as Baldoon. Far from Mr. CAIRD being regarded as 'a bad neighbour,' he is universally esteemed as a good one; instead of being considered 'a bad farmer,' or 'a bad tenant,' not only the whole neighbourhood, but the whole county, and all who have the pleasure of his acquaintance, know him to be an intelligent gentleman, a kind, enlightened, and benevolent man, an excellent neighbour, agriculturist, and tenant. I feel it to be simple justice to express these truths in opposition to charges so unfounded, I would say, malevolent.

"Whether Mr. CAIRD's publications illustrative of the principles and practice of 'high farming,' be fully borne out, and the example of Auchness be such as can with safety be recommended as 'high farming' and good management for the tenantry of Great Britain and Ireland generally, is a question which the London *Herald* might have discussed without having recourse to vituperation, the baseless inventions of fancy, or the palpable misrepresentations of a malicious correspondent. The free trade movement has unquestionably progressed with greater rapidity to a low scale of agricultural prices than most of its friends anticipated would follow the change of the law; and the ordeal of an unavoidable transition state, consequent upon that change, is most severely felt by the British farmers generally. It is, therefore, the duty of all the friends of the agriculturists to look this difficulty fairly in the face, investigate the principles and operations of the systems of husbandry hitherto pursued, and discuss and test every reasonable improvement which may be suggested on the ground of efficiency and economy, with the view of raising a larger produce of food at comparatively less outlay. This seems to me a course equally wise and necessary in the present emergency of farming, one which I am sure Mr. Caird would approve; but at the same time I must add it is a course of sound policy, which the attacks of the *Morning Herald*, if at all operative, may retard but cannot promote. Upon the facts now stated you may rely. They can be substantiated by hundreds well qualified to judge in such matters."

We should apologise both to Mr. CAIRD and to our readers for making personal character the subject of discussion in these columns; and were it not that the matter really is of some public importance, we certainly should have carefully avoided it, but the thing has in a manner been forced upon us, not only by its own intrinsic merit, but by the singular fact, which seems fairly deducible from the past history of the Auchness controversy, that to hardly any other agricultural journal would testimony such as the above be welcome. The "racy and trenchant" criticisms of his opponents are received with acclamation, but Mr. CAIRD's own defence has been scouted and his agricultural character disparaged. Let his experience be a warning to all the enterprising agriculturists of the day; if any of them thinks he knows anything likely to benefit his fellows, then if he values his peace, let him hold his tongue; for if Mr. CAIRD's reviewers have not taught him that lesson, he must be dull indeed.

WHILST the admission has been freely made that, under the superintendence of a competent surveyor the funds annually raised for the repair of roads might be more judiciously spent than under the present system,—there is, nevertheless, a growing dislike in the agricultural districts to the measure at present under Parliamentary consideration.

We are far from thinking that our present system of ROAD MANAGEMENT is perfect; on the contrary, after Mr. PAGAN has shown us that 5*d.* out of every 11*d.* goes in collecting the tolls upon our highways, there can be but one opinion of such a system, and had the Government measure attacked this monstrous evil the public would have readily supported them. Year after year each Government has held out promises that this crying evil should be remedied, and after all our expectations we are sadly disappointed that the country still remains consigned to the tender mercies of "*Pike men*" and turnpike trusts. No doubt the township roads as at present managed are far from faultless; but with the roads under the management of trustees they have nothing to fear from comparison. One of her MAJESTY'S Ministers, a short time ago, when advocating the necessity for Government interference with township roads, quoted a case where the expense on a township road had been gradually increasing, whilst a portion of turnpike in the same district had gradually diminished in expense,—the inference being bad management in the former case, and economy in the latter. This, we maintain, is a most unfair way of putting the case; and the inference we would draw is, that railways have completely changed the line of traffic from the old turnpike roads with which they often run parallel, and opened out so many new resources that the township roads have now become the main thoroughfares of the country.

But this comparison between the alleged superior management of the turnpike roads by trustees, over the township roads as managed by parish officers, is also particularly unfortunate as long as the former are some millions in debt, which has increased, is increasing, and will increase. We lately met with a farmer whose land lay between a turnpike road and a township road, by each of which the distance to market is about equal. In his case the contribution required of him yearly to the turnpike road trust is 23*l.*; to the township road, 9*l.*

We quote this case, as we are satisfied it is by no means a solitary one, and it surely shows anything but superior management on the part of the turnpike road trust.

The thanks of the community are due to Mr. PAGAN for having in such an unanswerable style called attention to the iniquities of the *pike* system—it is truly one far in arrear of the civilisation of the day. The frightful scenes of riot, which took place in the quietest portion of the empire, are the necessary results of its action when it arrives at perfection. Certainly the extravagant method of toll collection must be given up. At present the more active a farmer is, and the better the crops that he grows, so much the more does he pay in toll; it therefore operates as a direct tax upon his industry.

What we wish to see is, both turnpike and township roads to be placed under one system of management—the tolls on the former to be at once swept away. The first difficulty to be overcome is the debt which stands against the turnpike trusts. We would, of course, recommend that the tax for the liquidation of this debt should be spread over as large an area as possible, certainly not less than a county, and whether it be raised by a tax on horses or by a special rate is immaterial.

As a means for raising the necessary funds for keeping the roads in repair, no other machinery is necessary than is at present adopted in the several townships. If these were placed under the superintendence of a district surveyor, with summary powers for making repairs in case of neglect, this is all the machinery that we see necessary.

Could such a reform as this be carried out, the relief which the removal of the toll bars would at once afford would be a sufficient set off against any other temporary inconvenience which the change might produce.

THE VALUE OF AGRICULTURAL LABOUR.

Column A gives the present weekly wage of able-bodied men. Column B their weekly wage at harvest time. Column C states the daily wage of female labourers now, and D their daily wage in harvest time. Columns E, F, G, H, contain the prices of different sorts of piece-work; E, of mowing Clover per acre; F, of mowing Meadow-grass; G, of reaping Wheat per acre; and H, of threshing and cleaning Wheat per bushel. Column I gives the cost of digging, per yard in length, a drain in clay subsoil free from stones, 3½ feet deep, 14 inches wide at top, and 3 inches wide at bottom, *i. e.*, 42 × 14 × 3, or some other dimensions specified. Column K gives the ordinary cottage rent.

‡ Pay for over-hours.											

REMARKS ON THE KING'S SOMBORNE SCHOOL.

The popularity of this school is altogether unprecedented. Everywhere else the inspector is accustomed to be told of the indifference of the poor to the education of their children. Here he finds them manifesting an earnest desire to obtain for them the benefits of it. Agricultural labourers send their children from other parishes, from three to four miles daily, to the school,* and one-seventh of the resident population of the parish daily assembles in it.

Wherever he goes, the inspector's ear is familiar with the complaint that funds for the maintenance of the school are deficient; that the fees are wrung with difficulty from the hands of the parents, who are too poor to pay them; that the landlords and farmers are unwilling to contribute to the school, and that competent teachers cannot therefore be provided, or sufficient in number. Here, in a district where the rate of wages is at least as low as in the others, and where, if the people be not as poor, it must be due to the operation of moral causes, he finds a self-supporting school, having more than the usual staff of teachers,† adequately paid. At other schools one-third of the children are generally absent, and if the fee be insisted on, the inability of the parents to pay it is generally assigned as a principal reason of this irregularity in the attendance.‡ Here the payment of the school fee is strictly enforced, and the average daily attendance is more than eight-ninths of the children on the books.§

In other schools nothing so discourages the inspector as the inadequate supply of school-books, the injudicious selection of them, and their miserable condition; for all this, the poverty of the school is given him as the explanation; and if he is desirous to preserve the character of a discreet man, he will not venture to hint, as a possibility, that the children might be induced to buy proper school-books for themselves. Here he finds every child in possession of as many school-books as it wants, of the best kind, well bound, and in a sound condition; and he finds, moreover, that the child has purchased them all for itself, the school providing none.*

Elsewhere the early age at which the children leave, is spoken of as fatal to the success of the school. Here, although the very goodness of the school has a tendency to produce this result, and does to a certain extent produce it, the parents persuading themselves that their children get to know enough in a good school sooner than in a bad one, there is evidence that a labourer is capable of making for his child the sacrifice of the weekly wages he might earn, if sent to work, that he may send him to the school. There were in May, 1847, 11 girls in the first class above the age of 13, whose parents were of the condition of labourers; eight of these were above 14 years of age. There were of the like condition, five boys of above 14 years of age, and nine above 12.†

Your lordships will appreciate the amount of that sacrifice which a labourer earning 9*s*. a-week makes, when he sends to school a boy who might add to the weekly income of the family from 1*s*. 6*d*. to 2*s* 6*d*., and not, I trust, consider misplaced the expression of an opinion which this example has but confirmed in my mind—that the poor will be found capable of making, to a far greater extent than they do now, the sacrifice involved in sending their children to school instead of to work, whenever this sacrifice shall be justified by the character of the education offered to them.

In other schools only 23 per cent. of the children remain after they are 11 years of age; here 32 per cent. In other schools 4 per cent. of the boys and 10 per cent. of the girls are above 13 years of age; here 10 per cent. of the one and 19 per cent. of the other. Here, finally, the average age ($10\frac{1}{17}$ years) of all the children in the school is nearly that of the monitors in other schools.*

There is no sacrifice made for the cause of education so great as that of the agricultural labourer, who, when he might send his son to work, sends him to the school. Nor is this a less sacrifice to make at King's Somborne than in other agricultural parishes; but, on the contrary, a greater, there being a custom of sending the children out to tend cattle in the large fields or open downs, which is in some degree peculiar to the place. Neither are the farmers more disposed to promote the education of the labourers' children there than elsewhere. They claim them at the earliest available age for what is called bird starving, pig watching, &c. There is no occupation, however slight, which does not stand, in their estimation, before the school, and they look upon their further education after they are able to go to work, as an unjust deprivation of their labour, and an unwarrantable interference with the privileges of their own children.†

* There are at the present time 26 children who attend the school under these circumstances.

† Two masters and two mistresses, and (before the appointment of apprentices) paid monitors.

‡ In the iron districts of South Staffordshire, at a time when the wages of a large class of workmen were 50*s*. per week, the irregular attendance of the children was attributed to the inability (the unwillingness?) of the parents to pay the school fee.

§ In the month of May, 1848, when the hooping-cough was prevalent, the attendance was as follows:

	Number on the Books.	Average daily Attendance.
Boys	92	85
Girls	93	80
Infants	34	30
Total	219	195

* 29*l*. 14*s*. 6*d*. were paid by the children for school books thus supplied to them in the year 1847, at wholesale prices.

† The following Tables afford the means of comparing the ages of the children in the King's Somborne school with those of the children in 47 schools in the Midland Districts.

Table I.

King's Somborne School. (90 Boys, 82 Girls.)	Number per Cent.				
	Under 7 Years.	7 to 9.	9 to 11.	11 to 13.	13 to 17.
Boys	15½	26⅔	25 5-9ths	21	10
Girls	13	23	29	14	19
Total	14	25	27	18	14

Table II.

(From Report on Midland Districts for 1846, p. 151. 8vo Edition.)

Midland Districts. (2044 Boys in 27 schools, 944 Girls in 20 schools.)	Number per Cent.				
	Under 7 Years.	7 to 9.	9 to 11.	11 to 13	13 to 15
Boys	22	28	32	14	4
Girls	19	27	25	18	10
Total	21	27	28	16	7

* See Report on Midland Districts for 1844. The average age of 3756 boys in 46 schools of the Midland Districts was from 6⅝ to 8½ years; and of 2301 girls in 33 schools, from 7⅓ to 9 1-7th years.

† Mr. Dawes speaks thus judiciously on this subject: "In agricultural districts the employer does not encourage the labourer to educate his child; on the contrary, his mode of thinking and of acting is in every way against it. He has no feeling that the respectability of the labouring classes would be advanced by education; or, if he has, he immediately becomes jealous of their being brought nearer to himself, not seeing that the class to which he belongs will in the end be equally advanced. In fact, he has no notion of worth in the labourer, as a man, or as a fellow-creature, but only values him as a machine or instrument by which a certain quantity of work is to be performed; and does not think that, although he professes to be a Christian, it is any part of his duty, as such, to endeavour to improve the moral condition of the labourers about him, by making them more intelligent, more sober, and better conducted in every relation of life, or that, by doing so, he adds to his own respectability. In the eyes of too many of the employers, the labourer who spends his money at the beer-house, neglects his family, and is perfectly regardless as to how they are brought up, is considered quite as useful as the one who would struggle hard to get his children an education, and try to raise them above those low and degraded habits to which they have hitherto been accustomed. Let those who act thus, if higher motives will not influence them, weigh well the observations of a modern writer, that 'independent of moral grounds, the kindness, sympathy, and attention of an employer to his workmen is the safest and most profitable money speculation in which he can engage.' I have never known a single instance of a farmer encouraging the labourer to send his children for a longer period to school, however trifling the work for which he wanted them. I have known instances of a parent wishing to continue a child, but his employer preventing him by requiring his services when so young, that it would have been far more creditable to have employed an older boy."—*Hints on a Self paying System of National Education*, p. 19.

To complete the contrast of this school with all others known to me: Whilst I have found the success or failure of other schools attributed to the personal influence of the clergyman and other respectable inhabitants over the parents, by a moral violence, compelling the children to the school, here there is obviously, on both sides, the most complete independence; the school offered on the one hand, and accepted on the other; an education provided such as the parents think likely to benefit their children, and the parents availing themselves of it for their benefit; the father consenting that out of his week's wages the school fee should be paid, and the price of the school-books; the mother yielding to the school her daughter's labour in the household; and both, that their child may enjoy a privilege of which they have themselves no experience, submitting to the privations which must be endured, when the small weekly earnings of the family are diminished by the 1*s.* 6*d.* or 2*s.* 6*d.* which that child might have earned.

That explanation which it is easiest to give of the unprecedented popularity of the King's Somborne school is, to attribute it, not to any peculiar adaptation to the wants of the people it is intended to benefit, but to extraordinary skill on the part of the master, or to remarkable tact and aptitude for teaching and school-keeping on the part of the rector. Were this the case, it would be impossible for me, in recording the results of my examination, to speak of them as generally attainable, and the example of the King's Somborne school would lose half its value. I trust, therefore, that I shall be pardoned, if I record the impression that the qualifications of the master are not in advance of those of the masters of very many other schools not equally successful; and that the rector (whilst the result shows him to be a very able teacher) would, I think, lay no claim to extraordinary technical skill or unapproachable readiness, or simplicity, or aptitude in his way of dealing with children. He takes no pains to make the public exhibition of a winning manner in teaching, and is certainly the last man in the world to compromise, in his intercourse with children, the dignity of his character or of his station.

His success has, in point of fact, been accomplished by honester and better means; and holding, myself, the opinion that he has had precisely the same kind of difficulties to contend with that other clergymen have, and that any earnest and enlightened man who followed in the same path would achieve the same results, I have thought it the more expedient to record this opinion, as I have constantly heard the whole merit of the school attributed to certain gifts and graces peculiar to the rector himself. The probabilities of the case are all, in point of fact, opposed to such a supposition. Mr. Dawes is a distinguished member of the University of Cambridge, and was for many years resident in that University as fellow and tutor* of his college; and a parish school was to him an unaccustomed place, when, a few years ago, he opened that of King's Somborne.

When I hear it asserted that such an education as that given in the King's Somborne school cannot be offered to the poor of the whole country, because it is not to be expected that such a rector as Mr. Dawes can be placed in every parish, I do not dispute the premises, but I see nothing to justify the conclusion. The example of the King's Somborne school would be of little value if it did not embody a principle; and there is no reason why, if that principle were duly appreciated, our training schools should not supply masters qualified to carry it out; or why, if such masters were provided, one mind such as Mr. Dawes's should not control many such schools.

It is true that the attention given to the school by a highly educated man like Mr. Dawes raises it above other schools in the estimation of the people about him; and, considering what has been the previous training of our present national schoolmasters, this is not to be wondered at; but I speak of another state of their education, and I see not why men, duly and specially educated for the office, should not create everywhere the same confidence, and accomplish the same or yet greater results. *Report to the Committee of Council on Education.*

Home Correspondence.

In answer to a Country Curate, the best works I can recommend are, the "Cottage Gardeners' Assistant," price 1*s.*, in which work, at page 56, he will find an excellent plan for managing a kitchen garden of 20 poles—or one-eighth of an acre; and Mr. Cuthill's admirable work on the Potato (which no Potato grower should be without) which may be obtained post free from Mr. Cuthill, nurseryman and florist, Camberwell; I think the price is a shilling or eighteen-pence. The best stock in such a neighbourhood would be pigs, as the least expensive to purchase in the first place, and quicker in their returns, affording, too, an ample supply of the most stimulating and enduring of all manures. In September let him purchase two young breeding sows in pig of their first litter, and about a month from their time of pigging; these will, if of good quality and large in size for their age, probably cost from 60*s.* to 75*s.*; indeed at this present moment a good sow three months advanced in her second litter is not worth more than 80*s.*; from each of these he may this year obtain a litter of pigs, and then convert them into baconers by the end of February. When he parts with these let him procure two fresh gilts as before, and that year and each succeeding one he will obtain two litters. I think he may fairly count on five at a litter as a general average, though seven (I speak from experience) is nearer the mark. This is the plan adopted by the cottagers in my neighbourhood, and one which I have found the most profitable—indeed the only profitable plan in pig-keeping. With regard to poultry keeping, let him purchase at once 16 hens (pullets), and two cocks of any breed, provided they are large sized, short-legged, any colour but white, especially the cocks, and with white legs. Should you approve of my doing so, I should be happy to send you an account of my poultry management, by which I obtain a net profit of 15*s.* from each hen. I would advise "A Country Curate" to plant one-half of his garden with Potatoes, one-fourth in kitchen garden, and one-fourth in Mangold Wurzel. As soon as he buys his sows he may begin to pull the leaves of the Wurzel for them. The Mangold Wurzel should be dibbled in rows 20 inches apart and 12 inches in the row. At these distances I have obtained the greatest produce, viz., at the rate of 42 tons per imperial acre. They should be sown by about the end of the present month. The Potatoes should have been planted in February, using whole sets, of about the size of a hen's egg, and planted at the same distances as the Mangold Wurzel. I prefer American Earlies, or as some call them, American Natives. I usually obtain from this sort about 100 sacks, 18 stones (of 14 lbs. per stone) to the sack; though my father, a more experienced hand than myself, has frequently grown 160 sacks of this kind per acre, or one sack to a rod; this was by spade culture, in a garden farm of about three quarters of an acre, mine by the acre in the open fields. I have drawn up a Cr. and Dr. account for the second and each succeeding year on half an acre of ground, supposed to be deeply drained (I mean 4 to 5 feet), a less depth, except under some circumstances, I have found, comparatively speaking, money thrown away. Last year I drained 3 acres (some of it tenacious clay) from 4 to 5 feet deep, planted them with Potatoes, which proved free from disease, and an abundant crop; and this spring the Wheat looks most luxuriant. Two acres of land in the same field, of exactly the same nature, drained 24 inches deep, is almost as bad as ever, though drained 4 years ago. But to return to the point. I suppose one quarter of the whole, *i. e.*, 20 poles or rods, to be trenched to the depth of 30 inches, taking care for the first time to keep the top soil at the top, unless the soil extends to that depth, when I would advise the top soil to be buried underneath, as in all probability it is full of the seeds of various weeds, as, if I remember right, "A Country Curate" stated that it had been allowed to run wild for some years. I always apply farm-yard manure for Mangold Wurzel, and 3 cwt. of superphosphate of lime per acre, the largest crops being always obtained from the use of farm-yard and artificial manures combined.

Cr.	£	*s.*	*d.*
½ acre or 40 poles, 25 sacks of Potatoes, at 4*s.*	5	0	0
¼ acre or 20 poles Kitchen Garden			
¼ Ditto Mangold Wurzel			
¼ litters of pigs, say 20 pigs, at 12*s.* 6*d.* each, sold when weaned at eight weeks old (a poor price) ...	12	10	0
2 fat sows, 20 stone, at 5*s.* They should weigh, if well kept, nearer 30 stone (14 lbs. per stone)	10	0	0
	£27	10	0

Dr.	£	*s.*	*d.*
1 waggon-load of straw	1	10	0
6 quarters Barley, at 24*s.*	7	4	0
Grinding ditto, at 2*s.* 8*d.* per qr.	0	16	0
2 quarters Beans, at 30*s.* per qr.	3	0	0
2 sacks seed Potatoes	0	10	0
Sundries	1	10	0
	£14	10	0

The expenses I have estimated higher, the produce lower, than I ought to have done, but I would rather be within the mark. The Mangold Wurzel, probably about 4 tons (an allowance of nearly 2 stone per diem to each pig throughout the year), should be boiled, and, having been mixed together with the Barley-meal, should be given when warm to the sows during the time they are undergoing the process of fattening, a trough of clean water for drinking being always come-at-able by the pigs. In summer I give the Mangold Wurzel raw, and the corn bruised and dry. *The Son of a Country Rector, Lincolnshire.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held, at the Society's house, Hanover-square, on Wednesday last, April 24; present, his Grace the Duke of Richmond, K.G., Trustee, in the chair; Earl of Ducie, Lord Wharncliffe, Lord Portman, Hon. R. H. Clive, M.P., Hon. J. J. Carnegie, Sir M. W. Ridley, Bart., Sir Robert Price, Bart., M.P., Mr. R. Barker, Mr. J. Bethell, Mr. F. Burke, Mr. D. Burton, jun., Col. Challoner, Mr. W. Clavering, Mr. E. Denison, M.P., Mr. W. Dennison, jun., Mr. G. Dyer, Mr. T. Ellman, Mr. A. Foster, Mr. F. Hobbs, Rev. A. Huxtable, Mr. Langston, M.P., Mr. Lawes, Mr. D. Lewis, Mr. Majendie, Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. H. Porcher, Mr. J. F. Powell, Mr. Pusey, M.P., Mr. G. H. Ramsay, Dr. Ryan, Prof. Sewell, Mr. Shaw (Lond.), Mr. Brinsley Sheridan, M.P., Mr. Bridgeman Simpson, Mr. E. Slade, Mr. Stansfield, M.P., Capt. Shawe Taylor, Mr. G. Vernon, Rev. J. C. Wharton, Mr. J. T. Wharton, and Prof. Way.

The following new members were elected:

Heale, Henry Newton, Highfield, Hemel-Hempsted
Coulton, William, Dean Court, Barton, Dean Prior, Ashburton
White, James, 266, High Holborn, London
Field, Charles, Trunk Farm, Horley, Bagshot
Lovaine, Lord, Albury Park, Guildford
Chalcraft, Thomas, Amory Farm, Alton, Hants
Talbot, Hon. Wellington Patrick, Honeybone Grounds, Evesham
Hartshorn, Thomas, Silkmore House, Stafford
Tyrrell, John, Exeter

The names of 20 candidates for election at the next meeting were then read.

Sewage of Towns.—His Royal Highness Prince Albert, as one of the Governors of the Society, transmitted to the Council, through Colonel the Hon. Charles Grey, a communication on turning the sewage of towns, at present the cause of disease and pestilence, into a source of national wealth, by its application to purposes of agriculture. Colonel Grey informed the Council that this important subject had, along with the general interest it had lately excited in the public mind, become a matter of interest and study to his Royal Highness Prince Albert, and that he was commanded by his Royal Highness to bring before the Council of the Society, for their consideration and inquiry, should they think the subject worthy of it, what had struck his Royal Highness as being a simple plan for effecting the object in view. Leaving it to more competent judges to decide whether the sewage should be used as a liquid manure, or solidified, upon which point his Royal Highness wished to give no opinion himself, he had confined his consideration to the latter mode of application, for two reasons; namely, that, in the solid form; 1. It could be more easily transported. 2. It could be obtained at the least possible expense. Colonel Grey then proceeded to describe the plan proposed by his Royal Highness, which was simply this: to form a tank, with a perforated false bottom, upon which a filtering medium should be laid; and to admit at one end the sewage into the tank, *below* the false bottom, when, according to the principle of water regaining its own level, the sewage liquid would rise through the filtering bed to its original level in the tank, and, provided the filtering medium had been of the proper nature and of sufficient thickness, it would be thus freed from all mechanical impurity, and would pass off into the drain, at the other end of the tank, as clean and clear as spring water. This simple and effective plan was illustrated by drawings, showing the vertical and horizontal sections of the tank, and by a neatly constructed model of its external form and internal arrangements. It was also clearly shown, by these sections, how the sewage matter could be let into the tank, or shut off, when necessary, in the simplest manner, by means of common valves; and with what facility such a filtering tank might be applied to every existing arrangement of sewers, without requiring any alteration in their structure. The filtering medium having abstracted from the sewage all extraneous matter, would, in all probability, become the richest manure, and could, at any time, by stopping the supply of sewage, be taken out by a common labourer with a shovel, and carted or shipped to any place thought most desirable. The solid matter, too, held in suspension by the sewage, would probably form a very rich deposit at the bottom of the tank, of a substance approaching in its qualities to guano, and could be extracted by removing the false bottom, which rested on arches or vertical supporters over the sewage below it in the tank, and could be easily made to lift up or take out for the purpose of such extraction. Two tanks might easily be constructed together, so that one might continue in operation while the other was being emptied. The experiment might be tried at any house-drain in town or country; in fact, his Royal Highness had himself tried the operation on a small scale with apparent success; and while he thus suggested an important and extensive application of the hydrostatical principle involved in the plan proposed, he wished to lay no claim to originality in the adoption of that well-known law of fluid bodies by which they make an effort, proportionate to their displacement, to regain their original equilibrium. On that principle was founded, as he was well aware, the upward-filtering apparatus used by the Thames water companies. His Royal Highness's great object was by the simplest possible means to attain a great end; to effect an essential sanitary improvement, and at the same time to create a new source of national wealth, by the very means employed for the removal of a deadly nuisance, and the conversion of decomposing matter, highly noxious to animal life, into the most powerful nutriment for vegetation. His Royal Highness, too, wished to offer no opinion on the details required to complete the plan proposed, or on the mode of carrying it out in the most effective manner. Supposing it to be right in principle, its advantages in an economical point of view could only, his Royal Highness conceived, be ascertained by practical experience; and it was on that account, that he wished to submit it to the consideration of the Agricultural Society, who might be better able to carry out the necessary experiments. It would remain to be decided what is chemically or mechanically the best, and what the cheapest substance for the filter; what the best and cheapest construction of the tank; how long the sewage will pass before the filter becomes choked; and how soon the filter could be sufficiently saturated to make it profitable as a manure. His Royal Highness had used as the filtering medium, the following substances:—

1. Charcoal: admitted to be the most perfect filtering substance for drinking water, retaining effectually

* For twenty years tutor of Downing College.

extraneous matters, and well known for its singular powers of purification.

2. Gypsum (plaster of Paris, or sulphate of lime): recommended by agricultural chemists, for fixing ammonia and other volatile substances, by the decomposition to which it becomes subject, when exposed to the action of volatile alkali.

3. Clay: in its burnt state, would act mechanically as a filtering bed; and in its unburnt state, on account of its aluminous salts, have also the property, like gypsum, of fixing ammonia, or of decomposing the ammoniacal and other alkaline salts present in manure; and in either state would be cheaply procured.

All these substances, his Royal Highness thought, would in themselves be highly useful as manures, independently of the purpose they would subserve as agents for filtration, or of the additional amount of manuring matter they would receive from the sewage which they purified. His Royal Highness, however, in thus incidentally referring to the substances he had himself employed for the filtering medium, was well aware how many more of equal, if not superior, value would suggest themselves to others, who, like himself, felt an interest in effecting the important object proposed. As he had given no opinion on the general question of the liquid or solid application of manure, but had merely stated the grounds of preference, in a practical sense, of the solid form over the liquid for the purposes of the filtering operation under consideration, his Royal Highness entered into no discussion on the amount of manuring matter retained by the filter compared with the soluble matter that might pass through it along with the water, and remain in that liquid in a soluble, colourless, and transparent form; nor of the value of such filtered water for agricultural purposes. He had confined his observations to the agricultural value of the filtering bed, and the rich deposit obtained in the purification of sewage for sanitary purposes.

After the general expression of the members, of the gratification it gave them, to find that questions so intimately connected with the welfare of the community and the objects of the Society, enjoyed so large a share of his Royal Highness Prince Albert's deep interest and enlightened attention, Lord Portman informed the Council that the plan proposed by his Royal Highness was not any suggestion made to him by other parties, and which he had been induced to patronise; but that it was his Royal Highness's own plan, and the result of his own deliberate consideration on a subject that his Royal Highness regarded as of vital importance to the country. His Lordship thought the plan proposed the simplest and cheapest contrivance that he had seen for the purpose proposed in all cases where there was a sufficient fall of drain in the declivity of ground where it was employed. The communication with which they had been honoured by his Royal Highness, was a great proof of the useful matters to which his Royal Highness was devoting his attention. His Lordship expressed the pleasure it would give him to institute experiments on the plan proposed by his Royal Highness, in localities well adapted for their trial, and to report the result to the Council.—Sir Robert Price and Colonel Challoner considered the principle most excellent. Col. Challoner thought the only difficulty would be found in adjusting the filtering bed to a just proportion to the amount of liquid that would have to pass through it, in order that all the extraneous matter might be abstracted and retained. He regarded the first results of the trial already made to be confirmatory of Prof. Way's views of the power of certain soils over manuring elements.—Prof. Way was much pleased to find Prince Albert turning his attention to subjects of so much interest as the one his Royal Highness had then brought under the consideration of the Council. He had himself attended much to the question of the sewage of London; and whether in the most fashionable squares or in the most squalid courts, the crying evil was alike felt and present to the inhabitants of this great city. The sewage was itself divisible into two portions—the soluble and the insoluble. The insoluble matter consisted of cells of vegetable and animal matter, of hair and other floating substance: the soluble portion contained ammonia and the salts of potash and soda. The insoluble was retained by charcoal and clay. Clay, by burning, gradually lost its peculiar property of arresting ammonia: in its raw state it possessed twice the power in question. Burnt clay would however form a good mechanical material for the filling in of the filtering bed. He thought gypsum would not answer the purpose of arresting ammonia in a case like the present, where the solid matter only was intended to be obtained and employed as manure. The gypsum, being sulphate of lime, yields its sulphuric acid to the ammonia, and thus forms sulphate of ammonia, which, as a soluble salt, is at once dissolved and carried off by the clear filtered water, and is consequently not left behind in the filtering bed. Thus, unless the filtered water is also used for irrigating purposes, the ammonia is thus carried off and lost. He thought the plan proposed by his Royal Highness for obtaining the solid manuring matter of sewage, if employed in connexion with the application of liquid manure, would form a complete system, and secure all the advantages to be derived from such a source of manuring matter. He then concluded by some remarks on the application of liquid tank manure, and to the excellence of his Royal Highness's suggestion in reference to the solid matter of sewage.—The Duke of Richmond thought it desirable to ascertain how far charcoal, after its use as a chemical and mechanical agent, during the filtering operation, would prove of value as a manure; whether, during such action, it gave up its own substance to effect the changes produced, or became changed by such agency; or whether it simply retained the manuring matter, and again yielded it as a manure to the field. It would also, his Grace conceived, be as well to determine the value of the filtering bed in comparison with farm-yard manure.—Mr. Shaw enquired whether peat charcoal was recommended for use in this plan. Eight different experiments were at that time going on in different parts of the kingdom with such charcoal saturated with the best manuring matter.—The Duke of Richmond thought that Mr. Shaw probably meant charred peat, and in his opinion there was a wide difference between charred peat and peat charcoal, or charcoal of any kind.—The Council then unanimously voted their best thanks to his Royal Highness Prince Albert for the kindness with which his Royal Highness had honoured them with this interesting communication on so important a subject.

Cottage Grate.—Viscount Barrington, M.P., having called the attention of the Council to a cottager's grate he had seen, that he thought of considerable benefit where coals are generally burnt, the inventor had leave to exhibit to the members a model of its construction.—Colonel Challoner favoured the Council with the result of his experience in the use of household grates, and of the advantage of their being placed low down in the hearth, and with backs of peculiar construction, to prevent their splitting.—Mr. Pusey suggested, that as there was a prize of 5*l.* offered by the Society for the best "Cottage Stove or Range for burning coal," shown at the Society's Country Meeting at Exeter in July next, it would be at the option of the inventor of the cottage grate, of which a model was then exhibited to the Council, to make an entry of his invention for that occasion.—The Duke of Richmond concurred in this suggestion, which he communicated to the party in question, thanking him for the trouble he had taken in submitting the model to the inspection of the Council, but without conveying any opinion of its merits or otherwise.

American Churn.—The Council were favoured by Mr. Key, of Newgate-street, with an inspection of the new American churn, for which he is the agent, and with a trial of its operation in their presence. This churn consists of a square wooden box, nearly cubical in its dimensions, and capable of holding nearly 3 gallons, with a revolving dasher inside, turned round by a crank handle on the outside, a lid to fit closely on the top of the box, and a spigot and forcet aperture at the bottom of one of its sides. The dasher is very nearly equal in length to the internal dimensions of the box, its two ends sweeping close to each portion of the box within its range. It is similar to a double box or shallow drawer, having, on each side of it, narrow rectangular grooves or cells, and an iron axle through its centre, communicating with the handle outside. Before use the churn is scalded out, and the cream being warmed to about 62½° of Fahrenheit, it is poured into the churn to not more than half its depth. The lid is then closely pressed down perfectly tight upon the churn, and the dasher kept in rapid but uniform revolution by turning the handle. At the end of 8 minutes the operation is completed; and, from 5 quarts of cream, 5¼ lbs. of fine fresh butter is produced. The peculiar action of this churn appears to consist in the mechanical mode in which atmospheric air is rapidly brought, at a given temperature, into most intimate contact and compression with the cream. By a single revolution of the handle, the box-dasher is brought down upon the surface of the cream in a position nearly parallel to that surface, as the churn is only half full of the cream, which accordingly is on a level with the axle of the dasher. When the dasher thus enters the body of the cream, it carries with it the air enclosed in its under cells or rectangular partitions, while the cream fills the partitions on the opposite and upper side of that end of the dasher. As the dasher passes down through the cream, it presses by its rotary action the included air upon the cream immediately in contact with it; but as the dasher, in the course of its revolution, rises through the cream on the other side of the churn, the included air gradually escapes, and bubbles up through the cream; while the cells on the upper side being filled with cream, and carried to the upper part of the churn, the cream is dashed out, and falls down through the body of the churn. This combined mechanical action being constantly kept up, it may easily be conceived in how intimate a manner, and in how short a time, the atmospheric air is brought into contact with every portion of the cream, and the result of churning effected. The butter is then washed in the churn, without being touched with the hands. Nothing, as it appeared, could be more simple in its construction than this churn, or more decisive in its result; and the agent only regretted, that instead of providing himself, as he thought it his duty to do, with the cream for the operation, he had not requested the Council to favour him by ordering the cream, at his expence, from some indifferent party, and by causing the churn to be worked by any person they thought proper to employ. It would then have removed all doubt that might exist respecting any peculiar mode of treating the cream or of working the churn. He expressed the satisfaction it would give him to be allowed to repeat the trial under those conditions.—The Council ordered their thanks to Mr. Key for the kind trouble he had taken in favouring them with this inspection and trial. The Secretary then read to the Council an extract from a report, made by the New York State Agricultural Society, and to which his attention had been kindly called by Mr. John Bethell, in reference to the entrance of time as an element in the due formation of butter. The report is contained in the last volume of the Transactions of that body, page 267. After detailing the trial of an atmospheric churn, producing butter in 7 or 8 minutes, with other similar churns used in America, Mr. Howard, the assistant-editor of the "Cultivator," who was present at the trial, says, "The atmospheric churn appears to operate on a correct principle, that of mingling the air with the cream; but we are not in favour of such *rapid* churning. Having formerly had some experience in making butter, we should prefer that the churning, for a quantity of 10 to 20 lbs. of butter or more, should be prolonged to 30 minutes at least. According to our experience, the best butter is not produced by a very short nor a very long period in churning. If it is churned too quickly, the separation is not complete, and the butter, besides being less rich, is deficient in quantity; if the process is continued too long, the butter is likely to be oily. We think our best butter-makers would decide that churning, for ordinary quantities, should occupy from 30 to 50 minutes." Mr. Johnson, Secretary to the New York Society, then adds to these remarks of Mr. Howard, the following observations. "We have conversed, in relation to this subject, with many of our best dairymen, and they agree with Mr. Howard, that the best time for churning butter is from 30 to 50 minutes. The proper temperature for producing the greatest quantity as well as the best quality of butter is from 58° to 60°."—Professor Way remarked on the construction of the churn, that it would probably be an improvement in the dasher, if, instead of its being made so as to strike the surface of the cream in a parallel position, it were divided into oblique segments, similar to the sails of a windmill, or the fans of a revolving ventilator.

Prize-Essay.—Mr. Pusey, M.P., Chairman of the Journal Committee, laid before the Council the reports of the judges on the essays sent in to compete for the prize of 30*l.* offered by the Society, for the best essay on the diseases of cattle and sheep, occasioned by mismanagement; and the sealed motto-paper, corresponding with the motto of the winning essay being opened by the noble Chairman, it was found that the successful author for this prize was Mr. William Floyd Karkeek, veterinary-surgeon, of Truro, in Cornwall.

Wheat-grubs.—Mr. Pendarves, M.P., having received last week from one of his tenants in Shropshire some specimens of grubs, then existing in great numbers in that part of the country, but unknown previously, which were committing great devastations on the blade and root of the young Wheat plant, but resisted lime, salt, soot, and the remedies usually applied for the destruction of such insects, they had been sent to Mr. Curtis, the distinguished entomologist, for the favour of his inspection, and the following report, addressed to the Secretary, had been kindly made by that gentleman:

"15th April, 1850.

"I am much obliged to you for the grubs, which I wish very much to breed, in order to ascertain the exact species, but I fear they have had such a shaking by the post, that few of them will be able to slip off their jackets, and change to pupæ. Will you do me the favour to inform Mr. Pendarves, that the larvæ he left with you will change to large gnats, probably to a species described and figured in my last report; and as Mr. Pendarves seems interested in this matter, I beg to refer him to the 'Royal Agricultural Journal,' vol. x., pp. 89 and 92, where I have expressed my belief that the corn crops suffer from the larvæ of a species of Tipula, especially on sandy and light soils; and these larvæ of Mr. Pendarves's are the offspring, I expect, of the identical gnat which is figured in Plate, letter V. (opposite to page 117), in the same volume of the Journal; the larvæ at figures 42 and 43 are the pupæ at figure 44. This, I hope, will prove satisfactory; and if Mr. Pendarves be inclined to transmit me some more larvæ, in damp moss in a small tin box, which may be safely transmitted by post, I shall be happy to endeavour to rear them, and send you the results.

(Signed) "John Curtis."

The Council ordered their thanks to Mr. Curtis for the favour of this kind attention to the objects of the Society.

Mr. Fisher Hobbs has also received from a friend of his in the neighbourhood of Colchester, similar grubs from a 9-acre field of Wheat in that neighbourhood, much injured by their ravages, to the extent of nearly half the crop. The grubs attack the centre of the root of the plant.

Australian Barley.—Mr. R. W. Baker having transmitted details connected with his trial of the Australian Barley received by the Council a few years ago, and distributed among such members as kindly undertook to try and report upon its qualities, Mr. Pusey, Mr. Raymond Barker, and Mr. Fisher Hobbs, favoured the Council with their views on the general question of the trial of naturalised Barley, and the comparative mode by which its qualities ought to be tested by cultivation in this country along with the best ordinary varieties, and under precisely the same circumstances.

Asphaltic Manure.—Mr. John Bethell requested leave to put a question to the noble Duke before he quitted the chair. He had for some years been much interested in the conversion of bituminous substances into manure, but he had hitherto failed in obtaining a clue to any means by which their application in that respect could be made successful. He had accordingly learned, with much interest, from the communication made by Earl Grey to the Society a short time ago, that the Earl of Dundonald had succeeded in the attempt to render the pitch of the Asphaltic Lake in Trinidad beneficial as a manure, and had tested its value as such in the

Government gardens at Bermuda. Specimens of this bituminous manure were in the hands of Professor Way for analysis, and the results would, in due time, no doubt be laid before the Council; but as he had much doubt whether that analysis would inform us of more than we might anticipate from the probable nature of the compounds, he felt a great desire to hear what proofs Lord Dundonald had to offer of the excellence of the manure so prepared; and he begged to inquire of the noble Duke whether such communication had been received.—Mr. Pusey, M.P., stated that he had already anticipated Mr. Bethell's wishes on this subject, having written to Lord Grey to make a similar inquiry, when his Lordship had informed him that such communication was on its way from Lord Dundonald, and when received would be forwarded to the Council. Mr. Pusey took that opportunity of stating the interest he too felt on this question, though on grounds different from those stated by Mr. Bethell, namely, from cases in which increased fertility could apparently be due only to casual admixture with bituminous matter in the soil. This had been found to occur on some property of his relative's, the Earl of Carnarvon's, in Wiltshire, not far from his own residence at Pusey, where dark blue clay had been thrown over the land, and had exerted a manuring effect that could only be attributed to the bituminous matter the clay in question was known to contain.

Mr. John Martin, K.L., the celebrated artist, presented to the Society his work on diverting the sewage of London and Westminster from the Thames, and applying it to agricultural purposes; on improving the navigation of the river; and on establishing a supply of pure water to the metropolis.—Messrs. Blackie and Son, of Glasgow, presented the first division of the "Cyclopædia of Agriculture" (edited by Mr. J. Chalmers Morton, so well known to the Society and the public, as a distinguished writer on agricultural subjects).—Mr. Bruce Allen presented his Rudimentary Treatise on Cottage Building.—For all of which the Council ordered their usual acknowledgments to be conveyed.

The Council then adjourned to Wednesday next, the 1st of May.

Calendar of Operations.

APRIL.

East Lincolnshire Farm, *April* 22.—We have just succeeded in getting in our spring corn, and are now finishing sowing Grass seeds on the Wheat (which is much improved by the harrowing), and rolling our Barley, which looks promising. The lambing season is now over (excepting a few stragglers), and it has been altogether a tolerable one; that is, we have been as fortunate as our neighbours. About five or six ewes were lost, and there have not been so many pairs as usual. The greater part of the ewes and lambs are on a piece of seeds; the hogs finished their Turnips the first week in this month, and removed to Grass. About 200 (wethers) we are getting fresh, with oilcake, half a pound each per day, and will, perhaps, be kept on till shearing. We have wintered 18 beasts, bought last fall at 9*l.* 15*s.* per head, and though living well on Turnips and cake, they would not fetch at last fair 11*l.*, so that they will stay over a little longer. Prices at last Saturday's Caistor fortnight market were lower than ever; a good cow and calf might be bought for 9*l.* to 10*l.*, best fresh beasts, 11*l.*, best hogs, 31*s.*, very prime, 35*s.* Potatoes were selling at 8*d.* a peck, and butter at 9*d.* a pound. *H. E.*

Notices to Correspondents.

Account Books: *W B H.* The English Agricultural Society have published account-books. You should apply to their stationer; his address may be ascertained at No. 12, Hanover-square. The article "Accounts," in Blackie's "Cyclopædia of Agriculture," is worth reading. We hope to be able to describe the churn referred to next week.

Bantams: *Amateur.* The "black sickness" from which your birds are suffering is believed to be highly infectious in its worst stages, although it may only be epidemic in the earliest. Be cautious of handling the suppurating parts if you have a cut or cracked finger. Look well that the accommodation for your fowls be clean, warm, and airy. They may probably require to be crammed to keep them alive, for which purpose the pellets used for goslings are convenient. Dip them in water before administering, to make them slip down easily. For further details see "Dixon's Poultry," 2d edit., p. 255.

Bones and Acid: *G F M.* Pile the bone-dust in a heap and soak it with water, then pour the acid (one-fourth or one-third the weight of the dry bones), on the heap, and see that it does not run away unused from the heap. This will not be difficult to hinder, but it may be well for the purpose to lay a thick rim of ashes around the heap of bones on the earthen floor. When the boiling and effervescence have somewhat subsided, cover the heap over for a fortnight with the ashes, and after that turn it over and mix it well with enough dry ashes to make it drill.

Brain's Artificial Manures: *J L.* We do not know Mr. Brain's address. If he should see this perhaps he will be good enough to inform us.

Cabbages: *Sigma.* The Cabbages can hardly be expected to survive the suffocation between the rows of Beans. We very much doubt if the Turnips will come to much, unless they be sown very late.

Cow: *J C, Southton.* The supposed cause could not have had any influence in preventing the return of the natural instinct. Try stimulating food, such as Beans, and the following by way of medicine in a mash—Cantharides powdered, 5 grains every alternate day. *W. C. S.*

Emigrants: *B B.* It would be very unsafe to take any advice but that of those who have themselves been out. Perhaps some of our readers may be able to say where in N. America a capital of 500*l.* is likely to be most advantageously invested in agriculture.

Hose for Liquid Manure. *Subscriber.* Mr. Browne, of Hampen, Andoversford, Gloucestershire, is making Flax hose, which will bear a little pressure per yard, for conveying liquid manure, at 2*s.* per yard without seam. It is 2½ inches diameter; for 3*d.* per yard additional he puts on a composition that will secure it from decay. He is taking out the water from his Flax tanks with it, and intends with a force-pump to water some of his best crops this year. He is making a stronger hose for 2*s.* 6*d.* per yard for the London brewers and fire-engines, but he uses the one he sells at 2*s.* per yard himself.

Italian Rye-grass: *E D.* It will succeed among the Oats, but not among the Vetches. The latter will most likely kill it. It was so in our case once.

Kohl Rabi: *R F.* Mr. Hewitt Davis has strongly recommended it; and the following passage is extracted from an article by him in our volume for 1847: "My practice is to prepare a seed-bed by well digging and dressing in the winter a corner of my earliest piece of Tares. The seed is sown early in March thinly, in rows 12 inches asunder, and kept perfectly clean by hoeing and hand-weeding; and as the Tares are cleared off in May and June, the ground is deeply ploughed, ridged up, and dressed and planted. The plants at first are placed out 3 feet apart, the ridges being 28 inches asunder; but as the season advances, the distance between the plants is diminished. The value of this root, I assure your readers, in any season, is very considerable, but more particularly after a dry summer, when most other winter food is scarce. I am this year very fortunate, having on each of my farms a considerable breadth. Lean stock, after such a season as we have just had, always sells low in the autumn, from the want of winter keep, whilst fat stock in the following spring, from the same cause, usually sells very high, so that a plant of this description is most advantageous. Upon a field of 10 acres, broken up from heath last year (part of Bagshot-heath), I have at this moment more winter food to the acre than is commonly grown on good soils in favourable seasons, and this, too, has been raised without the aid of any purchased manure."

Legal Redress: *R W P.* You may obtain whatever the agreement with your tenant or the custom of the country implies. But on this subject you must consult your solicitor.

Peruvian Guano: *Bolton.* Average of 32 specimens, according to Mr. Way, is—

	Per cent.
Water	13.09
Organic matter and salts of ammonia	52.61
Sand	1.54
Earthy phosphates	24.12
Alkaline salts	8.78
	100.14

The organic matter named above contains ammonia corresponding to a per centage of 17.41 in the guano.

Spent Bark: *B W.* You had better either char it and then use it in compost with other manures, or make use of it as a sponge to hold liquid manure. You had better not apply it by itself in any large quantity to land; but if you soak it with tank water and turn it over two or three times it will do to use on any sort of soil at the rate of 20 cubic yards per acre, just as you would use farm dung.

Situations: *A A.* We have known inquiries to be made for managers for West Indian estates. Your best plan will be to advertise.

Stamps: *Borrower of Money.* We are not learned in the law, or should have been glad to inform you.

Stone Paper: *S R H* asks, "Has the new German 'stone paper' found its way to England yet, and how does its cost stand relatively to other coverings, such as the felt, &c.?" We have not any personal experience of felt as a covering for roofs, having preferred pantiles.

Yews: *H.* The Yew tree is extremely poisonous to horses, cows, and sheep when eaten in a dry or withered state. The writer has known many instances of animals having been thus poisoned. *W. C. S.*

Markets.

COVENT GARDEN, April 27.

Vegetables are well supplied, but many kinds of winter Fruit are over. Strawberries and Hothouse Grapes are both more plentiful, and the same may be said of Pine-apples, of which some good fruit may be obtained. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. Amongst Vegetables, Turnips and Carrots are good, and there is some very good Broccoli in the market. A few frame Potatoes have made their appearance. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Lemons, per doz., 1s to 2s
Grapes, hothouse, p. lb., 10s to 15s	Almonds, per peck, 6s
— Portugal, p. lb., 9d to 1s	— sweet, per lb., 2s to 3s
Strawberries, per oz., 4d to 1s	Walnuts, p. 100, 1s 6d to 2s
Pears, per doz., 6s to 10s	— p. bush., 16s to 24s
Apples, kitchen, p. bsh., 4s to 6s	Nuts, Bar., p. bush., 20s to 22s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 90s to 100s p. 100 lbs
— per 100, 5s to 12s	

VEGETABLES.

French Beans, p. 100, 1s 6d to 3s	Onions, p. bushel, 3s 6d to 4s 6d
Seakale, per punnet, 1s to 2s	— Spanish, p. doz., 1s 6d to 4s
Asparagus, p. bund., 2s to 7s	Shallots, per lb., 4d to 8d
Rhubarb, p. bundle, 6d to 1s	Garlic, per lb., 4d to 8d
Cabbages, per doz., 1s to 1s 6d	Lettuce, Cab., p. sc., 4d to 9d
Cauliflowers, p. doz., 1s to 4s	Endive, per score, 1s 6d to 3s
Broccoli, p. doz. bundl., 8s to 10s	Mushrooms, p. pot., 9d to 1s
Greens, per doz., 3s to 4s	Small Salads, per punnet, 2d to 3d
Sorrel, p. hf. sieve, 1s to 1s 6d	Fennel, per bunch, 2d to 3d
Potatoes, per ton, 60s to 120s	Savory, per bunch, 2d to 3d
— per cwt., 3s to 7s	Thyme, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Parsley, p. doz. bun., 2s to 3s
Turnips, p. doz. bun., 1s 6d to 2s 6d	— Roots, p. bdle., 9d to 1s
Red Beet, per doz., 9d to 1s	Marjoram, per bunch, 2d
Horse Radish, p. bdl., 1s to 4s	Mint, green, per bunch, 3d to 1s
Cucumbers, each, 1s to 3s	Watercress, p. doz. bunches, 6d to 9d
Leeks, per bunch, 1d to 1½d	Corn Salad, p. hf. sieve, 9d to 1s
Celery, p. bundle, 8d to 1s 6d	
Carrots, per bun., 4d to 6d	
Spinach p. sieve, 2s to 3s	

SMITHFIELD, Monday, April 22.

The number of Beasts is larger, and the average quality good. There is a good attendance of buyers, and late quotations are fully supported. The supply of Sheep is moderate; trade is brisk at advanced rates. Lamb is plentiful, and no dearer. The supply of Calves is quite equal to the demand; they meet with a dull sale at scarcely Friday's quotations. From Holland and Germany there are 326 Beasts, 330 Sheep, and 55 Calves; from Scotland, 400 Beasts; and 2500 from Norfolk and Suffolk.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	4 to 3	6	
Best Short-horns	3	0 — 3	4	
2d quality Beasts	2	8 — 3	0	
Best Downs and Half-breds	4	2 — 4	6	
Ditto Shorn	3	8 — 4	0	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	10 to 4	2	
Ditto Shorn	3	4 — 3	8	
Ewes & 2d quality	3	6 — 3	10	
Ditto Shorn	3	0 — 3	4	
Lambs	5	0 — 5	8	
Calves	3	4 — 4	0	
Pigs	3	0 — 4	0	

Beasts, 3658; Sheep and Lambs, 20,760; Calves, 126; Pigs, 230.

Friday, April 26.

We have a very large supply of Beasts to-day, and consequently prices are lower. The dead markets being, however, tolerably clear, a fair clearance is effected. The number of Sheep and Lambs is large; the former are sold about the same as on Monday last, but the latter do not maintain that day's quotations. Calves are very plentiful; trade is dull at lower prices. From Germany and Holland there are 102 Beasts and 195 Calves; from Scotland 500 Beasts; from Norfolk, 300; and 123 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	2 to 3	4	
Best Short-horns	3	0 — 3	2	
2d quality Beasts	2	6 — 2	10	
Best Downs and Half-breds	4	2 — 4	6	
Ditto Shorn	3	8 — 4	0	

Best Long-wools	3	10 to 4	2	
Ditto Shorn	3	4 — 3	8	
Ewes & 2d quality	3	6 — 3	10	
Ditto Shorn	3	0 — 3	4	
Lambs	5	0 — 5	6	
Calves	3	0 — 4	0	
Pigs	3	0 — 4	0	

ENGLISH TIMBER AND BARK.—April 27.

	Round Timber. Per Load.	Plank. Per Foot Cube.	Inch Board. Per Foot Superf.
Oak	£5 0 0 to £7 0 0	3*s.* 0*d.* to 5*s.* 0*d.*	0*s.* 4½*d.* to 0*s.* 6*d.*
Ash	4 0 0 — 6 0 0	2 3 — 3 0	0 3 — 0 4
Elm	2 10 0 — 3 10 0	1 6 — 2 0	0 2 — 0 3
Beech	2 5 0 — 3 0 0	1 6 — 2 0	0 2 — 0 2½
Lime	3 0 0 — 4 0 0	2 0 — 2 6	0 3½ — 0 4½

Bark per load of 45 cwt. is from 13*l.* to 15*l.* We have to note a decline of 20*s.* to 30*s.* per load in old English during the past month; some large parcels are now in the market.

POTATOES.—Southwark, April 22.

The Committee report that the fresh arrivals during the past week have been limited, which has enabled salesmen to commence selling out of stores, but prices are very little better. The following are the present prices:—York Regents, 100*s.* to 120*s.* per ton; Scotch whites, 40*s.* to 45*s.*; French whites, 40*s.* to 65*s.*; Belgian do., 40*s.* to 55*s.*; Rhenish do., 50*s.* to 65*s.*; Dutch, 35*s.* to 40*s.*

HAY.—Per Load of 36 Trusses.

Cumberland Market, April 25.

Prime Meadow Hay	68*s* to 72*s*		Inferior		60*s* to 70*s*
Inferior ditto	50	63	New Clover	—	—
New Hay	—	—	Straw	24	28

New Hay	—	—	Straw	22	25
Old Clover	80	84			

HOPS.—Friday, April 26.

Messrs. Pattenden and Smith report that there is a steady trade doing in new Hops, as well as fine yearlings, at the following prices:

Mid. and East Kents	p. cwt. 147*s* to 252*s*	Farnhams, p. cwt.	—*s* — —*s*
Weald of Kents	126 — 147	Yearling Kents	40 — 80
Sussex	110 — 130	Yearling Sussex	40 — 80
		Old Hops	20 — 60

MARK LANE.

Monday, April 22.—The supply of English Wheat by land carriage samples to this morning's market was very small, and disposed of at the prices of this day se'nnight. Foreign met an improved inquiry at the prices of Friday last.—Barley of all sorts is fully as dear, as are also Peas.—We raise our quotations for Mazagan Beans 1*s.* per qr., and other qualities meet a better sale.—Oats are in more general demand, at rather enhanced prices.—The top price of English Flour is lowered 1*s.* per sack, namely to 37*s.*

Friday, April 26.—The arrivals of foreign Barley and Oats this week are large, but moderate of Wheat and English corn. The attendance at this morning's market was small, and business limited. Foreign Wheat, however, was held with more firmness, and where sales were effected late prices were fully supported; English remains as last quoted. We observe no alteration in the value of Barley, Beans, or Peas.—The Oat trade is heavy, and inferior qualities difficult of disposal, excepting at a decline of 6d. per qr. on Monday's prices.—Since the 19th inst. an improved feeling has manifested itself for Wheat, both here and in many provincial markets. The value of good qualities has been fully supported, although much difficulty still attends the disposal of inferior and out-of-conditioned parcels, which, in the interior, have in some instances been held at a decline. Barley and Peas are unaltered in value. English Mazagan Beans have rather improved, but foreign Oats are a trifle cheaper, the supply here continuing large.

Liverpool, Friday, April 26.—Since Monday last the arrivals of grain and Flour have been very insignificant. At this day's market the Wheat trade was more lively than of late, and a fair amount of business was transacted, partly on speculation, and chiefly on secondary runs of foreign, which realised an advance of 1d. to 2d. per 70 lbs. on Tuesday's rates. Barley was a dull sale, and rather cheaper. There was no change in Malt, Beans, and Peas. Oats were in moderate request, and a shade dearer. Oatmeal was steady at late prices.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, May 1, and THURSDAY, May 2, at 12 o'clock, a first-rate collection of CARNATIONS and PICOTEES; also the newest varieties of Dahlias, Heartsease, Fuchsias, Verbenas, and other plants in bloom.—May be viewed the morning of Sale. Catalogues had at the Mart, and of the Auctioneers, Leyton-stone, Essex.

DAHLIAS, VERBENAS, GERANIUMS, CARNATIONS, PICOTEES, BLACK AND GREEN TEA TREES IN POTS, HERBACEOUS PLANTS, ROSES, &c.

MR. HASLAM will sell by Auction, as above, at the Auction Mart, on WEDNESDAY, May 1, and FRIDAY, May 3.—Catalogues may be had at the Mart, and of the Auctioneer, Epping, Essex.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in THE GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

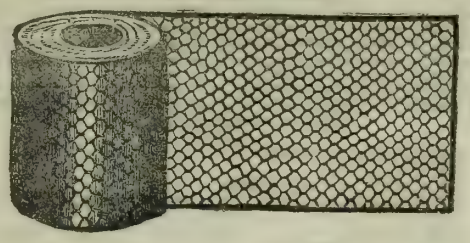
W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works Greenwich.

TO FLORISTS, HORTICULTURISTS, &c.



MORRELL'S REGISTERED FLOWER LABELS are ready for delivery in any quantity; they will be found unimpaired by any change of weather, either of heat, cold, wet, or dry, and therefore suitable for the Stove, Hot-house, Greenhouse, or the open ground; also his improved Flower Sticks, of various lengths, from 12 inches upwards. —May be had of most Seedsmen and Ironmongers in town and country; and wholesale at 149, Fleet-street, London.

CHEAP AND EFFECTIVE FENCE AGAINST HARES AND RABBITS.—Iron Wire Netting of various patterns, to exclude the smallest Rabbits, in coils of 50, 100, or any given number of yards, at prices varying from 4d. to 1s. per yard run. Aviary Net at proportionate prices. None sent out without at least two coats of the best Anti-corrosive Paint. Testimonials of the highest and most respectable character, received during the last 13 years, enable the Advertiser to speak with confidence as to the excellence of the article.—Apply to Mr. SAMUEL TALYOR, Barnwood, near Gloucester; or to ROBERT WOODCOCK, at the Manufactory, Stoke Ferry, Norfolk.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, and more durable and elegant than any other Fence hitherto introduced.

COPPER WIRE HOTHOUSE SASH LINE.

LIGHTNING CONDUCTORS.

GILT AND PLATED CORD FOR HANGING PICTURES.

Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.

2d. It is portable, being packed in rolls, and not liable to damage in carriage.

3d. It effects a saving of half the timber usually required.

4th. It can be easily applied by any unpractised person.

5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.

Price One Penny per Square Foot.

CROGGON and Co.'s PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.

Samples, testimonials, and full instructions, on application to CROGGON and Co., 2, Dowgate-hill, London.

SEATON, COAST OF DEVON.

TO BE LET, unfurnished, with immediate possession, by the year, or for a term, the MANOR HOUSE, containing spacious Dining and Drawing-rooms, 10 Bed-rooms, Kitchens, and other offices, with Coach-house, Stables, and Garden; also the right of Shooting over about 700 acres of preserved land. Situated between Lyme and Sidmouth, on a picturesque and healthy part of the south coast of Devon.—To view, apply to Mr. JAMES MAJOR, Seaton; and for further particulars to Mr. BABBAGE, Nettlecomb, near Taunton; or to Mr. JOHN HARE, House-agent, Taunton.

FOR INVESTMENT OR OCCUPATION.—A most eligible FREEHOLD ESTATE, containing nearly 700 acres of Arable, Pasture, and thriving Wood Land, situate about 18 miles from London, and a short distance from a Railway Station and two excellent Market-towns. Large sums of Money have lately been expended in Draining and in erecting new Buildings on the Estate, on many parts of which are most eligible spots for the erection of a gentleman's residence.—This property would form an excellent investment for a gentleman fond of agricultural pursuits. The Game on the Estate is abundant.—Letters from gentlemen seeking such an investment may be addressed, prepaid, to Mr. EDMUND JOHN JENINGS, Attorney-at-Law, 1, Mitre-court Buildings, Temple, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DR. NEWINGTON'S HAND-DRILL HOES, with their various fittings; Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles, Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. DUPAUR and Co., Agricultural Depôt, 21, Red-lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

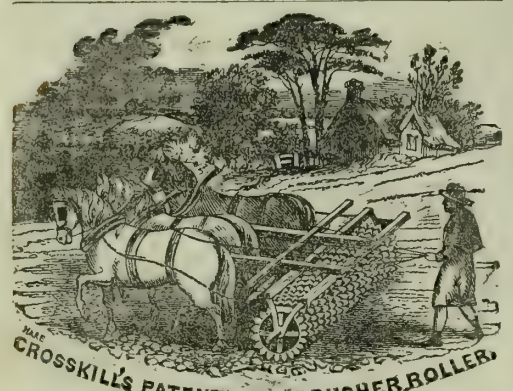
HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12s. to 13s. per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.



THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED, and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs, EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

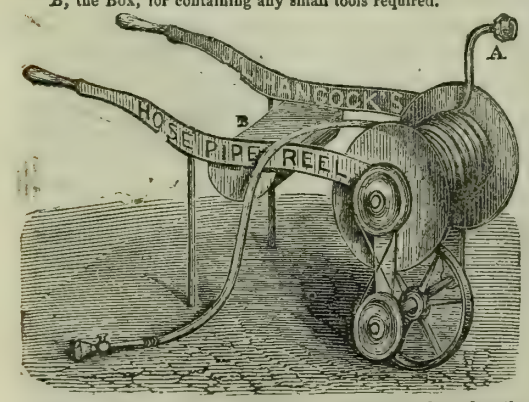
EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

CROSSKILL'S PATENT ROLLER.—For Rolling Spring Wheat, Growing Crops, Grass Lands, Compressing Soft Soil, and Crushing Clods. Prize Patent Wheels, Carts, and Waggons—awarded 30 sovs. prizes at Norwich. Prize Portable Farm Railway, will pay its cost the first year, &c. &c. On receipt of six penny postage stamps, a new Illustrated Newspaper and Catalogue will be sent gratis per post, with full particulars of the newest and best Field, Road, and Barn Implements, now kept in Stock, for delivery from Hull by water or rail to all parts of the kingdom.

Address Mr. CROSSKILL, Iron Works, Beverley.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London-bridge.



FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.

B, the Box, for containing any small tools required.

J. L. HANCOCK invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

On the 30th instant will be published (to be continued Monthly with the Magazines), price 2*d.*, or Stamped 3*d.*,

THE HOUSEHOLD NARRATIVE OF CURRENT EVENTS.

BEING A MONTHLY SUPPLEMENT TO "HOUSEHOLD WORDS;" CONDUCTED BY CHARLES DICKENS.

OFFICE, 16, WELLINGTON STREET NORTH, STRAND (where Prospectuses may be had), and all Booksellers.

Just published, the Second Edition, with Additions, 5*s.* 6*d.* cloth,

ORNAMENTAL AND DOMESTIC POULTRY;

THEIR HISTORY AND MANAGEMENT.

By the Rev. EDMUND SAUL DIXON, M. A., Rector of Intwood with Keswick.

"It will be found a useful and intelligent guide to the poultry keeper, while the lively and often amusing manner in which it is written gives it a claim upon the attention of the general reader."—*Midland Counties Herald.*

"This book is the best and most modern authority that can be consulted on the general management of Poultry."—*Stirling Observer.*

Published by JAMES MATTHEWS, at the Office of the GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE, 5, Upper Wellington-street, Covent-garden; and may be ordered of any Bookseller.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence; not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

DRAINAGE AND IRRIGATION.

MR. HENRY WEBBER begs to inform the Landowners and the Public generally that he is prepared to enter into contracts for Draining and Irrigating Lands, which he will undertake to effect upon the most modern principles, having had considerable experience in conjunction with his father Mr. Thomas Webber, of Halberton-court, the Government Inspector of Drainage.—Any communications addressed Mr. H. WEBBER, Halberton-court, near Tiverton, Devon, will be promptly attended to; and all orders executed with a due regard to economy and efficiency.

NEW WORK ON GARDENING AND BOTANY.

On the 30th will be published, price 2*s.* 6*d.*, No. III. of

PAXTON'S FLOWER GARDEN.

Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Woodcuts.

This Work, for which Monsieur CONSTANS, a French Botanical Draughtsman of great taste and skill, and a pupil of Mons. Decaisne, has been expressly engaged, will be confined to the proper business of an illustrated book, namely the representation and description of all new plants which may appear in gardens. The species which are of most importance will be illustrated by coloured plates, one species or genus only to a plate, with a leaf or more of letter-press, explaining the principal scientific and horticultural facts which belong to each plant. The species of less importance will be treated of more briefly, and will be illustrated when necessary by copious woodcuts and vignettes. The object, in short, will be to combine Scientific Botany with Gardening, and exact delineations of plants with pictorial effect. It is believed that by such means this periodical will not only be indispensable to the BOTANIST and GARDENER, but be also a mine of invaluable hints by which the ARTIST and MANUFACTURER will be able to profit.

It is not intended to admit any other kind of matter than such as is now described. All special treatises on cultivation, and all disquisitions respecting subjects incidental to gardening, will be transferred to the *Gardeners' Chronicle* and similar periodicals, in which there is ample space for such discussions, and to which they have now become better adapted than to a pictorial work.

London: BRADBURY and EVANS, 11, Bouverie-street.

A COMPREHENSIVE ATLAS OF PHYSICAL GEOGRAPHY.—Constructed by A. PETERMANN, F.R.G.S., with Descriptive letterpress, embracing a general view of the Physical Phenomena of the Globe, by the Rev. T. MILNER, M.A., author of the "Gallery of Nature," &c. 1 vol., imperial 4to, cloth, 21*s.*

London: WM. S. ORR and Co., Amen Corner.

THE STANWICK NECTARINE.

MR. J. C. STEVENS has the honour to announce that on WEDNESDAY, May 15, at 12 for 1 o'clock, by order of His Grace the DUKE OF NORTHUMBERLAND, and on account of the Trustees of a Fund for the Benefit of the GARDENERS' BENEVOLENT INSTITUTION, he will offer for sale by Auction, in his Great Room, 38, King-street, Covent-garden, Twenty-four Plants of the celebrated STANWICK NECTARINE. These plants are in pots, have been propagated expressly for the Charity by Mr. RIVERS, of Sawbridgeworth, and are the first specimens that have been offered for sale.

On the same day will be sold about 150 dwarf Apples, in 6-inch pots, grafted on the Pomme de Paradis (identical with the dwarf Apple of Armenia); many of them are in a bearing state, and very interesting little trees.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

THE FIRST EXHIBITION OF PLANTS AND FLOWERS this season will take place on WENDESDAY next, May 8th. Tickets to be obtained at the Gardens only by orders from Fellows of the Society, price 5*s.* each, or on the day of Exhibition, 7*s.* 6*d.* N.B. The gates open at 2 o'clock.

TWO HUNDRED POUNDS IN PRIZES.

THE GRAND MONSTER HORTICULTURAL AND FLORAL EXHIBITION
WILL BE HELD IN CHELTENHAM,
On THURSDAY, the 20th of June, 1850, in the Spacious Hall and Pavilion of the ROYAL OLD WELLS.

The SHOW is open to all Exhibitors, and without Entrance Fees. The following List includes a few of the principal Prizes:—Stove Plants (exclusive of Orchidaceæ), best Ten—1st, 12*l.*; 2d, 6*l.*; and 3d, 3*l.* Best Six Ditto, 5*l.*, 2*l.* 10*s.*, and 1*l.* Orchidaceous Plants, best Eight, 12*l.*, 6*l.*, and 3*l.*; best Four Ditto, 5*l.*, 2*l.* 10*s.*, and 1*l.* Greenhouse Plants, best Twelve, 10*l.*, 5*l.*, and 2*l.* 10*s.*; best Six Ditto, 4*l.* and 2*l.* Heaths, best Six, 7*l.*, 4*l.*, and 2*l.* Bulbs, best Six, 7*l.* and 3*l.* 10*s.* Pelargoniums, best Twelve, 8*l.*, 4*l.*, and 2*l.* Roses, best Eighteen, cut, distinct varieties, 6*l.*, 3*l.*, and 1*l.* 10*s.* Best and Newest Plant in bloom, 3*l.*; ditto, in or out of bloom, with the most remarkable foliage, 2*l.* A great number of Prizes for Specimen and Herbaceous Plants, Pinks, Pansies, Fuchsias, Fruit, Vegetables, &c., included in the Schedules, which may be had on application to the Hon. Secretaries, H. W. MILLETT, Esq., and Mr. J. TAGART, Cheltenham.

GARDENERS' BENEVOLENT INSTITUTION.—The SEVENTH ANNIVERSARY DINNER in aid of the Funds of this Society will be held at the London Coffee-house, Ludgate-hill, on WEDNESDAY, 15th inst., the Right Hon. the EARL OF CARLISLE in the chair.

STEWARDS.

His Grace the Duke of Northumberland	Henry Thomas Hope, Esq., M.P.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

JOHN B. SMITH begs to inform the Nobility, Gentry, and the Trade, that his superb Collection of Yellow RHODODENDRONS, AZALEA INDICAS, &c., are now coming into bloom, and will continue throughout the present month.

Norbiton Nursery, Kingston, May 4.

TO ENGLISH GENTLEMEN, AMATEURS, AND NURSERYMEN.

MR. J. DE JONGHE, 20, Rue Visitandinen, Brussels, has now ready to send out the beautiful new plant FRANCISCEA EXIMIA, received from the Province of St. Paul, Brazil, and which received the first prize for new and rare plants at the exhibition of the Royal Floricultural Society at Brussels, the 6th of March, 1849. This truly splendid plant has been considered by connoisseurs to be the best Franciscea introduced; the foliage is good, the flowers large, and of the most exquisite violet blue. It flowers from March till June, is easy of cultivation, and blossoms profusely.

Strong 3-year-old plants	...	...	£6 0 0
Do. 2-year-old	do.	...	4 0 0
Good 1-year-old	do.	...	2 0 0

Unknown correspondents are requested to forward the amount through Messrs. GRINDLEY and Co., 18, Cornhill, London.

UNRIVALLED SEEDLING ANTIRRHINUMS.

JAMES SAUNDERS AND SON having paid particular attention to the cultivation of the above beautiful hardy plant, have much pleasure in offering a selection of 12 from their large and universally admired collection. They will be found perfectly distinct, and cannot fail to give the utmost satisfaction. Fifty spikes of flowers were sent to Dr. LINDLEY, who describes them thus in the *Gardeners' Chronicle*, July 14, 1849:—"*J. S. A.* A very handsome collection, particularly Nos. 3, 5, 16, 19, 18, 24, 25, 27, 31, and 42, but still more particularly Nos. 5 and 42. No. 28 is a very bright self-coloured yellow. You had better select the most distinct striped and spotted ones for seed. Yours is an excellent breed of Antirrhinums for that purpose."

Blooms were also sent to and seen by a great many Nurserymen and Florists, and in every instance received the same admiration, as superior in every respect to any out, and were in all cases ordered. Many of them are beautifully spotted, others as finely flaked as any Carnation, and the whole collection brilliant in every variety of colour, perfect in shape, free bloomers, and of compact habits.

Strong plants will be sent out on and after the 6th of May, at 30*s.* the set of 12; one-third off to the Trade when three or more sets are ordered. They can be forwarded safely by post, and, when ordered so, free of postage.

J. S. and SON have also a fine Stock of Antirrhinum Seed, carefully selected from 50 of their best varieties, in packets, 2*s.* 6*d.* to 5*s.* each, free by post.—Abergavenny, May 4.

DAHLIAS—NEW AND CHOICE VARIETIES AT REDUCED PRICES.

WM. DENYER, SEEDSMAN and FLORIST, 82, Grace-church-street (near the Spread Eagle), London, has just published his Annual Descriptive List of DAHLIAS, containing all the new and most approved show varieties. The new varieties, 12*s.* to 18*s.* per doz.; the older kinds, but good sorts, 6*d.* each, or 5*s.* per doz.

Catalogues may be had on application.

W. D. has just received, from an eminent German grower, the following, which may be had in small collections:

Autumnal Stocks, 6 brightest colours; the collection,		1*s.* 6*d.*

The set 22*s.* 6*d.*; usual allowance to the Trade.

Those marked † can be sent free by post if required.

Goods sent carriage free to London, and with all orders of 40*s.* and upwards extra plants presented. Remittances requested from unknown correspondents. Post-office orders to be made payable to BASS AND BROWN, or STEPHEN BROWN.

Seed and Horticultural Establishment, Sudbury, Suffolk.

HORTICULTURAL IMPROVEMENTS.

STRAWBERRIES exceeding two ounces each in weight, and of delicious flavour, were grown on Roberts's Strawberry Tiles last season, and exhibited at the Horticultural Show at Chiswick, and at the Royal Botanic Gardens, Regent's Park, where they obtained the highest Certificate of Merit. No appliances hitherto used are equal to these Tiles for improving the flavour and keeping the Strawberries clean. This is admitted by all who have tried them. As a further proof, many persons who have tried them have had a second and third supply, and will have much pleasure in answering inquiries, if any reference is considered necessary. They are not like articles of consumption, for when once purchased they will last for many years.

CELERY and CARDOONS of the most superb quality and size were produced by the use of Roberts's Sockets, and this season he introduces a new method of growing Asparagus, which greatly improves the quality and quantity of that valuable vegetable. He likewise gives a new mode of growing Grapes, Peaches, Figs, and other Wall Fruit, and has recently registered a Ventilating Flower Pot, which will be found invaluable to Scientific and Amateur Gardeners.

An illustrated pamphlet, with particulars and testimonials, can be had by enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London, where these inventions may be inspected.

FERN SEEDS.

GEORGE BENNET begs to inform the lovers of Ferns that he has still a large quantity of NEW ZEALAND FERN SEEDS; and has much pleasure in announcing that they have vegetated. Price 2*s.* 6*d.* per packet. The names of the varieties are as follows: No. 1, Todia sp., variety australis; No. 2, Alsophylla medullaris, fine variety; No. 3, Cyathea dealbata; No. 4, mixed varieties of Hymenophyllum, Trichomanes, Adiantums, &c.; No. 5, mixed varieties of Alsophylla dealbata, or Silver Tree Fern; No. 6, Cyathea medullaris. A remittance must accompany the order either in postage stamps or Post-office order, made payable at Coventry, to GEORGE BENNET, Brandon, Warwickshire, near Coventry.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

GRASS SEEDS.—Mixtures of selected natural GRASS SEEDS, with a proper proportion of permanent Clovers, for laying down land to permanent Meadows and Pastures, to suit the soil to be laid down. Mixtures of the above for Irrigation or Water Meadows.

Mixtures of the above for Parks or Field Lawns; Italian, Perennial, and other Rye-grasses; Long Red, Yellow Globe, and other Mangold Wurzel; Swedes (various sorts), Hybrid and other Turnips; all kinds of Grass Seeds, Agricultural and other Seeds.—THOMAS GIBBS and Co., the Seedsmen to the Royal Agricultural Society of England, corner of HALF-MOON-STREET, Piccadilly, London.

CHEAP BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, will send out the following Bedding Geraniums, 3*s.* 6*d.* per dozen; all other kinds of Bedding Plants, 2*s.* 6*d.* per dozen. Geraniums sent out of pots, 2*s.* 9*d.* per dozen; all other kinds, 1*s.* 8*d.* out of pots. Descriptive Catalogues sent on the receipt of 1*d.* postage stamp.

FARNHAM CASTLE CUCUMBER.—Two Seeds of this stout Black Spine Cucumber will be sent, on the receipt of 12 postage stamps. May be grown 24 inches long. Twelve seeds of Prize-fighter, ditto, for 12 stamps.—May 4.

EDWARD BECK, SLATE WORKS, ISLEWORTH.
SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to offer the following Plants, which can be supplied immediately.

NEW BEDDING PLANTS.

Bouvardia leiantha, 5*s.*; Cuphea Donkelaarii, 3*s.* 6*d.*; Cuphea miniata speciosa, 5*s.*; Heliotropium corymbosum, 3*s.* 6*d.*; Lantana delicatissima, 2*s.* 6*d.*; Lobelia erinus maxima, 9*d.*, or 8*s.* per doz.; Lopezias villosa, 1*s.* 6*d.*; L. miniata, 1*s.* 6*d.*; L. miniata superba, 1*s.* 6*d.*; Petunia viridis marginata, distinct, 3*s.* 6*d.*; Bouvardia jacquini, rose-coloured tube, brilliant scarlet centre, free bloomer, 1*s.* 6*d.* and 2*s.* 6*d.*

SCARLET GERANIUM, "COMMANDER-IN-CHIEF," 10*s.* 6*d.* This splendid variety should be in every garden where a Geranium is grown, as it cannot be too highly recommended for public favour.

SCARLET GERANIUM, "EXCELLENCE," 7*s.* 6*d.* An allowance to the Trade on the Geraniums where three are taken.

Maurandya Emeryana, 2*s.*; Calceolaria sulphurea splendens, a splendid large yellow, and very fine for bedding, 5*s.*; Trentham scarlet Geranium, 3*s.* 6*d.*

NEW HERBACEOUS PLANTS.

Campanula nobilis alba, 7*s.* 6*d.*; Dielytra spectabile, 5*s.*; Scutellaria canescens, 5*s.*; S. macrantha, 3*s.* 6*d.*; Anemone vitæfolia hybrida, 3*s.* 6*d.*; Delphinium azureum plenum, 3*s.* 6*d.*; and Funkia grandiflora, 3*s.* 6*d.*

SELECT PLANTS.

Ceanothus dentatus, 5*s.*; C. rigidus, 5*s.* and 7*s.* 6*d.*; C. papillosus, 7*s.* 6*d.* and 10*s.* 6*d.*; Daphne Delahayana 7*s.* 6*d.*; D. Fortunii, 7*s.* 6*d.*; Centradenia floribunda, 7*s.* 6*d.* and 10*s.* 6*d.*; Hoya bella (Veitch's), 10*s.* 6*d.*; Hoya bella (continental variety), 10*s.* 6*d.*; Gesnera picta (Veitch's), 5*s.*; G. purpurea macrantha, 5*s.*; Hydrangea involucrata, 3*s.* 6*d.*; Gloxinia Victoria Regina, 7*s.* 6*d.*; Fuchsia Prince of Orange, Fair Rosamond, Don Giovanni, Sims Reeves, Pearl of England, Grand Master, and Confidence. The seven for 30*s.*, or 5*s.* each, with the usual discount to the Trade.

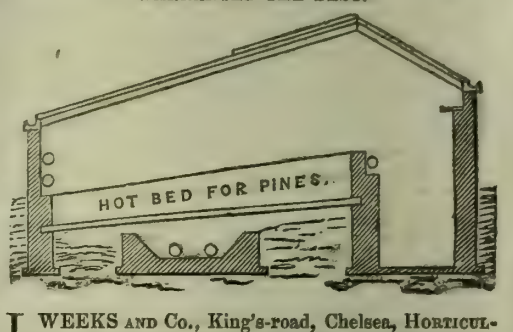
For descriptions of the above see last week's Paper.

N.B. Descriptive Priced Catalogues of all the new Bedding and Soft-wooded Plants, are just published, and will be sent on application.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.



Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.

J. WEEKS and Co., King's-road, Chelsea.

TO BE DISPOSED OF, the fine BED OF TULIPS possessed by the late Mr. JOHN RONALDS, of Brentford, either in the whole bed or separately. They will be in bloom after the 10th of this month (May).—Brentford, May 4.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

TO FLORISTS, HORTICULTURISTS, &c.

MORRELL'S REGISTERED FLOWER LABELS are ready for delivery in any quantity; they will be found unimpaired by any change of weather, either of heat, cold, wet, or dry, and therefore suitable for the Stove, Hothouse, Greenhouse, or the open ground; also his improved Flower Sticks, of various lengths, from 12 inches upwards.—May be had of most Seedsmen and Ironmongers in town and country; and wholesale at 149, Fleet-street, London.

WM. JAS. EPPS begs to offer the following Plants, which are well established, and in fine health. Having an extensive stock, he is enabled to offer them at the following reduced prices:

GERANIUMS, varieties of last season, in 4-in. pots		36*s.* per doz.	
Do., excellent varieties		12*s.* to 21*s.*	,,

Petunias, in fine variety, 4*s.* to 12*s.* per dozen.
Roses, fine variety of Tea, China, Bourbon, and Noisettes, 6*s.*, 9*s.*, and 12*s.* per dozen.
Phlox, the very finest ... ... 6*s.* to 12*s.* per dozen.
Verbenas, the best French and others ... 4*s.* to 12*s.* ,,
Verbena, "Lilac Defiance," a fine lilac, and perfumed; habit of Scarlet Defiance, admired and ordered by all who saw it in autumn; only a few plants to spare, at 5*s.* each.
Quantities of Bedding Plants, in assortments, 4*s.* per dozen; 25*s.* per 100.
Remittances are respectfully requested from unknown correspondents. Carriage of all parcels paid to London.
Sturmer Nurseries, Haverhill, Suffolk, May 4.

"SUNSET" VERBENA.

MESSRS. JEYES AND CO. have much pleasure in offering for Sale the above Verbena. The two eminent growers named below have described its character.

"Your Verbena 'Sunset' is quite distinct from any other scarlet. Its habit for bedding is the best we know of. The name is well applied, for a mass of its flowers has all the appearance of a declining sun.—DANIEL JUDD, Gardener to the Right Honourable Earl Spencer, K. G.; WALTER GREY, Gardener to the Right Honourable Sir James Parke."

Plants 5*s.* each; if two are ordered three will be sent.

P.S.—The Prices of the Rare Flower Seeds advertised and described in this Paper of March 9 are—Hibiscus speciosa, 2*s.* 6*d.*; Æthionema membranaceanum, 6*d.*; Myosotis azoricus, 2*s.* 6*d.*; Pentstemon Murrayanum, 2*s.* 6*d.*; Calandrinia umbellata, 2*s.* 6*d.* per paper.—Northampton, May 4.

RENDLE'S PRICED CATALOGUE OF PLANTS is JUST PUBLISHED, and can be had for one postage stamp.

Ever since our invention of the "Tank System of Heating Horticultural Buildings" (for which a Gold Medal was unanimously awarded to us by the Royal Devon and Cornwall Horticultural Society) we have been enabled to propagate plants in such abundance, with scarcely a failure, that we are enabled to offer them at

VERY REDUCED PRICES.

We shall have at least THREE THOUSAND DAHLIAS and FUCHSIAS ready for delivery after the 10th of May next, as well as a large quantity of Geraniums, Camellias, Indian Azaleas, Cinerarias, Verbenas, Antirrhinums, Chrysanthemums, with a large collection of Greenhouse, Hothouse, and Herbaceous plants, prices of which will be found in our new Catalogue, on application to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth. ESTABLISHED 1786.

STAR NURSERY, SLOUGH, BUCKS.

W. R. BRAGG begs to inform the Floral Public that his Annual Spring Catalogue contains Descriptive Lists of E. Foster's new and superlative Pelargoniums; the best varieties of Pinks, Picotees, Carnations, Pansies, Roses, &c., and may be had on application.

GIPSY PRIDE, by far the most successful Pelargonium of 1849, may still be had; also Constance, Conspicuum, Narcissus, Armida improved, and all the best show varieties of last and former years, in extra strong plants.

NEW PANSY, HUNT'S "HELEN," has gained more first class certificates in 1849 than any other variety now offered, and, beyond doubt, is quite a leading white-ground flower; plants are fine and healthy. 5*s.* each.

GOLDEN YELLOW DAHLIA, OLIVER'S "GOLDEN DROP," gained four first prizes and first class certificates in 1848, &c., five of each in 1849. Plants in May, 10*s.* 6*d.*

NEW FANCY DAHLIA, BRAGG'S "LADY GRENVILLE," the most successful fancy Dahlia of the year; colour, deep red, distinctly tipped with white; as a guarantee for constancy, it has received 11 first class certificates, four extra money prizes, and two premier prizes in class showing. Plants in May, 10*s.* 6*d.* Sound ground and pot roots of all the best Fancy and other Dahlias, at moderate prices.—May 4.

ANTIRRHINUMS UNEQUALLED.

EDWARD TILEY begs to inform the lovers of the above beautiful flower, that he will be ready to send out, after the 7th May, Five superb Seedling ANTIRRHINUMS, selected from above ten thousand seedlings. Ne plus ultra, 5*s.*; Lady William Powlett, 5*s.*; Criterion, 5*s.*; Lord Gough, 5*s.*; Major Edwardes, 5*s.*

The above varieties will be found to be very superior to anything of the kind yet sent out. They were admired by hundreds of spectators, and numerous orders were taken for them when in bloom. Blooms were sent to the Editor of the *Gardeners' Chronicle*, who spoke in the highest terms of them. "Ne plus ultra" was sent to Mr. Henderson, Pine-apple Nursery, who highly approved of it, and ordered plants. They are dwarf habited, and very free bloomers; large bold flowers beautifully striped with large flakes of various colours, some of them finely splashed and studded over on various coloured grounds, which give them a very attractive appearance—above all the older varieties. The set of 5 will be sent for 1*l.*

E. T. being a grower of all the best varieties, warrants them to give the greatest satisfaction to all purchasers. Parties living at a distance can have them sent through the post, carefully packed in stout boxes, postage and package free, on the receipt of Post-office order for the amount of plants required. A remittance or reference is expected from all unknown correspondents. The usual allowance to the trade when three plants are ordered.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath, May 4.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

The First Meeting will take place on SATURDAY, the 18th of May. Subjects for Exhibition must be at this Office on Friday the 17th, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition.

The Gates will be open to visitors at One, P.M. Tickets are issued to Fellows at this Office, price 5*s.* each, or at the Garden in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each; but then only to orders from Fellows of the Society.

N.B. No Tickets will be issued in Regent-street on the day of Exhibition. 21, Regent-street.

WORTON COTTAGE MEETINGS.—Raisers of seedlings and others will please to observe these meetings will not be held when the Metropolitan Exhibitions fall upon a Wednesday, as that of the Botanical Society does next week.

*** Flowers may be sent as usual for the opinion of the Censors of the "Florist and Garden Miscellany."

EDWARD BECK, Worton Cottage, Isleworth.

ZOOLOGICAL GARDENS, REGENT'S PARK.—Admission every day in WHITSUN WEEK, except Saturday, at SIXPENCE each person.

The Gardeners' Chronicle.

SATURDAY, MAY 4, 1850.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	May	6	Entomological	8 P.M.
			Chemical	8 P.M.
			Pathological	8 P.M.
			Medical	8 P.M.
			British Architects (Anniversary)	8 P.M.
TUESDAY,	—	7	Linnean	8 P.M.
			Civil Engineers	8 P.M.
			Royal Botanic Gardens	2 P.M.
			Literary Fund	3 P.M.
WEDNESDAY,	—	8	Society of Arts	8 P.M.
			Graphic	8 P.M.
			Ethnological	8 P.M.
			Geological	8 P.M.
THURSDAY,	—	9	Royal Soc. of Literature	4 P.M.
			Antiquarian	8 P.M.
			Astronomical	8 P.M.
FRIDAY,	—	10	Philological	8 P.M.
			Royal Institution	8 P.M.
SATURDAY,	—	11	Asiatic (Anniversary)	2 P.M.
			Westminster Medical	8 P.M.

COUNTRY SHOW.—Friday, May 10: Stamford Hill Horticultural.

THE REPORT of the COMMISSIONERS appointed to inquire into the Constitution and Government of the BRITISH MUSEUM must be regarded as a document of the highest importance to those who desire to secure a right application of the large sums annually granted for the maintenance of this huge public collection. And although we, in common we believe with most men of science, are obliged to differ from the commissioners in some of the conclusions they draw from the evidence laid before them, yet we are bound to say that the evidence has been collected with industry, sifted with patience, and considered with an impartiality which, if it does not command an acquiescence in the commissioners' views, at least entitles them to respectful attention. The fault of the report lies in the commissioners having occasionally allowed their judgment to be biassed by the scientific reputation of some of the officers, whose peculiar views they consequently adopt without sufficient inquiry. They have scarcely considered that a great amount of technical knowledge may be combined with contracted judgment in matters of public policy. Nor have they always perceived that a principle of action which may be tolerable in private affairs becomes indefensible when applied to national interests.

About three years have elapsed since we ventured to suggest the expediency of removing to the Royal Botanic Garden, at Kew, the whole of the botanical department of the museum, together with a good selection of modern books upon natural history, and of connecting them with a reading-room, public lectures, &c. (May 22, 1847). The commissioners did not overlook this recommendation; on the contrary, their line of examination, in the case of some of the witnesses, was evidently taken with a view to eliciting opinions by which they might be guided. The commissioners do not, however, refer in their report to the proposal of transferring the botanical collections from Great Russell-street to Kew, whence we infer that they could not make their minds up as to that question; and they cannot take upon themselves to recommend the systematic adoption of the practice of giving public lectures, because they think that the main purpose of the museum is the "conservation and arrangement of a vast variety of material objects, from which men of science, literature, and art, may derive assistance to their researches." (p. 35.) The enlightened founder of the museum, Sir HANS SLOANE, could scarcely have anticipated such an interpretation of the desire, expressed in his will, that the natural history collections "should be rendered as *useful as possible*, as well towards satisfying the desire of the curious, as *for the improvement, knowledge, and information of* ALL PERSONS."

To us it appears that words like these will bear but one interpretation—namely, that the museum collections were to be made useful to all persons, in every way that increasing knowledge and intelligence might point out. The commissioners can hardly mean to say that public lectures do not aid, very materially, in making such collections conducive to "the improvement, knowledge, and information of all persons;" nor can they intend to limit the collections to "the satisfying the desire of the curious." Nevertheless the effect of their decision is to make the museum a mere spectacle for idlers to stare at. The commissioners admit that the practice of the "HUNTERIAN collection, and that of the Jardin des Plantes and other Continental institutions is in favour of the introduction of this practice," and yet they cannot recommend it. That is to say, they think that what works well in Paris and elsewhere is not to be adopted in London, and that a practice which is found of great public utility in Lincoln's-inn-fields would be of no utility in Great Russell-street. The commissioners dwell upon the inexpediency of allowing the collections to be placed "at the disposal of lecturers not attached to the museum;" and there we agree with them; the museum officers should themselves deliver the lectures. The commissioners think otherwise; they say that superintendence and management are alone sufficient "to engross the time and the abilities" of the officers of the museum. If this were so more aid should be given. But is it so? We submit that the following facts, disclosed by the witnesses, entirely negative the supposition.

The keeper of the Banksian collection states (qu. 8315) as follows: "The general or arranged Herbarium at present consists of about 30,000 species, *certainly not more*, possibly somewhat less. The unarranged, or geographically arranged collections, may *probably* furnish 5000 or 6000 additional species." We may therefore assume the herbarium, whose arrangement, "superintendence and management," are alone sufficient to engross the time and the abilities of the officers of the botanical department as containing 36,000 species. This department of the museum was formed in 1827, or 23 years ago, from the great herbarium left by Sir JOSEPH BANKS. We have no knowledge of the extent of that collection: but it will, we imagine, be admitted by the friends of that great man that it could scarcely have contained fewer than 30,000 species, enriched as it had been for a quarter of a century by the contributions of learned foreigners, by purchases, and by the botanical collectors employed by the British Government. We have, therefore, 6000 additional species arranged, &c., in 23 years. Now, it appears from Parliamentary papers, that during this period two officers have been employed, with the aid of one or more assistants, and that the number of working days is 152 in each year for the principal keeper, and 230 for the under-keeper; so that there are 382 days of attendance in each year between the two officers. This being so, it follows that each of these additional 6000 species has demanded very nearly a day and a half for its incorporation with the herbarium!! What the expense has been is not known to us, our file of Parliamentary papers being very incomplete; but we see that the annual cost of superintendence is now 575*l.*, and if, in order to make allowance for less assistance supplied the Botanical department in former years than it now receives, we average the annual charge at 500*l.*, it will follow that the whole cost has been 11,500*l.* in 23 years, or *nearly two pounds* per species. This must be admitted to be a startling result, when it is recollected that the value of such things is about 6*d.* per species, and that the number of species contained in the herbarium of the British Museum is very considerably less than in some private herbaria of this country, for which no aid in superintendence, arrangement, and management has been supplied beyond what could be derived from the leisure of their possessors.

What the present condition may be of the collection thus expensively superintended, arranged, and managed, we have no knowledge: but if it is at all like what a part of it was when consulted by us some years since, we can only say that 11,500*l.* has been paid by the nation to very little purpose.

At all events, in the face of such a statement as this, it is difficult to understand how the commissioners could have assigned want of leisure as a reason why public lectures should not be given by the museum officers. The public will be apt to assign a very different reason. For ourselves, we believe that the value to the country of the natural history department would be essentially increased if a series of lectures, adapted to the wants and wishes of the public, and separated from mere technicalities, which would be neither understood nor appreciated, were delivered at stated periods by men of such scientific rank as that possessed by some of the officers of the museum. The knowledge, the tact, the anecdotes, and the conversational skill of the present keeper of the Banksian collection should surely fit him for this important duty.

Lectures, however, would be more appreciated, and would be more conveniently delivered in a garden than in such a place as the British Museum, and we must therefore examine, but on a future occasion, into the reasons which have been offered to the commissioners against sanctioning the removal of the dried plants from Great Russell-street to Kew.

THE STANWICK NECTARINE is at length announced for sale. On Wednesday the 15th of May the first 24 plants which it has been possible to propagate

will be brought to the hammer by Mr. STEVENS (see Advertisement), and no further supply can reach the market until next winter: so that the purchasers of these plants will be one clear year in advance of the earliest possessors of any which may be offered for sale hereafter. We mention this for the purpose of correcting a misapprehension upon the subject; some persons having imagined that the present sale is to be speedily followed by another. Beyond the 24 which Mr. STEVENS is now directed to sell, no other young plants at present exist.

The original Nectarine tree is in the possession of his Grace the Duke of NORTHUMBERLAND, at whose seat, at Stanwick, it has borne fruit for several years, and from which it derives its name. The Duke received it from the late Mr. BARKER, of Suædia, in Syria, a gentleman whose attention had long been turned to the acquisition of the finest fruit trees of the East, in the hope that they might be valuable in his native country. It was his anxious desire that such as proved to be adapted to the climate of the United Kingdom might be immediately dispersed; and the sale now announced is in furtherance of Mr. BARKER'S benevolent design. In surrendering his property in it to the public, the Duke of NORTHUMBERLAND has resolved that the proceeds, after paying the expenses of propagation, &c., should be transferred to a fund in aid of the Benevolent Institution for the Relief of Infirm Gardeners: a plan in which Mr. BARKER heartily concurred, and which we trust that the well-wishers to this excellent charity will heartily support. The sale will take place on the anniversary of the Institution, and the purchasers will have the satisfaction of knowing that in this instance they may contribute materially to its funds, while at the same time they are consulting their personal interests.

In excellence the Stanwick Nectarine is as far beyond all other Nectarines as a Green-gage Plum is beyond all other Plums. Beyond this praise cannot reach. It may, nevertheless, be as well to repeat on the present occasion what we stated some time since, when the high quality of the Nectarine had first become perfectly ascertained:

"The Nectarine forming the subject of this notice is about the size of an Elruge, and like it in shape, except in being less heart-shaped at the base. Its skin is pale, like that of the white Nectarine, where shaded, with a violet tinge next the sun. The flesh is white, exceedingly tender, juicy, rich, and sugary, without the slightest trace of the flavour of prussic acid. The stone is middle-sized, ovate, with rather a prominent sharp edge, very rugged, and of a chocolate colour. The kernel is sweet, like a nut, possessing nothing of the Bitter Almond flavour. The fruit of the Peach and Nectarine, partaking so much as it does of the quality of the Bitter Almond, must have been very deleterious in its unimproved state; but the varieties now generally cultivated retain but little of the injurious properties ascribed to the species by ancient authors; and, when well ripened, they can be generally eaten with impunity, notwithstanding the slight prussic acid flavour which pervades even their luscious sugary juice; but some constitutions are liable to be affected by this trace. It was, indeed, considered unlikely that amelioration would be carried much further. For at least a century little improvement has been effected, and in every variety the kernels have proved intensely bitter. But at last this is overcome; in the specimen above described the deleterious quality considered inherent in the species has disappeared; and Mr. BARKER himself informed me that his fruits with sweet kernels may be eaten as a full meal, in quantities, at any time of the day, and repeatedly, with perfect safety."

"To this we have nothing to object except that it scarcely gives the Stanwick Nectarine so high a character as it deserves. In fact, at the time when the description was written, its full value was imperfectly understood, the fruit which reached London having been damaged in the carriage. We have lately, however, been favoured by his Grace the Duke of NORTHUMBERLAND with a liberal supply, which arrived in the most perfect condition, and we can now appeal to various persons near London, who had the opportunity of tasting it, as witnesses to its unrivalled excellence. 'The most delicious Nectarine I ever ate.' 'The flavour is very delicious, and it is altogether most exquisite; I do not wonder at your speaking in such high terms of it.' 'It is a superb fruit.' 'Most delicious.' Such is the language in which great judges of fruit, accustomed to the finest known varieties, have spoken of the specimens they received."

This evidence is conclusive as to the great importance of the Stanwick Nectarine to our country, and we confidently believe that the time is not distant when it will be found in every fruit-garden in the United Kingdom.

ON THE PRESENCE OF IODINE IN FRESH-WATER PLANTS.

BY M. AD. CHATIN.

BY verifying the circumstance pointed out by Müller (Lindley's "Vegetable Kingdom," page 363), viz., the presence of iodine in a species of Cress of unknown origin, M. Chatin has ascertained—That iodine exists in the common Water-cress, and that this fact is neither peculiar to this species nor common to all Crucifers; that iodine is entirely absent from, or that, at all events, it cannot be found in terrestrial, whilst it is always present in aquatic plants; that of the latter, those living in running contain more iodine than those living in stagnant water; that, if the stagnant water is large enough to be much disturbed by the wind, the quantity of iodine in the plants growing in the water is more nearly equal to that in plants found in running water; that the quantity of iodine found in plants is, as a general rule, independent of their nature, but dependent on their habitat—this is shown by Confervas, Potamogetons, Nymphæas, Ranunculuses, Cresses, which are all equally rich in iodine when in running water, and all equally poor when in stagnant pools; and that the iodine is not combined with the tissue of the plant, but exists as an alkaline iodide dissolved in the sap.

Among the plants, from the examination of which the above results were deduced, M. Chatin enumerates the yellow Alyssum (Alyssum saxatile), Cabbage (Brassica oleracea), Shepherd's-purse (Capsella Bursa-pastoris), Erysimum, Wallflower, Horse-radish (Cochlearia armoracia), Radish (Raphanus sativus), as being all terrestrial Crucifers containing no iodine. Water-cress (Nasturtium officinale), Nasturtium amphibium, Conferva crispata, Chara fœtida, Fontinalis antipyretica, Bullrushes (Typha angustifolia and minima), Scirpus lacustris, Reed (Arundo phragmites), Acorus calamus, Sagittaria, Potamogeton crispum and pectinatum, Beccabunga, Phellandrium aquaticum, Gratiola, Water Ranunculus, all are Crucifers and other plants containing more or less iodine.

Whence comes the iodine which is found in fresh-water plants? They certainly do not form it. It is impossible that it should be derived from the salt springs and mineral sources in which it has been detected by Angelini, Cantu, O. Henry, and others; for it is found not only in plants growing in large rivers, such as the Seine, the Marne, and the Isère, but also in those growing in every brook, pond, and marsh. It comes, M. Chatin concludes, from every part of the earth from which, associated with chlorides, it is dissolved out by the flowing of the water. This explains why plants in running streams contain the most iodine; for in them one portion of the water is no sooner deprived of this element than more water with a fresh supply arrives to be exhausted in its turn.

And how does the iodine get into the plants? Is it through their whole surface, which separates it from the water by a peculiar action, as oxygen is, according to M. Ad. Brongniart's ingenious theory, separated in the process of respiration? Or does the iodine enter along with the water, either by the surface or the roots of the plants, and then become concentrated in their tissues in consequence of the exhalation of the same water, thus destroying M. Dutrochet's theory that plants which live in water do not transpire?

This discovery of the existence of iodine in fresh water plants explains the anti-scrofulous, anti-tuberculous, and other similar properties of Phellandrium, Water-cresses, Brooklime, &c., and the reason of the preference given to those plants which grow in running streams, as well as of the common custom of prescribing the habitual use of aquatic plants for persons living in those countries in which goitre is endemic. The water in which the ashes of these plants have been washed may be used for the same purpose, unless it be found more advantageous to extract the iodine from them.

M. Chatin, in analysing the plants, carefully calcined them, washed the ashes with boiling water, and tested for iodine with starch, sulphuric acid, nitric acid, and nitrate of potash and sulphuric acid. The discolouring of the liquids and the volatilisation of the iodine by the application of heat were always used as checks. According to their richness in iodine the plants furnished an intense violet colour immediately, or the same colour after the lapse of a short time, or a violet purple colour immediately, or after a more or less long space of time.

In making these operations several precautions are necessary. A portion of the iodine will be lost if the plant to be calcined be not moistened with a solution of caustic potash, and when this is done the ashes become inconveniently fusible. Saline mixtures, especially if rich in carbonates, mark the reactions more or less, particularly that of chlorine. The iodine disappears with great rapidity in solutions which are either too hot or too concentrated, and it is not easily to be detected in solutions that are a little too weak, &c. *Comptes rendus.*

KALE OR BORECOLE.

ALSO called *Kail, Open Kale, Winter Greens, Chou Cavalier* (derived from *Chou caulier*, alluding to *caulis*, a stem), *Caulet, Choux verts, ou non pommés, Grüne* or *Braunkohl ohne Kopfe, Cavolo aperto.*

The varieties of these are endless; they differ in having stems dwarf, or tall; leaves more or less cut and curled; in colour green, purple; or variegated with purple, red, green, and yellow. The transformations of all these render any attempt to give minute descriptions quite useless; it will be sufficient to point out the general characters of varieties that may be usefully distinguished as such.

1. *Dwarf Green Curled*, aliàs Dwarf Curled Kale, Very Dwarf Green Curled, Dwarf Winter Curled, Scotch Kale, Green Scotch Kale, Dwarf Curlies, French Dwarf Curled, Canada Dwarf Curled, Labrador Kale, Green Borecole, Dwarf Green Borecole, Frisé vert à pied court, Frisé à pied court. By one or other of the above names this is certainly known to everyone. The Canada Dwarf Curled was found to represent exactly the finest Dwarf Curlies grown many years ago in some parts of Scotland, the plants being very dwarf and closely curled.

2. *Tall Green Curled*, aliàs Tall German Greens, Tall Scotch Kale, Tall Green Borecole, Tall Greens, German Tall Curled Greens, Green Winter Greens, Frisé Vert du Nord, Frisé Vert du Nord Grand, Chou frisé, Chou frangé du Nord, Chou frisé non pommé, Chou frisé d'Allemagne, Grosser Grünkohl, Krauser Grünkohl, Nordischer Grünkohl. Height usually from 2 to 3 feet; but 2 feet is the preferable growth. The plants are capable of enduring severe frost; and, like the preceding, it affords the best Greens from the time after the first frost has mellowed its flavour, until the middle of February.

3. *Purple Borecole*, aliàs Purple or Red Borecole, Tall Purple Kale, Purple Winter Greens, Brown Kale, Purple Kale, Curled Red Kale, Curled Brown Kale, Braunkohl of the Germans. This in its formation and habit differs little from the Tall Green Curled; but the colour is deep purple; as the leaves enlarge they have an inclination to become green, but the veins still retain the purple hue.

4. *Variegated Borecole*, aliàs Variegated Kale, Variegated Plumage Kale, Chou Plume, Frisé panaché, Aigrette, Chou frisé, Vert et rouge, Bunten Plumage Kohl, Federkohl. A sub-variety of the Purple Borecole, having the leaves beautifully variegated; sometimes green and yellowish white, green and purple, bright red, purple, and green. It is occasionally employed for garnishing; but it is very good cooked, after frost. It is not quite so hardy as the Purple Borecole.

Dwarf Purple Borecole or Frisé rouge à pied court; and the *Dwarf variegated*, are merely sub-varieties of the two preceding, distinguished by their dwarfer habit of growth.

5. *Buda Kale*, aliàs Prussian Kale, Prussian or Buda Kale, Buda Greens, Russian Kale, Hamburgh Kale, Anjou Kale, Manchester Kale, Asparagus Kale, Duke of York's Kale, Camberwell Kale; and so closely allied as not to be worth distinguishing from it, are the Jerusalem Kale, Delaware Greens, Delaware Kale, Ragged Jack, Jagged Kale, Dwarf Feathered Kale, Chou à feuilles laciniées, Chou à feuille de Chêne. The Buda Kale is not so tall as the Purple Borecole; very hardy; leaves purplish, somewhat glaucous, cut and fringed. It has been blanched, in some cases, like Seakale.

Woburn Perennial Kale.—This is a tall variety of the Purple Borecole, with foliage very finely divided or fringed. The plant lasts many years, and may be propagated by cuttings, as it neither flowers readily nor perfects well its seeds. Its produce at Woburn is stated to have been more than four times greater than that of either the Green or the Purple Borecoles on the same extent of ground. The weight of produce from ten square yards was 144 lbs. 10 ozs.; but some of the large kinds of Cabbages and Savoys will exceed this considerably, and prove of better quality. The Woburn Perennial Kale can, therefore, only be recommended where the climate is too severe for the more tender kinds of the Cabbage tribe.

Tree Cabbage, aliàs Great Cow-Cabbage, Cesarean Borecole, Chou en Arbre, Grand Chou à Vache, Chou Cavalier, Chou à Chèvre, Grand Chou Vert, Chou Vert de Touraine, Baumkohl, Grosser Kuhkohl.—This grows to the height of six feet; and in La Vendée and in Jersey it is reported that it attains the height of twelve feet or upwards. The leaves are large, smooth, or but slightly curled; its sprouts are said to be good when cooked, and cottagers might grow it with advantage in some cases, as it affords a supply for cattle. Its merits, however, have been greatly over-rated, for, when tried in this country against other Cabbages, its produce was nothing extraordinary.

The *Thousand-headed Cabbage*, aliàs Chou à mille têtes, Chou à Mille têtes du Poitou, Chou branchu du Poitou, is allied to the preceding, but does not grow so tall, and sends out numerous side-shoots. On the whole it is preferable to the Tree Cabbage.

Flanders Kale, or Caulet de Flandre, is a tall-growing kind, distinguished from the Tree Cabbage by its purplish foliage.

Cockscomb Kale, or Chou à feuilles prolifères, produces sprouts, along the ribs, on the surface of the leaves; but is of little value. *R. T.*

DISEASES OF PLANTS.

(*Continued from p.* 261.)

The three last genera of injuries being generally caused by the work of insects lead me to the following observations in the form of an appendix.

On the Diseases which have been individualised by the Name of one or more Insects, or which have been attributed to Insects.—Almost all writers on vegetable pathology have agreed in placing amongst diseases of plants the injuries caused by insects; following up on this occasion the ideas on entomology entertained in the times of Theophrastus and Pliny. Thus some, in describing the effects of worm-eating, seem disposed to revive the doctrine of spontaneous generation. I will not stop to refute this opinion, as it appears that Linnæus, Redi, Vallisneri, and others, have sufficiently demonstrated its falsity. I will only observe that all the chief maladies depending on insects may be classed under one or other of the three last preceding genera. I will also mention the principal facts and phenomena

which the greater number of those for whom I write may themselves witness, and which, I flatter myself, may prove to be of some utility.

The most careful observations of naturalists have shown that there perhaps is not a single species of plant that is not attacked by some insect or another. The motives for which they invade them are these: 1, to procure nourishment for themselves; 2, to place their offspring in safety; 3, to protect themselves from their enemies, and insure their own safety whilst performing some of the functions to which they are destined by nature. Plenck is the one of all others who has treated of these diseases with the greatest accuracy. He places among ulcers the ulcerations caused by insects, and the disleafing or stripping of leaves by the same, classing both diseases amongst wounds. In his class of fluxes he mentions the albugo of aphides, their honey dew; in that of cachexies he includes chlorosis from insects, blotches, phthiriasis, vermination, phthisicalness caused by the stripping of foliage by caterpillars; among excrescences he has Rose galls [bedeguar?], scaly productions, &c. To me it appears that the whole of these maladies are real wounds in their origin, which have in their consequences been so fatal to the plants. We shall see that neither these, nor several other diseases come on but by the effects of laceration such as that caused by coleoptera, by incisions, or intrusion, as for example that of the cynips tribe; or by puncture and suction of the juices, as is done by the gall insect. These insects may be considered as the most terrible enemies of plants.

I would refer to the genus *Strangulation*—

1. The *webs* of insects. It is not the spider only which with the threads of its web suffocates some plants. Many other insects, and especially those of the family of lepidoptera, either in passing to the state of chrysalis, or to defend them from their enemies, or simply in order to live, take possession of leaves, sometimes roll them up like a little horn, after having, to facilitate the operation, lacerated some part, sometimes stretching threads from leaf to leaf, knot them together to form a receptacle for their young brood, as may be observed on fruit trees, especially on the Pear, Apple, and Plum, and above all, here, in the Bolognese district, on the Cherry. These leaves being thus prevented from performing their ordinary functions, the worst consequences must follow, especially in young trees. Thus the curculio of the Cherry, the Pear, and the Vine, in some seasons, causes the desiccation of some branches, from the leaves having been curled up when young. This evil must be prevented by examining the branches in winter and clearing away all the masses of leaves of the preceding year remaining about the trees, which are all nests of insects, and burning them immediately.

To the genus of *Lacerations* belong—

2. *Disleafing* or *stripping of leaves*.—There is scarcely a plant whose leaves do not serve as food to some insect. Nearly all the larvæ of lepidoptera and coleoptera live upon them. Many beetles, such as the cockchafer, feed in the same way in their perfect state; the cockchafer is particularly fond of the Maple, at any rate with us. Thus sometimes we see the leaves of trees so eaten by insects that nothing remains but the fibres, whilst in other cases all the internal substance is eaten away and the epidermis alone remains. The Phalæna Bombyx graminis *L.* destroys meadows by eating the Grasses.

3. *Fall of buds*.—In the same manner the young buds of plants are attacked by insects such as the larvæ of lepidoptera, whilst those of coleoptera which live underground are as destructive to the roots. There is one larva which lives on the root of the Lucerne and kills it, another on the Rye, and a third on the Hop roots.

4. *Truncated plants*.—We not uncommonly may observe plants as it were truncated or broken off. If examined it will be observed that they contain a larva which has devoured the substance of the plant where it appears broken off. This once happened in a hemp field destroyed by a pyralis, described by me in a special memoir. One year again in a nursery of grafted trees, and in the espaliers, many young trees were broken off from the ravages of, I believe, the Cossus æsculi of Fabricius. Naturalists well know that the larvæ of certain insects are only to be found in the interior of plants.

5. *Chancres from insects*.—This name is given to a disease which causes so many trees to perish from being pierced, bored, and deprived of their internal substance, of which nothing remains but a sponge-like mass. This is clearly owing to insects, which produce the mischief in their larva state, remaining a long time within the trunk of the tree. Thus we know that the brown cockchafer and the stag-beetle destroy trees. The latter, which is the Lucanus cervus of Linnæus will sometimes kill the most vigorous Oaks, as the larva of the Phalæna cossus *L.* occasions the death of so many Willows, and the Sirex spectrum *L.* lives in Pines and Firs. Some will have it that these chancres are also caused by earthworms, but it does not appear that such animals feed on vegetables.

6. *Chlorosis from insects*.—Plenck having observed that some plants, such as Rye, lost the colour of their ears, which remained small and poor, called these plants chlorotic, attributing that state to insects, from having observed some nestled in them. To me it appears to be a case of the results of laceration.

VILLA AND SUBURBAN GARDENING.

Public taste as regards certain plants is exceedingly capricious. The favourite of to-day, so to speak, is supplanted by some fresh candidate for our esteem on the morrow, and however undeservedly, it almost vanishes from our gardens. This has been the fate of the once much prized Calceolaria, a circumstance which may in part be attributed to the difficulty amateurs have experienced in wintering it. I have frequently heard amateurs say that they had given up the culture of the Calceolaria, as their stock entirely disappeared during winter, and on the return of every spring a fresh supply was wanted. Almost all the best growers of the Calceolaria prefer young plants which have been struck in the autumn, and kept in a dormant state during winter. I have wintered Calceolarias without loss on a shelf over the pathway of a common greenhouse, or on one at the back of the house close to the glass. In such situations they very rarely damp off. I have kept hundreds of the choicer kinds this winter with scarcely a failure, but then great attention has been paid to them as regards the supply of water. Just enough should be given to keep them from flagging until they show signs of growth in spring, when they should be repotted at once into the pots in which they are destined to bloom. The plants may then be placed on the shelves of a well constructed and well ventilated greenhouse, or in a common frame; in the latter situation they must be carefully protected from frost, and plenty of air must be given them on all favourable occasions. The rapid progress they make under such circumstances is astonishing; one point which must never be neglected is to keep them free from the fly, an enemy which is easily subdued by fumigating the moment it appears. An eminent cultivator of these plants informed me that he never neglected fumigating them once every week from the time they commenced their spring growth until they began to open their flowers. The reason he assigned for this was, that it is difficult to discover the fly on its first appearance with the naked eye, and that prevention is better than cure. As to soil, I have found a fibrous loam, with one-fifth decomposed stable manure and half that quantity of silver sand, answers all purposes. This compost well mixed together, and the pots properly drained, will, with proper attention, insure good bloom. The production of new varieties from seed, and the mode of propagating the best kinds with certainty, will be treated of in a future article. *Pharo.*

TRADE MEMORANDA.

Will any one inform us who Mr. W. B. Doling, the Forest, Lyndhurst, Hants, is, who favours nurserymen with large orders for plants?

Home Correspondence.

Guano Beneficial to American Plants.—I have been in the habit of using guano and other strong manures in a liquid state for some years past, to the Rhododendron, Ghent and Indian Azaleas; and with great advantage. My practice is to use the guano in the proportion of 1 lb. to 30 gallons of manure-water, that runs from the stables and farm-yard. I water the Rhododendrons and Ghent Azaleas as soon in the spring as I perceive the blossom-buds beginning to swell, and continue it at the rate of 8 or 10 gallons to each plant until the flowers are expanded, varying the watering according to the weather; if the weather continues dry, water is given once a week, but if damp, only once a fortnight. I also vary the quantity given each time, according to the size of the plant, taking care that each plant gets enough. As soon as the blossoms begin to drop I again have the plants well drenched with guano-water, so as to encourage the early growth of wood; by this means the latter is made earlier, and is consequently better ripened, and the foliage is of a much deeper colour than if no stimulus had been given. I treat the Indian or Greenhouse Azaleas in the same way, with the exception of giving them a short rest for a fortnight or three weeks after flowering, when they receive but little water of any kind. I then bring them out, and give them such pruning as is necessary to keep them in a good pyramidal shape, after which they are supplied with strong guano water, until they have completed their growths; they are then placed out of doors in a sunny situation, where they remain with the pots protected from the action of sun and wind until the autumn rains set in, when they are housed for the winter. The advantage of manure or guano-water to the greenhouse Azalea is, that the blossoms are much finer, and the petals of better texture; and I find that by the use of manure-water the most deciduous kinds retain their foliage through the winter, and are well clothed with foliage when in blossom, which I consider adds much to the beauty of the plant; even the old, but now rare one, "Flore pleno," under this treatment is an evergreen, and although one of the most delicate of Azaleas, it will bear guano water as well as any of the more robust kinds. When it has not been convenient for me to have the manure-water previously prepared for the Azaleas, I have placed a piece of guano, about the size of a walnut, on the surface of the soil, and watered upon it from time to time, and I never found any bad effects from this practice. *Henry Bundy, Dynevor Castle.*

Ceanothus papillosus, C. dentatus, and C. rigidus have stood the winter here; the plants were kept rather dry. *W. Culverwell, Thorp Perrow, Yorkshire.*

The Crucifer about which "A. B." enquires is Nasturtium amphibium; after describing it in the "English Flora," Sir J. E. Smith, adds: "This plant is noticed by the celebrated M. Chateaubriand, in his account of England, for its wonderful powers of increase by root. He observed it in the river, near Beccles, where he long resided as an emigrant, and his rather florid description has excited wonder and curiosity in many, who daily, perhaps, pass over, without regard, several no less interesting works of their Creator." The fact is, the stem emits roots at each node, which strike into the mud, and after a time it ceases to be connected with the original root. The rest is poetical. *F. B., April* 30.

Bees.—Will "A Peebles Apiarian" describe the hive he uses, or at least the "doorways" and the "door," and state on what occasions he is in the habit of closing the door so that the bees have neither egress nor ingress from or to the hive; and for what period he at any one time keeps the door so shut, and the state he finds his bees in on re-opening it; as also similar information respecting the "air holes" he mentions. Will he also state what he considers to be the distance "within range of their short flight." His other remarks will be answered by a careful perusal of the articles at pages 165 and 216, excepting that I omitted to state my reason for not continuing the brine pans after May, which is, that I have found few or no bees resorting to them after that time, though I am yet uncertain whether the bees do not still entertain some desire for saline particles, as in consequence of the power of the sun the quick evaporation of the watery portion of the drainings of stables, &c., leaves the saline particles contained in the drainings more concentrated, and this mixture may be more agreeable to them, and thereby cause them to reject the plain brine. *Y.*

The Rotting of the Flowers of Brugmansia Knightii is not of common occurrence, at least as far as my observation goes, and I have seen it grown under widely different systems of treatment. Without presuming to offer an opinion as to the causes of the disease, I would recommend "Lancastria" to grow this plant in the open air during the summer months, for there it assumes a strong, robust, and vigorous habit of growth. Remove it from the greenhouse in May, and replace it in September, and it will flower abundantly, without being liable to disease; the finest plant I have seen was grown in this locality (Yorkshire) in this manner; it was covered with a profusion of its interesting flowers during the greater part of the summer; it was potted in rich turfy loam, having a small quantity of decayed vegetable matter incorporated with it; it requires a liberal supply of water. *W. R.*

Winter Treatment and Spring Covering of Wall Trees.—In early winter I have my wall trees unnailed, so that the old shreds may be removed, and the trees kept as far from the wall as possible, in order that the warm early spring weather may not excite the sap too early, which it is apt to do when the trees are nailed close to the sun-warmed wall. They are left in this condition (pruning in the meantime) until the blossom-buds indicate that it is time the trees were attended to. Under this treatment they are always considerably more backward than my neighbours'. This year, after the blossom on my neighbours' trees was cut off by the severe frost, my trees had not bloomed. As soon as they are nailed to the wall I have rough bagging, hung on tenter-hooks, before the trees every night; and, to keep the bags from blowing about and damaging the blossom, I place hop-poles against the wall below them, and tie the bags near the bottom of them. These bags are quickly removed or replaced by a stick with a nail at its point. I find that my Apricots, Peaches, and Nectarines have set a good crop, while my neighbours' blossom is as dead as the broom boughs that were intended to protect it. *H. H.*

Bleeding of Birch-tree Roots.—I have frequently observed the bleeding of Birch-tree roots that had been accidentally cut. I know no means by which it can be stopped, unless it can be done by a ligature, in the nature of a tourniquet. The long continued winter delayed the thinning of some of my plantations, and consequently a number of Birch and other trees have been cut at too late a season. The stools of the Birches have bled most profusely (I send you a specimen of one); so have those of the Sycamore, but the stool of the Sycamore bleeds profusely at whatever season the tree is cut. The stool of the Beech bleeds a little, of the Ash not at all, but perhaps it might do so if cut at a later season. The stool of the Oak bleeds at this season only, about the junction of the heart wood and sap wood. No bleeding can be detected from the boles of any of the trees above-mentioned. Both the stools and boles of the Scotch Fir and Larch exude resinous matter at whatever season the trees may be cut. I have remarked that where two Birches grew from one stool, and one stem was cut and the other left to grow, scarcely any, if any, bleeding took place from the cut stool. My forester says that the safest season for pruning or lopping a Sycamore, should occasion require it, is in the month of July; the tree bleeds less then than at any other time of the year. Have you remarked how much Birch seedlings affect the decaying stools of other trees as places of growth? Of course the seeds must find a lodging in them; but why should the Birch seeds find their way into these, while those of the Sycamore and the Ash, though springing up with and all around them, are seldom or never to be seen growing out of the roots of other trees? Since the above was written, I have had the roots of several Birch trees cut at different distances from the trunk; and I have in no case seen any bleeding, or discharge of sap from the roots. This leads me to think that the roots bleed only when cut at certain seasons of the year—perhaps about the time that the sap begins to ascend;

or, more likely, immediately before that. What seems to confirm this is that the stools of Birches, cut within these two or three days, bleed much less profusely than did those of trees that were cut several weeks ago. I have no recollection of the particular season of the year at which I had seen Birch roots bleeding. *Scotus, April* 27.——It is a question with me as to the sufficient tenacity of "Knight's Cement" to stop such copious bleeding as you refer to. Perhaps the following plan may succeed. Melt together equal parts of resin, beeswax, and tallow. Wipe dry the wound, and apply a piece of thick, black-hot iron for two or three minutes, and then lay on the above compo, which may be smoothed off by a warm iron. If the hydrostatic force exceeds the tenacity of this compo, it may be easily made harder by the simple increase of the proportional of rosin. Under ordinary circumstances, with small sections, I have found the smearing of the wound, when dry, with tallow, quite equal to the task. *W. E. Gill, Truro, May* 1.

Vine Pillars.—I have read the remarks at page 260, and I am led to suppose that urine had been used in too large a quantity. Urine is a great fertiliser of Grass, in proper quantity, but it is destructive to it when used in too great profusion, and it is, without doubt, the same with Vines. "The unhappy Vine" in question was, I have little doubt, made the victim of the improper use of this strong manure. I have proof continually before my eyes that Vines do grow, and that, too, in a most healthy condition, in Vine pillars. It is a curious fact that Vines will flourish under the circumstances in which they do in Vine pillars. The failure from mismanagement is no proof whatever against the discovery. The writer speaks of "lime rubbish," which is a very different thing from lumps of old mortar taken from an old building, and which must have been completely carbonised. I should wish to know if the Vine pillar, now taken down, had been protected from the winter's cold rain and melted snow, and if water had been given when wanted. I have had four large garden-pots of water poured into each of my pillars since I removed their roofs. I have a pipe in the middle of the top of each pillar in which to pour the water, so as not to wash down soil into the mixture below. *C. A. A. Lloyd, Whittington, Oswestry.*

Bleeding Roots of the Vine.—On the 17th of January, 1848, whilst renewing a walk in front of a Vine-border, for the purpose of enlarging the latter, several roots were unavoidably cut through, all of which bled freely. The alterations were completed as soon as possible, and the Vines, as heretofore, grew vigorously, and in the same season matured a heavy crop of fruit. I nevertheless deem it safer to perform such operations in the autumn. *Jos. Williamson, Castle Gardens, Whitehaven, April* 30.

Effects of the late Frost.—The low state of the temperature in my garden during five days in March is very remarkable, and worth placing on record.

March	25th,	lowest temperature,	16 degs.
,,	26th	,,	20 ,,
,,	27th	,,	2 ,,
,,	28th	,,	13 ,,
,,	29th	,,	21 ,,

On the morning of the 27th of March, every pane of every window in my house was covered with ice, even in rooms in which there had been fire the previous evening. All the blooms on the Gooseberry and Currant trees were quite destroyed, as were the *leaves* of the Raspberry, Bay trees in a very sheltered spot, Rose trees, and many shrubs too numerous to mention. Even Yew trees were partially injured. At 6 A.M. the thermometer had risen to 5°, and at 7 A.M. to 7½. At 9 A.M. it had risen to 31½, and, in the course of the day, to 47. I had three Vines in garden-pots, under glass, which had their leaves destroyed. We have had only three frosts in April; namely—

On the	23rd,	lowest temperature	28½ degs.
,,	24th	,,	27 ,,
,,	28th	,,	30 ,,

Two persons in this neighbourhood, who keep night thermometers on much higher ground than mine, did not observe the mark lower than 13° on the morning of the 27th. One of these thermometers was 400 feet above the level of mine.—*C. A. A. Lloyd, Whittington, Oswestry.*——On the night of the 25th March, the thermometer indicated 21° of frost, the mercury having fallen to 11°. On the night of the 26th it fell to 18°, and on the 27th to 25°, giving a decrease in the severity of the frost of 7° each night. It was accompanied by a sudden deep snow fall, which was followed by bright sunny days. Deodars, 8 to 10 feet high, have been stripped of their foliage; Cupressus torulosa, 8 to 12 feet high, entirely destroyed; Juniperus recurva, 4 feet high, killed; Ilex latifolia, blackened; Photinia serrulata, 10 to 12 feet high, killed to the ground; Euonymus japonicus, all sorts, destroyed; Araucaria Braziliensis, fine plants, 3 feet high, destroyed; Abies Morinda, killed by hundreds; Pinus insignis, much injured; Cedars of Lebanon, quite brown; Laurels, Laurustinus, Arbutus, Aucubas, Tree Pæonies, Bays, &c., also quite brown; Ribes of sorts, Lilacs, Syringas, Deutzias, Weigela, and other flowering shrubs, have been killed to the ground; standard and dwarf Roses, consisting of Noisette, Bourbon, Tea-scented, Hybrid Perpetual, and China, quite killed; whilst those of the other classes, together with dwarfs on their own roots, are very seriously injured. The fruit-buds on all my Pear trees are quite destroyed; not a blossom is to be seen. Maiden Peaches, Apricots, Nectarines, and Pears, are all injured—in fact, very few plants have escaped the severity of the weather on the nights of the 25th, 26th, and 27th. *Thomas Barnes, Danecroft Nurseries, Stowmarket.*

Pond Mud.—I am much obliged by the information which my inquiries respecting the cleaning out of ponds have drawn forth. The idea of hastening the work by digging into, or, if I may use the expression, herring-boning the body of the mud is quite new to me; and though I had considered the slack time between hay and Wheat harvests would be the best season, I am much struck by the arguments used in favour of the winter. Your Truro correspondent seems somewhat too precise in demanding a definition of the term pond, and I fear that any which might be given would be open to the charge of saying very plain things in very hard words. What I had in my own mind in writing was, that artificial water which forms so peculiar an ornament in an English landscape, and which one would hardly seek in the reservoir of Cornish iron-works. The mud must of course vary with the strata from which it is carried, with the swiftness of the stream, and the woodiness of its banks. Most fertile soils have been originally alluvial deposit, yet no one would think of carting them for manure, and I doubt whether, except in very rare cases, one could expect to find mud worth the expense; and if not, it would obviously be better to heap it up as an island, or a bank, to be planted with trees. There is nothing then to balance the cost of moving, and as I apprehend this would differ very much from the mere cost of moving so many cubic yards of earth in ordinary cases, any proved details would be very valuable. Was not the water at Blenheim cleared out a few years ago; that might be a good example? As regards the value of pond mud as manure, though animalculæ may be visible throughout, I cannot imagine that they will often be found so abundant as to lead one to forego the great advantages which might otherwise be derived from mixing it with lime; and the observations of Prof. Way upon the properties of alumina (*Gard. Chron.*, March 23d), serve to show that the clay of the mud itself has a considerable power of retaining ammonia, and an actual chemical value, independent of its effects in improving the texture of sandy soils. May it not also have arrested the alkaline salts of the water from which it is deposited in a degree far greater than we have hitherto suspected? Lastly, I would call your attention to two analyses of the mud of the Nile, detailed in the "Philosophical Magazine" for April, 1850, p. 325. They are very remarkable as containing no phosphates. I regret that the character of the spot from which the specimens were taken is not stated; and as the mud of the Nile has been accumulating for ages, we are left in doubt how the corn of Egypt does, under such conditions, obtain its phosphates. *Ruris Amator.* [The analyses are as follows:

Portion soluble in water.	Silica	0.05
	Water	4.75
	Organic matter	4.85
	Alkaline chlorides	0.65
Portion soluble in hydrochloric acid.	Peroxide of iron	11.30
	Alumina	21.65
	Carbonate of lime	3.85
	Carbonate of magnesia	2.05
Matters insoluble in water and acid.	Silica	46.55

Ants.—Can any one give me a successful recipe against ants; they are the pest of our house. Last summer they made their way from near a Fir tree, where we could discover no nest, in a long line to the house, along the wall of which they marched in long order, and on the other side of the house they set off at a like distance, and walked along the wall of the house until they were only separated by a flight of steps from their opposite brethren. This year they are confined to one side of the house, along which their name is legion, and although fed by tributary streams, and we have discovered two or three small nests, we make no impression upon them. From the outside they get into the kitchen by perceptible and imperceptible ways like harpies or the plagues of Egypt, tainting all they touch—spoiling jams and stores, and whatever they come near. I have tried numerous rags steeped in spirits of turpentine, lime, and boiling water, which, although they have a slight effect, at present are a mere flea-bite. Cannot "Ruricola" or some one help me? What will destroy them or send them to the "right about!" *Northwood.*

Bleeding of Late-Pruned Vines (see p. 248).—I have never known Vines to receive any injury from bleeding after being pruned, though I have cut them at all periods of their growth. In this I found the late Mr. Knight to agree, and I have conversed with many gardeners on the subject, all of whom dreaded it, but they could not assert that any real injury resulted from it. *T. Torbron, Lower Tottenham.*

Glazed Pots v. *Porous Pots.*—When Mr. Winkle, of Pickwickian celebrity, ascended the witness-box to give evidence in the renowned case of Bardell against Pickwick, it is well known to all readers of that most interesting case, that, with all the best intentions of strengthening the defence, he (Mr. Winkle) added very materially to the cause for the plaintiff; and in my opinion, "F.," in attempting to advocate the superiority of porous flower-pots, has materially strengthened the case of glazed ones. He proves nothing but by dogmatical evidence, which is no evidence at all. He has evidently taken cause for effect in reference to green slimy pots and saturated soil. His whole letter is one mass of questions, which I have neither time to answer, nor conscience to ask space for, even if I did so. I regret that "F." should be so waspish upon the point, because when a man argues in that spirit, he often gives utterance to what he does not really mean. If "F." can give direct proof that first-rate plants cannot be grown in pots of non-porous material, I shall be only too happy to become a convert to him, and retract all I have said in their favour. Has "F." ever observed in the window or greenhouse of the amateur good plants in glazed china pots? and will he give good evidence of the advantage of the escape of moisture from the soil in which a plant is growing other than by drainage from the bottom and evaporation from the surface? *G.* [We really thought that the absurdity of praising porous pots had long since been seen by everybody of average intelligence.]

Societies.

Horticultural, Anniversary, *May* 1.—Sir Charles Lemon, Bart., in the chair. The annual report of the Council and Auditors was read. It was resolved unanimously that this report be adopted. The ballot for Council and officers then took place, when R. S. Holford, J. Barchard, and J. M. Strachan, Esqs., were elected new members of Council, in the room of Sir P. de Malpas Grey Egerton, Bart., M.P., Sir C. Lemon, Bart., M.P., and R. W. Eyles, Esq. The Duke of Devonshire was elected President, J. R. Gowen, Esq., Treasurer, and Dr. Daniel, Secretary. S. F. Gray and C. Loddiges, Esqs., were appointed Auditors for the ensuing year.

Meeting at Worton Cottage, *May* 1.—The long prevalence of cold easterly winds has, no doubt, retarded the opening of seedling flowers. This day but very few were present. Mr. Story (not Strong, as reported last week) sent some more seedling Ericas; one of them, 10-50, raised from Jubana "set" with McNabiana, is a very beautiful thing. The circular whorl consisted of 11 flowers of large size, tube of a deep flesh colour, fine lip, white, delicately tinged with the same shade; 11-50 is also a striking seedling, dark red straightish tube, with a distinct dark band round that part where it expands into the lip, which is white, giving a pleasing relief to the flower; 12-50, a delicate light-coloured seedling, with a longer tube, decreasing in size till it expands into a wide star-like lip; 13-50, very similar in character to 11-50, but inferior in many respects, though rather brighter in colour. Mr. Shepherd, gr. to — Mitchell, Esq., Priory, Kew, placed two seedling Cinerarias, one a striking bronzy purple, but both too small at present for general cultivation. Mr. Stedman, nurseryman, Isleworth, brought a plant of a fine large flowering Mimulus; its foliage was strongly Musk-scented, colour yellow ground, with broad band of crimson maroon encircling the flower. Some seedling Pansies and a few Cinerarias were present, but nothing requiring further notice; the same may be said of a few seedling Pelargoniums which were not sufficiently found in bloom.

Royal Horticultural Improvement of Ireland, *April* 18.—The following were the awards of the judges. Six Stove Plants: Amateurs—1st, Mr. Bruce, gr. to Justice Crampton, for Euphorbia splendens, Begonia coccinea, B. speciosa, Amaryllis speciosa, Æschynanthus ramosissimus, Justicia carnea. Six Greenhouse Plants: 1st, Mr. Pressly, gr. to G. Burns, Esq., for Azalea Smithii coccinea, Epacris Willmoreana, Tropæolum Jarratii, Eriostemon cuspidatum; 2d, Mr. John Bruce. Six Cape Heaths: 1st, Mr. Pressly, for Willmoreana, persoluta rubra, propendens, sulphurea, Beaumontiana, Parmentieri rosea. Eight Ornamental Plants: 1st, Mr. Pressly, for Azalea indica alba, Acacia prostrata, Polygala acuminata, Kennedya ovata. Six Azaleas: 1st, Mr. Bruce, for macrantha rubra, spectabilis, indica alba, phœnicea, rubra plena, Smithii. Six Pelargoniums: 1st, Mr. Corrigan, gr. to J. D. Meldon, Esq., for Hebe, Duke of Cornwall, Coronation, Joan of Arc, Masterpiece, Victory. Specimen Stove Plant: 1st, Mr. Pressly, for Franciscea latifolia. Specimen Greenhouse Plant: 1st, Mr. Kelly, for Rhododendron Youngii (10 feet high). Specimen Citrus: 1st, Mr. Pressly, for a magnificent Orange tree, 10 feet high. Specimen Camellia: 1st, Mr. Armstrong, for C. Corallina (fine). Specimen Cape Heath: 1st, Mr. Bruce, for Linnæoides superba. Herbaceous Plants: 1st, Mr. Corrigan, for Anemone pulchella, Primula cortusoides. Six Greenhouse Plants: Nurserymen—1st, Mr. Livingston, for Chorozema nanum, Hovea Celsi, Correæa speciosa major, Eutaxia myrtifolia. Eight Ornamental Plants: 1st, Mr. Hodgins, for Azalea triumphans, indica alba, Epacris grandiflora, Cyclamen persicum odoratum, Diosma capitata, Erica ventricosa coccinea. Specimen Orchid: 1st, Mr. Hodgins, for Calanthe veratrifolia. Specimen Greenhouse Plant: 1st, Mr. Hodgins, for Azalea variegata. Specimen Cape Heath: 1st, Mr. Hodgins, for aristata major. Specimen Cactus: 1st, Mr. Livingston, for C. speciosissimus. Six

Cinerarias: 1st, Mr. Hodgins, for Adela Villiers, Cerito, Delight, Amazon, Countess of Zetland, Regulator. Auriculas (Green-edged): Amateurs—1st, Mr. Corrigan, for Standard of England, Stretch's Alexander; Self-edged, 1st, Mr. Edward Corrigan, for Hannibal and Squire Mundi. Polyanthuses (four varieties): 1st, Mr. Corrigan, for Black Prince, Buck's George IV., Beauty of England, and Pearson's Alexander. Hyacinths: Double blue—1st, Mr. Brady, gr. to the Earl of Charlemont, for Blocksberg, Laurence Koster, and Bride of Lammermoor; double red—1st, Mr. Brady, for Compte de la Costa, Honeur de Amsterdam, and Lord Wellington; double white—1st, Mr. Brady, for Prince Van Waterloo, Staut's General, and Heroine; double yellow—1st, Mr. Brady, for Heroine, Gloria Florum, La Grandeur; single blue—1st, Mr. Brady, for Prince Albert, Prince Van Saxe Weimar, and Charles Dickens; single red—1st, Mr. Brady, for La Francq de Berkeley, Sappho, and Monsieur de Feasch; single white—1st, Mr. Brady, for Grand Vanqueur, Voltaire, and Victoria Regina. Auriculas (Green-edged): Nurserymen—1st, Mr. Livingston, for Lovely Ann and Imperator; grey-edged—1st, Mr. Livingston, for Kenyon's Ringleader and Mary Ann; white-edged—1st, Mr. Livingston, for Favourite and Reform; self-edged—1st, Mr. Livingston, for Apollo and Lady Miltown; four alpines—1st, Mr. Livingstone, for Napoleon of the Alps, Sarah of the Alps, John of the Alps, and the Alpine Shepherdess. Various plants were sent in not for competition, and several other prizes were awarded; but we have not been favoured with the names of the subjects for which they were given.

Garden Memoranda.

The Fulham Market-Gardens.—After so long and severe a winter as that from which we are but just escaping, it may be satisfactory to know that no ill effects, beyond a temporary check, have been experienced from the frosts in these gardens, and what is true of these may be considered to be true of all the market-gardens round London. The extensive grounds occupied by excellent vegetables, which are everywhere observable, afford ample assurance that no scarcity of such food need be apprehended. The fruit trees are in full blossom, and there is every appearance that there will be plenty of fruit, so that altogether the future prospect is so far consolatory, except to the market gardener, who complains that "the market is already 'glutted;' that he cannot get rid of his produce, except at greatly reduced prices; and that if things do not mend he will have to employ horse instead of hand labour, the effect of which will be an inferior system of tillage." Let us hope, however, for better things, and in the meantime we will venture to give a few details respecting the present state of the crops.

Cabbages (*the Battersea or Fulham*) form the great bulk of the vegetables at present in these fields. They are planted at first thickly, and are thinned out in autumn for Coleworts, leaving the permanent crop in rows 2 feet apart, and the plants 20 inches asunder in the rows. The Battersea is a fine looking Cabbage, of the Vanack breed, and suits the market and the light ground which prevails in this quarter better than any other sort.

Cauliflowers have wintered safely under hand-glasses, the number of which to be seen in use in these fields strikes the "countryman," who may happen to see them, on his "first visit to town," with amazement; each of them covers three plants placed in the form of a triangle; and when the glasses are not wanted for this purpose they are employed in forwarding ridge Cucumbers, &c.

Broccoli.—Two kinds only are planted—the Early Cape, for autumn, and the Sprouting, for spring use. Large plantations of the latter may now be seen, here and there, ready for market. The fine large white Broccoli which is the admiration of everybody in Covent-garden market, is chiefly supplied from Cornwall, and from the strong loamy soils of Enfield, which suit it better than the light, black, highly manured land about Fulham.

Lettuces (*White Cos*).—These and Cabbages form such large proportions, compared with other crops, that a cursory examination of the fields just now would almost lead one to suppose that these two kinds of esculents formed the staple of the London vegetable markets; but it need hardly be stated that this is the worst of all seasons for viewing crops, most of them being in the ground, but not yet vegetated. The soil between the rows is now being stirred with swan-necked draw-hoes, not to kill weeds, for weeds there are none, but to promote the growth of the plants, which are now about one-third their natural size. They were transplanted from frames in February, and generally look well, though some show the ill effects of the cold dry north-easterly winds, which we have so long experienced this spring.

Spinach (*the prickly*) in most situations is a good crop; but in a few places it has failed, probably from rotting off early in autumn, a circumstance which has within these few years been more than usually prevalent.

Rhubarb is plentiful and finely coloured. The colouring is improved by placing dry straw round the plants, so as to partially blanch them.

Radishes are now being drawn out of 5 feet beds, some in the open ground, others on sloping borders at the foot of hedges where they had been covered with straw at night, so as to retain in the soil the heat it had absorbed during the day whilst exposed to the influence of the sun's rays. In this way they are obtained much earlier than they otherwise would be.

Turnips (*Dutch*).—Large breadths are just coming through the ground.

Carrots (*Early Horn*) in open beds look brown from the cold drying winds; but between hooped Potato beds, where they have received some shelter, they are green and healthy.

Potatoes in frames are now being dug for market, and are as yet free from disease. Others planted in 5 feet beds, hooped and matted at night, are about 6 inches in height, and will come into market after the early crops are out, and before those from the open ground come in. Some of the latter are appearing above the ground.

Kidney Beans.—Some of these have been planted, but it is to be feared that the ground is yet too cold for them. The second sowing often comes into use before the first, which will probably be generally the case with early plantations in the present season.

As we have stated, most kinds of fruit trees are in full blossom, and are as yet safe from frost. Apricots on walls have set their fruit well, and are being thinned out for tarts and bottling. Bush fruit promises abundant crops.

Miscellaneous.

Oncidium serratum.—A very striking, orchidaceous, half-twining epiphyte from Peru. Flowers, large, brownish-olive, and brilliant yellow, produced with M. Pescatore, of Paris. Till we received a flower of this curious species from M. Pescatore, it was only known to us from a rude copy of an old Spanish drawing, sent from Peru by the late Mr. Matthews, and preserved in Sir Wm. Hooker's Herbarium. The plant has oblong, smooth, terete, pseudo-bulbs, each having two broad sword-shaped leaves at the point, and several others below the pseudo-bulbs. The flower-stem was 9 feet long, partly twining, with five or six lateral branches, each carrying from four to six flowers near

the extremity. These flowers have the very singular form shown in the annexed figure, which is about twice as large as they are represented in the Spanish drawing above alluded to, and perhaps four times as large as they were with M. Pescatore. The colour is said to be cinnamon-brown in Peru, with bright yellow tips to the upper divisions. In the fresh flower they had the colour of Oncidium luridum, only brighter; but the yellow on the upper half of the delicately fringed and crisped petals was clear and brilliant. If flowered in the summer, the species would no doubt be much finer; as it is, we must regard it as one of the most remarkable of the short-lipped Oncids. *Paxton's Flower Garden.*

Abies Webbiana.—It may be interesting to know that a thriving specimen of this handsome Conifer, at Ealing Park, has very nearly 20 cones on its top branches. It has stood the winter uninjured, with a slight protection over the leading shoot.

Observations on the Adjustment of the Animal and Vegetable Kingdoms, by which the Vital Functions of both are permanently maintained.—This communication will consist of a detail of an experimental investigation which has been carried on for nearly the last 12 months, and which appears to illustrate in a marked degree that beautiful and wonderful provision which we see everywhere displayed throughout the animal and vegetable kingdoms, whereby their continued existence and stability are so admirably sustained, and by which they are made mutually to subserve each for the other's nutriment, and even for its indispensable wants and vital existence. The experiment has reference to the healthy life of fish preserved in a limited and confined portion of water. It was commenced in May, 1849, and the subjects chosen were two small gold fish. These were placed in a large glass receiver of about 12 gallons capacity, having a cover of thin muslin, stretched over a stout copper wire bent into a circle, placed over its mouth, so as to exclude as much as possible the sooty dust of the London atmosphere, without, at the same time, impeding the free passage of the atmospheric air. This receiver was about half filled with ordinary spring water, and supplied at the bottom with sand and mud, together with loose stones of larger size of limestone tufa, from the neighbourhood of Matlock, and sandstone; these were arranged so that the fish could get below them, if they wished so to do. At the same time that the fish were placed in this miniature pond—if I may so term it—a small plant of the Vallisneria spiralis was introduced, its roots being inserted in the mud and sand, and covered by one of the loose stones, so as to retain the plant in its position. The Vallisneria spiralis is one of those delicate aquatic plants generally selected by the microscopist for the exhibition of the circulation of the sap in plants; it throws out an abundance of long wiry strap-like leaves, of about ¼ inch in breadth, and from 1 foot to 3 feet in length: these leaves, when the sun shines on them, evolve a continued stream of oxygen gas, which rises in a current of minute bubbles, particularly from any part of the leaf which may have received an injury. The materials being thus arranged, all appeared to go on well for a short time, until circumstances occurred which indicated that another and very material agent was required to perfect the adjustment, and which, from my not having thought of it at the time of commencing the experiment, had not been provided against. The circumstances I allude to arose from the internal decay of the leaves of the Vallisneria, which became yellow from having lost their vitality, and began to decompose; this, by accumulation, rendered the water turbid, and caused a growth of mucus, or green slimy matter, on the surface of the water and on the sides of the receiver. If this had been allowed to increase, I conceive that the healthy life of the fish must have suffered, and probably their vital functions have been destroyed. The removal of these decaying leaves from the water, therefore, became a point of paramount importance to the success of the experiment. To effect this, I had recourse to a very useful little scavenger, whose beneficial functions have been too much overlooked in the economy of animal life—I mean the water-snail, whose natural food is the very green slimy growth, or mucus, and decaying vegetable matter, which threatened to destroy the object which was wished to be obtained. Five or six of these creatures—the Limnæa stagnalis—were consequently introduced, and, by their continued and rapid locomotion and extraordinary voracity, soon removed the cause of interference, and restored the whole to a healthy state; thus perfecting the balance between the animal and vegetable inhabitants, and enabling both to perform their vital functions with health and energy. So luxuriant was the growth of the Vallisneria under these circumstances, that, by the autumn, the one solitary plant that had been originally introduced had thrown out myriads of offshoots and suckers, thus multiplying to the extent of upwards of 35 strong plants; and these threw up their long spiral flowering stems in all directions, so that at one time more than 40 blossoms were counted lying on the surface of the water. The fish have been lively, bright in colour, and appear very healthy; and the snails also—judging from the enormous quantity of gelatinous masses of eggs which they have deposited on all parts of the receiver, as well as on the fragments of stone—appear to thrive wonderfully, and, besides their functions in sustaining the perfect adjustment of the series, afford a large quantity of food to the fish in the form of the young snails, which are devoured as soon as they exhibit signs of vitality and locomotion, and before their shell has become hardened. Thus we have that admirable balance sustained between the animal and vegetable kingdoms, and that in a liquid element. The fish in its respiration consumes the oxygen held in solution by the water as atmospheric air, furnishes carbonic acid, feeds on the insects and young snails, and excretes material well adapted as a rich food to the plant, and well fitted for its luxuriant growth. The plant, by its respiration, consumes the carbonic acid produced by the fish, appropriating the carbon to the construction of its tissues and fibre, and liberates the oxygen in its gaseous state to sustain the healthy functions of the animal life, at the same time that it feeds on the rejected matter, which has fulfilled its purposes in the nourishment of the fish and snail, and preserves the water constantly in a clear and healthy condition. While the slimy snail, finding its proper nutriment in the decomposing vegetable matter and minute confervoid growth, prevents their accumulation by removing them from the field, and, by its vital powers, converts what would act otherwise as a poison into a rich and fruitful nutriment, again to constitute a pabulum for the vegetable growth, while it also acts the important part of a purveyor to its finny neighbours. *Robert Warrington, F.C.S., in Beck's Florist and Garden Miscellany for May.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Proceed with potting all stove or greenhouse plants which require it, in order that they may have the advantage of the next two months in which to produce a

vigorous growth, and have plenty of time for maturing it before winter. Many of the free-growing plants, which were potted early in the season, will now require larger pots, with which they should be immediately supplied, unless it is wished to flower them in their present sizes, and somewhat earlier than their usual season. In the latter case, occasional waterings of liquid manure, of moderate strength, will be useful, both to maintain the present vigour of the plants and to assist the future development of their flowers. Keep a moist growing atmosphere in the conservatory, by frequently sprinkling the paths, curbs, and other evaporating surfaces, in warm weather; and when syringing, sprinkle well the walls of the house, that they may give off in combination with moisture the heat which they have absorbed during the day. In fine weather, a little before the sun goes off the Pelargonium-house, close it for an hour, and syringe the plants; after which, air may again be given according to the state of the external atmosphere. In the Orchid-house the moisture should be moderate, unless when the weather is so fine that it may be accompanied with light and heat. In watering and syringing, care must be taken to prevent the moisture lodging in the young growths, as they are liable to damp off in their early stage. Constant attention will be necessary to keep the plants clean and free from insects, of which all the troublesome kinds breed most rapidly at this season. Encourage specimen plants of the choicer kinds of Fuchsias, Erythrinas, Oleanders, Brugmansias, Hibiscus rosa-sinensis, &c., for placing in the conservatory along with Balsams, Cockscombs, Amaranthus, and other tender annuals usually grown for summer and autumn decoration; all of which should be shifted on progressively, using rich loamy soil.

FORCING DEPARTMENT.

PINERIES.—During very strong bright sunshine, pay attention to the shading of all Pines, unless this is rendered unnecessary by Vines growing over them. Maintain a moist atmosphere, with a high temperature; a free circulation of air during the day, and a more moderate one during the night also. Where they are grown in pots, the plants should be frequently examined, and repotted as they require it; that by shifting a few at different times, the fruit may come up and ripen in succession. Let us impress upon our younger readers the necessity of allowing plenty of room to Pines in all stages, that their leaves may take their natural curved shape, instead of compelling one another to stand erect. One of the most important points is to give plenty of air; and if these items be attended to, the plants will acquire a sturdy habit, and with due care in other respects, the result will be large fine flavoured fruits upon small plants. VINERIES.—If the outside borders have been kept covered with warm litter, according to previous recommendations, they will not require water, unless in very dry situations. They should, however, be occasionally examined and watered with liquid manure or guano water, in the proportion of half an ounce to a gallon of water, if the state of the soil requires it. Give air early in the morning, commencing with a little, and increasing it gradually till mid-day. The crops for the supply of the family during the late autumn and winter months will now require regulating as regards bunches. MELONS.—Those who are anxious to produce Melons in the greatest perfection should plant about the beginning of May, as they thereby secure the four finest months in the year for growing and maturing them; and as they are also the months in which insects increase with the greatest rapidity, no pains should be spared to keep them in check. To this end all damaged leaves should be removed, as insects generally effect a lodgment most easily on those parts of the plants which have received some check in their healthy development.

FLOWER GARDEN AND SHRUBBERIES.

Premising that the operation of planting out may now commence in favourable localities, but as we do not yet consider it safe, except in such situations, we would not recommend too great precipitation in the matter, unless it be an object of the first importance to make a very early display; and even in such a case abundant means of protection should be at command. The precariousness of our English climate renders such precautions indispensable. In our own case it is necessary, for the reason above mentioned, to plant very early; but to protect the plants in case of a sudden change in the weather, as well as to protect them from the rays of the sun, it is our practice to use branches of evergreens, the lower ends of which are sharpened and fixed in a leaning position over and amongst the plants. The Yew branches taken from the wall trees that no longer require covering also come in useful for this purpose. This is a simple method of preventing, at a small cost, a loss which would be irretrievable. We of course commence with the hardiest kinds, as Pentstemons, Antirrhinums, &c, and follow with Calceolarias and Verbenas, selecting the best established of those plants, which have been gradually exposed to the open air. Except in very extensive places, very little advantage is gained by commencing too soon, and the meantime may be more usefully employed by performing all preliminary operations and getting the work forward elsewhere, that a strong force and undivided attention may be devoted to this work as soon as it may be prudently commenced. It will be advisable to cast an eye over the arrangement, and compare the quantity required with the total in stock, that any deficiency may be provided for by apportioning a smaller number to the different beds, or by substituting something else of which there is a greater abundance. Consideration should at the same time be given to making a provision for filling up the gaps, which are liable to occur under the most careful management. Let Neapolitan and Tree Violets be immediately parted, and planted in a frame of rich leafy soil on a shady border. Carnations, Picotees, Cloves, &c., should be immediately staked; they are charming things for the flower garden, and invaluable for supplying cut flowers for vases or bouquets.

FLORISTS' FLOWERS.

RANUNCULUSES.—Seedlings will now require particular attention, and every means adopted to ensure a luxuriant growth, for according as the foliage is stout and vigorous, so will the roots be, and if they take up well, a good bloom may be expected from them the succeeding season. Those on beds should be kept perfectly clean, removing the weeds at an early period, before their roots get entangled amongst those of the Ranunculuses.

KITCHEN GARDEN.

All the shoots first produced on the Asparagus beds should be cut, both small and large, leaving none to shoot up into leaf, till the time comes when cutting is discontinued for the season, which will be about the 10th to the 15th of June. We have practised this mode for many seasons, and we find our beds improving yearly. If any are left sooner, even though very weak ones, they are developed at the expense of the shoots which are still to be thrown up; and the latter come smaller and less abundantly than they otherwise would. Where a portion of the Asparagus beds is yearly required for forcing, cutting should be discontinued, with a quantity sufficient to meet this demand, at least a fortnight earlier than from the general beds. Seakale pots, and the materials with which they have been surrounded, should now be cleared away, the remaining etiolated foliage cut off, and the ground sprinkled with common salt and forked over, taking care not to injure the crowns.

HARDY FRUIT GARDEN.

Apricot walls must be frequently examined, and the caterpillars destroyed; and where the fruit has set very thickly, a portion of those where they are most crowded should be removed at once, taking care, however, to leave twice as many as would constitute a fair crop, as they cannot be considered safe till the stoning is over. Disbudding of Peaches and Nectarines should also be proceeded with; and both these and the Apricots should be washed with the engine at least once a week. The remains of the evergreen branches may be removed where the fruit is set, as their presence is no longer useful, but rather injurious, from being so closely in contact with the leaves. We find the plan of fixing canvass upon rollers to answer admirably as a protection for fruit trees on walls. Although the first expense is rather costly, I have no doubt it will be cheap in the end. Where the walls are furnished with projecting coping or weather-boards, the soil at the foot of the walls is liable to become very dry; if upon examination it is found to be so, it should be well watered, and at the same time the soil should be loosened and a little soot dusted amongst it, as such a situation affords an excellent harbour for insects in various stages. The water used to moisten the soil will assist in destroying these pests, if it have soot dissolved in it. After the natural gross luxuriance of Pear trees has been overcome, they generally mature more blossom buds than they can set; and still more fruit is set than can be properly supported. In the first struggle for existence, it sometimes happens that more embryos fall off than can be conveniently spared; and to prevent this, the blossoms of choice varieties should be thinned. Advantage may be taken of this, to balance the rates of their growth, calculating the strength of each, and leaving sufficient to prevent grossness, but removing enough to prevent any stunting or mutual impoverishment being caused by a superabundance of flower buds.

State of the Weather near London, for the week ending May 2, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

BACK NUMBERS: One shilling will be given for No. 35, 1847.

BOOKS: *J Messenger*. Lindley's "Vegetable Kingdom" may be had of all booksellers. For price and other particulars, see an advertisement in another column.‡

GRAPES: *C B*. Your Grapes may be mildewed; but the three berries you have sent us are affected by rust. Sulphur will kill mildew if it is applied the moment the fungus appears.‡

HEATING: *J S L*. We are not sure that we understand your plan; if we do, there is no objection to it. The essentials in Polmaise heating are to throw the heated air at once into the house, to have heating-surface enough, and to take care that the openings through which the hot air enters the house are large enough. They can hardly be too large.

INSECTS: *J F*. The beetles which have eaten the young leaves of your Vines are Elater (Athous) vittatus, the larvæ of which are *wireworms*; as many as possible should therefore be destroyed at once, either by hand picking or shaking the plants. *W.—Este*. Thanks for the specimen of the bark of the Downton Pippin with its inclosed insect, which we fear is damaged. Will you seek for more specimens, and confine them in a box till they become winged, and then favour us with one of the moths. *W.—Canfordiensis*. The larvæ which have eaten off the Barley are the real wireworm, or larvæ of Elater segetis. *Gard. Chron.* (1845, p. 344), 1, the plant attacked by—2, the wireworm of the natural size; 3, the same magnified; 4, the perfect beetle; 5, the same magnified.

The plan of laying down patches of damp Grass, or burying them in open wicker baskets in different part of the fields, inspecting them every other morning, is one of the most effectual methods for destroying these insects. *W.—Agricola*. The insects sent are the real culprits, being the true wireworms. See the answer to "Canfordiensis." *W.—E H*. The beetles which have attacked the young Vine shoots by night are the two species of Vine weevils, Otiorhynchus sulcatus and picipes. Continue your search by night, laying down a white cloth beneath the plants, which must be smartly and suddenly shaken about midnight; the insects will fall to the ground, and must then be destroyed. *W.—C L*. The beetles which have attacked your Plum trees (you do not say in what manner) are the red-legged weevil (Otiorhynchus tenebricosus). They may be destroyed in the manner described in the preceding answer to "E. H." *W.—A R*. The publication "Insecta Britannica," will be commenced as soon as a sufficient number of subscribers' names are obtained. The subscription is to extend to five volumes, *i. e.*, a volume per annum, at the price of 18*s*. Each volume will comprise a separate tribe, and will be illustrated with plates of generic details. You will find a prospectus addressed to your initials at our office. *W.—G B*. We suppose the buds and bark of your Rose trees must have been attacked by the weevil Otiorhynchus tenebricosus, which hides itself during the day, and must be sought for at night. *W.—W A, Newport*. The grubs which have destroyed your Oats and Vetches are the young state of the common daddy-long-legs. Turn up the soil, and send a number of ducks into the field, and when the flies appear, employ children to destroy them. *W*.

KIDNEY BEANS: *A B*. There can be little advantage or economy in "sowing Kidney Beans very thickly on any spare piece of ground, and afterwards transplanting them to their proper place." The plan may be practised by market-gardeners, but we have not seen it adopted near London.‡

NAMES OF PLANTS: We have to ask for the patience of two or three correspondents under this head until we can find leisure to examine what they have sent. They will all be answered next week.—*C T*. Nemophila discoidalis.

NEW HOLLAND SEEDS: *A Clergyman*. These are not from Australia, but from tropical India. They are all stove plants, and none of them much worth growing. Canna indica, the common Indian Shot, will flower out of doors if raised and treated like a tender annual.

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d*., or 5*s*. for 25 copies for distribution amongst cottage tenantry.

PLANTS DAMAGED IN TRAVELLING BY RAILWAY: *J F* complains of the gross negligence of those through whose hands parcels are conveyed from London. He states that he received, from a well-known nursery in London, advice of a basket of plants (according to order), which was sent to the railway station on the Friday, but did not come to hand till the Monday. Its contents were packed (he is confident) most carefully, and, with fair treatment, would have travelled any distance; but, out of 21 pots, seven were broken to shivers and the plants damaged, and two other pots arrived quite empty. He adds, "You can easily imagine in what state Calceolarias would arrive under these circumstances." We insert his complaint at his request; but we very much doubt the good packing he speaks of.

THE TRANSMUTATION OF SPECIES: *F L S*. This is a speculation and not an ascertained fact. We have never been able to obtain satisfactory evidence that it happens; on the other hand it is impossible to prove a negative. As to mere opinions they are of little value either one way or the other. We do not recognise the seeds from Cusco, but we will examine them at leisure, and, if we can identify them, report further.

VINE BORDERS: *J S H*. It would be desirable not to have the border less than 10 feet wide; but under limited circumstances, as regards space, you may succeed in having good crops for some years with a border 5 feet wide. Perhaps you will have the kindness to state the aspect of the wall for which you require to know the most suitable trees.‖

MISC: *S A*. Annuals sown round standard Roses, for the summer months, will not damage the Roses, provided they grow close to their stems.‡

SEEDLING FLOWERS.

CALCEOLARIAS: *Amicus*. Very pretty; but not equal to kinds of the same colours already in cultivation.*

CINERARIAS: *J M*. Quite withered up when received, but apparently worthless.*—*A R*. 1, white tipped with purplish lilac, dark disc; a good flower. 2, violet purple, with a circle of white surrounding a dark centre; beautiful in colour, but too starry. 3, light blue, with a white circle surrounding a dark blue disc; irregular, and otherwise inferior to kinds already in cultivation. 4, purplish lilac with a dark centre. Of the four sorts sent 1 is the best.*—*N W*. Nicely packed, and arrived in excellent condition. 1, white tipped with purplish lilac, dark disc. 2, purplish lilac, with a circle of white round a dark disc. 3, like 1, but more broadly tipped with purplish lilac. 4, light blue, with a narrow circle of white round a dark disc. 5, like 1 and 3, but smaller. All clean looking bold flowers, but irregular and somewhat defective in shape.*

DOUBLE AURICULA: *W A*. Double flowers are not unknown to us, but we have not before seen one like the specimen sent. If a seedling, and it is constant in its character, it will be worth propagating, for though not ranking as a florists' flower, yet it will have admirers on account of its singularity.*

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).

It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*

The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip ...	per lb.	0s. 8d.
Ditto ditto	per qt.	1 0
Skirving's Liverpool Swede ditto, per lb., 8d.	per qt.	1 0
Laing's Improved ditto ditto, per lb., 8d.	per qt.	1 0
Purple-top Scotch ditto ditto, per lb., 8d.	per qt.	1 0
White and Green Globe per lb., 6d.	per qt.	0 10
White Belgian Carrot	per lb.	0 10
Yellow Globe Mangold Wurzel	per lb.	0 8
True Italian Rye-grass	per bush.	7 0
Best English Red and White Clover	per lb., 5d. to	0 7
Large Cattle Parsnip	per lb., 1s. to	1 6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)

PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30s. per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.

All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to
WILLIAM E. RENDLE & CO., Union-road, Plymouth.
ESTABLISHED 1786.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigation, for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

BELFAST.

FLAX-DRESSING MACHINERY.—Persons wishing to put up Mills for Scutching or Dressing FLAX IN THE STRAW, can be supplied with the Improved Machinery recommended by the Royal Flax Improvement Society of Ireland, on application to the makers, MAC ADAM Brothers and Co., Engineers, Soho Foundry, Belfast.—May 4.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.
Direct to JOHN LEGG, Cheltenham.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.
Works, Sumner-street, Southwark-bridge-road.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.
N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12s. to 13s. per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.
N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.
N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.
All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flower-pots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.
Sole agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3l. 5s, to be had of the Maker, Mr. JOHN DAVIS, Optician, Derby. The above is securely packed and sent to any part of the empire.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.
The terms of the School can be had on application either personally or by letter.

TURNIP SEEDS.

W. SKIRVING begs to acquaint his Friends and the Public, that he has no Agent in Town or Country, and that the price of his Improved Swede, and also his Improved Purple-top Yellow Bullock Turnip Seed is this season 1s. per pound. All other kinds of Turnip and Agricultural Seeds in general, of the most select description, at moderate prices. A remittance, or reference, from unknown correspondents, is respectfully requested to accompany orders.
Liverpool, May 4.

The Agricultural Gazette.

SATURDAY, MAY 4, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 8—Agricultural Society of England.
THURSDAY, — 9—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 15—Agricultural Society of England.
THURSDAY, — 16—Agricultural Imp. Society of Ireland.

WE have to acknowledge, on behalf of our readers, the kindness with which so many correspondents have answered our enquiries about AGRICULTURAL WAGES. Some of the results of the inquiry were tabulated in our last week's columns, and the rest of the information received shall be published at intervals.

Some of the statements of wages are accompanied by the intimation that they must be reduced very soon, masters being unable to wait any longer for those better prices of agricultural produce which alone can maintain them; and in other cases it is told us that a considerable reduction has already been enforced. And there can be no doubt that, in the majority of instances, higher wages have all along prevailed in the agricultural districts than would have resulted from the simple exercise of the law of demand and supply, under the circumstances in which agriculture has been placed; so that at any time there has been no other hindrance than the farmer's own will to the reduction of the wages of the agricultural labourer. We could give notice to our labourers of a reduction of wages, to the amount of 15 or 20 per cent. on the present rates, to-morrow; and after, possibly, an explosion of angry feeling among themselves, we have no doubt that they would all be at work again within a week. And the only hindrances, we repeat, to our doing this are the *vis inertiæ* which tends to maintain existing practice—the kindly feeling which shrinks from anything personally injurious to one's neighbour—and the fear of having to pay for an extra number of paupers. The first of these, though of course altogether indefensible, is, nevertheless, with most people of very considerable influence; the second is a feature in the relationship between master and servant, which, in its personal form, is almost peculiar to the agricultural districts; and the third, we have no doubt, has had a great deal to do with maintaining wages above what we believe to have been in many districts an unnaturally high minimum. The first and third of these causes must diminish in influence as food cheapens—the one, because small receipts will very soon check a *habit* of large payments; and the other, because the necessaries of life are now more cheaply attainable. The second cause, we believe, will diminish in its influence upon wages as intelligence prevails; the kindly feeling to which it is due will doubtless prevail and increase, but it will be confined to its own province, and not allowed to exercise itself in the payment of wages for labour, which is a purely commercial transaction. Anything which disturbs the natural exercise of the law of demand and supply must, we believe, in the long run, be mischievous; and unintelligent benevolence, which creates such mischief, and the existing law of settlement, which perpetuates it, are equally injurious in their effects. If, all along, men had obtained only the fair market price of their labour, or of whatever other commodity they may have had to offer, then every trade would have had to maintain just that number of hands which, in its existing condition, and in equal proportion with other occupations, it was at any time able for; and agriculture would not have had dependant upon it that superabundance of labourers of which *in its present condition** it now has to complain. And the remark is as true of farmers as it is of labourers; neither class has anything to complain of the other in this aspect of their relationship; but each has a great deal to complain of those circumstances which, by unnaturally swelling its own ranks, have induced an unnatural competition there.

We believe, then, that a considerable reduction of wages is taking place in the agricultural districts at present, chiefly owing to the diminished influence of those mischievous causes which have maintained the hitherto unnaturally high rates, but also no doubt owing, in part, to the diminished employment which farmers have been offering. We sincerely hope that while the former of these causes takes full effect, the latter will soon cease to operate.

IT is scarcely to be credited that there are still districts in which it is the established custom to grow two white crops after a bare fallow. We had thought that a system so much at variance with every principle of agriculture had been buried with our grandfathers. The Committee on "Agricultural Customs," in their report, mention several places where this absurd rotation is still followed. Still it was to be expected that such practices were local and accidental, until we learn from a letter addressed by Lord LONDONDERRY to his tenantry that this antiquated system is at this day the recognised plan followed on his immense estates.

The following are the rules on which his lordship insists, for the future, that his land shall be farmed:—1. Two white crops shall not be taken in succession. 2. The Wheat land is this season to be sown with Clover. 3. All drained land to be green cropped. 4. "The practice of taking Wheat after bare fallows to be discontinued."

The meaning of this last regulation, unless it be a repetition of No. 3, is not at all clear.

But in what terms are we to describe the management which has been hitherto followed on an estate, where now, for the first time, the owner insists upon the cultivation of Clover between the white crops. This affords matter for serious reflection; for, if upon this estate such a system has been hitherto followed, no doubt the neighbouring lands are in a similar condition. Without any personal reference to Lord LONDONDERRY'S farms, we cannot restrain our astonishment that a rotation which, in some parts of England and Scotland was abandoned 70 or 80 years ago, should yet have a recognised existence even in the remotest corner of Great Britain.

It cannot possibly be that landowners and farmers are ignorant of the advantages of the introduction of Clover and the four-course system. The Clover, as requiring less labour than a corn crop, is one of the most valuable plants the farm produces. Besides, upon a farm where the system of two white crops and a fallow are followed, one-third of the land must always be under the plough; where Clover is introduced only one-fourth. Or upon a farm of 300 acres, 100 acres will be under the plough upon the three-course system; 75 acres will be under the plough upon the four-course system; a difference of 25 acres, equal to the work of one pair of horses, or at least 75*l.* per annum is saved in this item alone.

Nor is this all; it would almost be worth the trouble to visit one of these benighted districts to see how the farmer manages. What does he make his manure from? How does he feed his horses? In fact, how does he manage to carry on his farm at all. Lord LONDONDERRY well remarks in the letter we have already quoted, by such a system "a continued process of abstraction, and a gradual reduction of the good quality of the soil goes on," which will end in the impoverishment and deterioration of the value of the land as certainly as takes place on the removal of coals or other mineral wealth.

A great deal has been both said and written about bad farming, but this reveals to us a more serious practice of mismanagement on the part of the owner. If bad farming be blameable where the tenant is

* We are not discussing the possibility of profitably employing more labour in agriculture; we are only urging the mischievous effect of any other cause, than the natural profits of the business, being at work to attract labourers to this employment and keep them there. We have no doubt that there are few individual farmers who would not profit by the employment of more labour on their farms; and, supposing the command of abundant capital, we believe that the interests of both farmer and labourer will be best served by employing a maximum of labour at a minimum of wages. We do not propose a minimum weekly wage by which, at great ultimate cost to yourself, you would get all the decrepit in body and bankrupt in character upon your hands, but a minimum piecework wage which only good hands can accept; for the most efficient labour is always the cheapest.

perhaps only a yearly tenant, what shall we say in the case of a landowner who must have at least a life interest in his estate. It is no slight palliation to the present low prices if they be the means of forcing landowners into a better system of management. *C.*

HIGH FARMING.

In a former Paper I endeavoured to show by my own experience that high farming is profitable at about present prices; and the prospects of everything about my farm lead me to retain that opinion. But this is a very different thing from maintaining the proposition enunciated in the title of Mr. Caird's pamphlet—High Farming under Liberal Covenants the best Substitute for Protection—a proposition which I will endeavour now to show is far too general. The proposition which Mr. Caird and other high farmers have successfully proved is this—that high farming under liberal covenants is a sufficient substitute for protection to the few who are likely to practise it.

Mr. Caird says, "it has been suggested that, if high farming were universal, the supply of food might so increase as to render the system unprofitable. We fear, on the contrary, that a want of capital, on the part of both landlord and tenant, will prove, as hitherto, a serious obstacle to its extending with sufficient rapidity to keep pace with the demands of our increasing population." Here the weakness of the high farming theory as pointing out a general remedy for agricultural difficulty is stated almost in so many words. It is evident that if the practice were universal, the consequent extremely low prices would render it unprofitable. On the other hand, if it were not universal, then high farming would of course be no benefit to those who did not practise it. The advice then to farm high is not a sufficient answer generally, though it may be in particular cases, to those who complain of farming profits. It is either generally impracticable, or, if generally practicable, then would be unprofitable. This is a very important view of the question. If I am not mistaken the propriety of what is called high farming—that is, fattening large quantities of animals—of largely increasing produce prior to the discovery of the means of largely diminishing the cost of production—has been too eagerly advocated. When a manufacturer finds his produce likely to be permanently reduced in price from some cause or other over which he had no control, we don't find him forthwith increasing his produce. He either invents new machinery, which shall enable him to produce at less cost, or he quits the manufacture. Analogous to this must be any general remedy for permanently reduced agricultural prices. If we cannot invent machinery, in the strict sense of the word, adequate to the occasion, we must discover or adopt new processes or methods of agriculture, in which the cost of production shall be reduced, without reducing the rate of the wages of the labourers—a thing which is neither desirable nor possible in the face of an increasing demand for their services in almost all non-agricultural employments.

Again, this question is important, because, though high farming will be impracticable generally, owing to a want of capital, yet it is quite possible that, as often in past times other trades have suffered from over-production, and agriculture too under the artificial stimulus of unduly high prices, so it is quite practicable for high farming to become sufficiently general to make prices, if not unprofitable to the high farmers, still seriously so to all the rest who continue in the old way. Thus, suppose only one-sixth of the land to be cultivated in some such way as that of Mr. Caird. The produce of this sixth might, as that gentleman shows is done in his case, be increased threefold. This would increase the whole produce of the country one-third. But, according to all past experience, prices fell much faster than the increase of produce which may happen in the course of a year or so. So that it seems no unreasonable thing to imagine that high farming extended over no more than one-sixth of the farmers might cause a reduction of 33 per cent. in prices, a reduction which would be pretty much like ruin to the other five-sixths. Probably it is too extreme a supposition that one-sixth of the land could be brought under high cultivation in a sufficiently short time to produce such great reduction in prices as that, but the illustration serves to show there is some force in the argument which Mr. Caird has somewhat illogically encountered.

Far more probable, however, is it that a want of capital, on the part of both landlord and tenant, will render high farming impracticable over a wider extent of land than the increasing population will keep up with. The problem then will still remain to be solved, how farming shall be made profitable at low prices to the great majority who cannot adopt what is called high farming. I suspect this problem is capable of being solved in a great variety of ways, but that no one uniform system of husbandry is able to meet the case. One system, however, I think capable and worthy of extensive adoption, and have in a former Paper called attention to it. I allude to the system of Jethro Tull. This may be called cheap farming. I am disappointed that my communication on the subject elicited no remarks in the *Gazette*. My experimental acre is looking beautiful. On part of it the Wheat constitutes the third successive crop, and there it looks the best, but I fear I drilled it too thick. But this I am satisfied of, that 3 quarters to the acre under this system will pay me better than 5 quarters under the high farming system, pursued as stated in my former paper. The question is, can I get 3 quarters? I must solve the problem by trying, but discussion would have helped me, if I could have got it, by giving information or correcting errors. *Amicus Tull.*

HIGH FARMING IN AYRSHIRE.

The lands of Myremill are situated in the parish of Maybole, about nine miles from Ayr. The occupation of the tenant, Mr. James Kennedy, extends to 560 Scotch, or 600 imperial acres of arable land, the property of P. W. Kennedy, Esq., of Drummellan. The whole has been drained, and latterly a considerable portion of it, where the shallow system had been practised, has been re-drained 4 feet deep. This is now Mr. Kennedy's minimum depth. The soil is various. Where Myremill houses are situated it is naturally thin, and resting on a tenacious till. There is little level land on the farm. What is level is partly improved moss, and the remainder rich alluvial soil. The largest proportion is of medium tenacity, and has been well cultivated for a considerable length of time.

The buildings of Myremill are situated on an elevated, though not the highest, part of the farm. The old steading was tolerably suited to the green crop system as commonly followed; but was far from being sufficiently commodious for the soiling system and other improvements which the proprietor and tenant, about a year and a half since, mutually agreed to carry out. An additional extensive range of buildings has accordingly been erected. The first of these to which we were conducted was the forage house. It is 66 feet in length, by 22 in width. Turnips and other food for present use are stored here, and there are two wide carriage entrances to it. It is floored with tiles. The hay-cutter and Turnip washer and cutter are placed in it, and are connected with the steam engine at the other side of the court by an underground shaft. The hay-cutter is by Mr. John Cornes, Barbridge, and cost 14*l.*, exclusive of the gearing. We were much pleased with the Turnip washer and cutter. The washer externally has the appearance of a revolving cylinder hung at a considerable inclination. The inside fitting is that of a screw, and there is plenty of water run into it from a pipe. The Turnips are thrown in at an opening in the upper end of the cylinder in twos or threes at regular intervals; but the individual at work is kept busily employed. The turning of the cylinder causes them to revolve round the axis in the spiral convolutions until they reach the other end, when at the same regular intervals —once for each revolution of the cylinder—they are thrown out washed, and are then carried up by elevators on a gutta percha belt to the cutter, which finishes the work. One person to throw in the Turnips and one to shovel them out from below the cutter, will, with the aid of these mechanical contrivances, prepare a day's Turnips for 200 cattle in less than an hour and a half. We regard the washing of Turnips as of great importance with the heavy soil and soft climate of Ayrshire. By these contrivances it is easily effected; indeed it would require the same number of hands to attend to the cutter alone without washing. The Turnip waggons are altogether of metal. They have four wheels with movable axles like that of a carriage in front, so as to turn easily. The cutters with gearing, &c., are so constructed that they can be removed during summer when they are not required, and the house is used for the green food.

The two new byres run at right angles from the side of the forage house. Their width is just equal to its length. In each of the byres, 52 cattle are placed in two rows, with a centre passage—6 feet wide—and a passage at each side before their heads—4½ feet in width. There are three doors from the forage house to each byre, corresponding to the passages, and one at the other end from the centre passage, opening to the manure heap. The passages and the stalls where the cattle stand are paved with tiles laid with mortar upon sand, the same as the floor of the forage house. It forms quite a smooth walk for running the feeding waggons upon. Under each of the bullocks, the tiles are laid in a slightly concave form, and the lowest of these in the centre is perforated with holes, through which the liquid of the animal is drained to the pipe underneath, which communicates with the tank. Tunnels, 3 feet square, for the admission of air, are constructed under each of the four walks in front of the cattle. There are gratings outside to admit currents of air at both ends, with boards to regulate the admission of the air. There are also air gratings over the tunnels opposite each stall of cattle. The impure air escapes by ventilation in the roof. There is a substantial stone trough before each animal, with an opening from the one to the other, about 6 inches from the bottom. By connecting the troughs at the upper end of the byres with the water pipe, by means of gutta percha hose, the whole of the troughs are filled to that depth without more trouble. The plentiful supply of water in the pipes admits, likewise, of the drains which carry off the liquid manure to the tanks being flushed three or four times a week, or more frequently, if it be thought necessary, so that there is no danger of their choking. On entering these byres, one feels agreeably surprised alike by their extent and their clean tidy appearance. They are each 94 feet in length by 33 feet in width and 11 feet in height. They are lathed and plastered over, and the camsiled roofs with rows of ventilating sky-light windows at each side, give them quite an airy appearance. The two byres are stalled for the accommodation of 104 cattle, and as filled at present, from the clean and quiet state of the animals, have all the appearance of comfort and rapid improvement. The largest stalls are 7 feet 10 inches by 7½ feet, and they are gradually made less, so as to be suitable for different sizes of cattle.

The plan of box-feeding is carried on in two other houses, which contain nearly 40 head of cattle. It has been frequently urged that box-fed cattle must, of necessity, be kept in a filthy state. The inspection of the boxes at Myremill convinced us of the groundlessness of this objection, as the cattle contained in them were as sleek and clean in the skin as those in the stalls. To our view, the chief objections to the system are, that it requires a greater extent of housing and more litter, and the work of feeding is not so convenient; and as the liquid, instead of running to the tank, is completely absorbed by the litter, it causes a greater amount of cartage, and gives less work for the steam-engine. Mr. Kennedy's boxes, which are constructed for the accommodation of two cattle each, are 13 feet by 10 feet. It will thus be seen that a building which is large enough for 20 cattle in boxes, would contain 30 in roomy stalls. And it is asserted by Mr. Huxtable, with appearance of reason, that straw, though it contains but a small proportion of nutritious matter, may be used to better purpose than by being trodden down for manure. By cutting it for mixing with cooked food in winter, and the quickly-grown succulent Grasses in summer, its mere bulk is of advantage for filling the capacious stomach of the ox, and causing him to ruminate more; and it is at the same time useful from its slightly astringent effect on the bowels, which are apt to be over-laxative from the free use of Turnips or Italian Rye-grass. Taking all these considerations into account, we think that the system of stall-feeding should be preferred in all plans for the building or remodelling of steadings.

There is accommodation altogether for 150 fatting cattle at Myremill, and Mr. Kennedy can put up 80 more at his out-farms. He has sold 300 fat since harvest, and bought others in their stead. And the cattle are brought into a condition in which they realise the highest market price. To those who feel an interest in such matters it certainly is no ordinary treat to see these large buildings filled with fine cattle in a thriving condition, and all the operations connected with them going on like clockwork. There are few places we presume where such an extensive and well-conducted manufactory of beef can be seen.

The cooking-house for the cattle is floored with tiles as already described. On one side of it are arranged four large boilers, in which linseed is cooked by condensed steam from the engine. About half an hour suffices for this. As soon as it is prepared, it is thrown in a hot state over cut hay, chaff, Bean-meal, and bruised Oats, or whatever is used for mixing at the time. The whole is allowed to lie on the floor, according to the plan of Mr. Warnes, until the dry chaff or hay absorbs the mucilaginous matter of the linseed. The ordinary feeding at present used is, for each fattening animal—about 50 lbs. of cut Turnips at 5 A.M. At 11 o'clock, 15 to 16 lbs. of the cooked food, followed by a little dry hay. At 5 P.M., another 50 lbs. of cut Turnip and hay or straw, after which the cattle are littered up for the night. The granary is over the forage house, with a flight of steps outside. It is well lighted and aired, and also, we are happy to say, well filled, notwithstanding its great extent. Immediately connected with the engine is a machine for bruising corn and linseed. It was constructed by Mr. John Young, of Ayr, and it does him much credit, as we have not anywhere seen this description of work more efficiently performed. In the same building there is also a circular saw for cutting wood for farm purposes.

The entire drainage of the steading is carried in the first instance to a small cesspool, where any sediment it contains settles to the bottom and the liquid flows into a tank at hand. This tank is 48 feet long, 14 wide, and 15 deep. The second tank is of the same length and width, and is 11 feet deep. The tanks are formed by digging out the earth, building the sides without puddling, as the stiff subsoil does not require it, and arching over the top. The two are capable of containing upwards of 100,000 gallons. The liquid manure is pumped by the engine from the first to the second tank, where it is diluted with water, according to its strength and the state of the weather, and is made ready for being discharged upon the fields. It is obvious that a steady supply of water is required for this and the various other purposes about the steading. Such has been obtained by bringing it in pipes from a higher level, at a distance less than a mile.

Cast-iron pipes have already been laid down for conveying the liquid from the tanks to 350 Scotch acres of land. There are stop-cocks in the centres of the fields, generally for each 10 acres of land. To these, when a particular field is to be manured, gutta percha pipes are attached in lengths of about 30 feet, and a hose at the end for discharging the liquid over the field. The operation is begun at the centre by describing a circle round the cock, which circle is gradually widened by adding to the gutta percha till the whole field is taken in. Before gutta percha came into use, a few years ago, such a plan could not have been adopted. It is the only substance known which combines the essential requisites of strength and flexibility. When we saw the process in full play on Friday, the jet from the hose was discharged to a distance of 120 feet, and the steam engine, which is of 12 horse power, was working a powerful threshing machine at the same time. It fell like a heavy shower over the ground, saturating it in an evenly manner. A man to direct the jet, so as to attain an equal distribution of the manure, and a

boy to assist in moving the pipes, are all that are required on the field. In this manner the steam-engine and force-pump will manure 10 acres of land in a day, throwing on from 8 to 10 tons per acre. There is no danger of the pipes suffering from too high pressure, though an obstruction should occur to prevent the efflux of the liquid. A strong cast-iron apparatus, of a globular form, connected with the pipes, and air-tight outside, is placed near the engine. When the pipes are full, and the engine still at work, the liquid is forced towards the globe, and when the pressure comes up to a certain degree of force, the compressed air acts on the safety valve of the engine, and the liquid, no longer impelled, runs back along a conduit into the tank.

When the engine, the pumps, and the pipes are thus in complete order, it is evidently of great importance to make them do as much work as possible. An attempt is to be made at Myremill to dissolve a large proportion of the solid manure and force it through the pipes, and thus effect a great saving of manual and horse labour. The bullocks which are so well provided with a clean dry bed, will receive as little litter as possible, and the manure which is thus made, almost free from straw, will be conveyed to a large tank and dissolved with water, or, at least, brought to such a degree of thinness as, it is expected, will admit of its being pumped out. A large additional tank is laid off for this purpose, alongside of another new one for liquid. The two will be capacious enough to hold 200,000 gallons. If this plan succeed, and we can see no formidable objection to it, it will cause a great saving at that busy season—the time of Turnip-sowing. Besides this, what is to prevent Mr. Kennedy from watering a field at sowing time, and thus, by a day's work of the engine, he may obtain a Turnip braird in a droughty season over 10 acres of land, and increase the crop by 50 or it may be 100 tons? It is altogether a great advance in the way of high and economic cultivation.

We can scarcely indicate the course of cropping which is likely to be adopted at Myremill. The system points to an extensive growth of the succulent Grasses and roots, for which our island climate is so suitable. A great number of cattle may thus, at all seasons, be fed, rich manure made, and the land brought to a garden-like state of fertility. As yet, Mr. Kennedy is but feeling his way: but, from the result of trials already made, he will be induced to sow annually a considerable breadth of Italian Rye-grass. A field of 10 Scotch acres, which produced a Turnip crop in 1848, was sown with Dickenson's Italian Rye-grass in April, 1849. Towards the end of May, when the Grass had come up, it was dressed with guano. It will be recollected that the month of May last was very cold and backward, and it was near the beginning of July before the first of it was ready to cut. During the next three months the field, by cutting and soiling, afforded feeding to 80 fatting cattle and 20 horses. In addition to the Grass, the horses had two feeds of Oats, and the cattle 4 lbs. of oilcake, daily. The whole of the field was cut three times, and a part of it four times. The land from which each day's Grass was taken was manured with liquid in the afternoon, as at Sutton Waldron and Auchness. This year the same field will yield a good cut by the end of April, and the manuring can be kept up more efficiently now that the pipes are laid down. As an evidence of the good feeding qualities of the Grass, it may be mentioned that 20 of the cattle which were purchased at Ardrossan tryst last year, and fed on it, gave 50*s.* a head of profit for six weeks' keep. At the time when the cattle were accustomed to it they would not eat red Clover.

The reader may wish to have an idea of the cost of remodelling and extending the steading and the other works in connection with the scheme. This is of essential importance in forming an estimate of the plan, as its merits must be ultimately tested by the question of profit. We are not prepared to enter minutely into figures, but may state generally, that the cost of the pipes is from 30*s.* to 40*s.* for each Scotch acre within their range; and the entire expenditure on houses, tanks, engine, pumps, pipes, rails, &c., is not much more than would suffice to thorough drain the land. Such an outlay should not discourage any liberal landlords, who may have thoughts of making a similar experiment: and it would be very much for the interests of agriculture that a number of others should be made in different parts of the country, as people in general are most satisfied with results of which they have been personally cognisant. After seeing the extent and excellence of the works at Myremill, we were a little surprised on learning that the expenditure was not much greater than it really is. The byres, for instance, which we have described, and the plan of which we would recommend for adoption wherever fatting of dairy stocks are kept, cost very little more than common erections for cattle throughout the country. The usual calculation for slate-roofed byres on extensive estates in this neighbourhood, is 5*l.* for each head of cattle which they have space to accommodate. Those at Myremill cost 6*l.* per head: and when we consider the benefits to be derived from good lighting and thorough ventilation—the facility of labour by the smooth, wide, durable walks—and the comforts of dryness and cleanness to the animals—the advantages joined appear to us much more than commensurate with the additional outlay.

When instances of high-farming are promulgated, there has been a tendency of late to view them through a political medium. This is to be regretted, in so far as it prevents people from considering the subject dispassionately, but even this feeling has given rise to a more widely spread spirit of enquiry, and in this respect will be productive of good. The advocates of progress may be assailed and browbeat on all hands, but there is little danger that the onward tendency of the age will receive any serious check from the evanescent bitterness of politics.

We are sure that our readers will join with us in heartily wishing that success may crown the great experiment, of which we have endeavoured to give a slight outline. The friends of progress, everywhere, are under a debt of gratitude to Mr. Kennedy of Drummellan for the magnificent example he is giving of what science and art can do for the advancement of agriculture. *Abridged from the Ayr Advertiser of April* 11.

Home Correspondence.

Application of Steam Power.—The answer to your subscriber's letter respecting the best mode of applying the power of a steam-engine to general agricultural purposes will be—Let him get a steam-engine of the size he mentions and put a large pulley on the fly-wheel shaft; let him then in a suitable part of the barn put up a shaft with a pulley opposite the one on the fly-wheel, which shaft he can then turn by a belt made of gutta percha, which is the best material for the purpose. On this shaft he can put various pulleys, of such sizes as he may require, and by putting pulleys on the different machines to be turned he can work them all with belts. He will have to calculate the size of his pulleys so as to attain the requisite speed; thus, supposing the engine makes 80 revolutions a minute, the pulley on the fly-wheel shaft being 30 inches in diameter, and the pulley on the working shaft 12 inches, this shaft will make 2½ revolutions for one of the engine, or 200 a minute. Now, to work a threshing-machine, which should make 800 revolutions a minute, he must put a 4 feet pulley on his shaft, and a 1 foot pulley on the shaft of the drum of the threshing-machine. Or to work a chaff-cutter which should make 100 revolutions a minute, he must put a 1 foot pulley on the working shaft, and a 2 feet one on the chaff-cutter. To steam the Flax he must have a valve attached to the boiler, which will turn the steam into the pipes put round the Flax. I have here a six-horse power engine doing all this, and a Flax rolling and Flax scutching mill of the most improved construction, all of which I wish to dispose of at a very low price, as I am giving up this farm. Perhaps your correspondent might like to purchase them, as they seem to answer his description. *Henry Crockford.*

The Progress of a Storm.—Having an engagement about 25 miles from home on the afternoon of Thursday, April 4th, I had an opportunity of observing the course and velocity of the progress of storms ashore, which does not often occur. The previous night had been one of most violent tempest; a gale from south-west, commencing at noon of the Wednesday about south, and shifting gradually round to the west, accompanied by torrents of rain, till noon on Thursday, at which time the rain having ceased, and the blue sky glimpsing out occasionally, I set out on my journey, travelling in a direction about north-east. However by 2 o'clock, having gone 14 miles, I found the day rather got worse than better, the blue sky disappeared, and the flying scud of the morning seemed to settle down again into rain. I therefore availed myself of the hospitality of a friend by the wayside, to rest my horse till 3 o'clock, by which time the sky had become blue again, the sun shone out cheerfully, and I started once more, expecting a pleasant drive. But, no; to my surprise, in less than half an hour, the haze came on again, the clouds thickened around me, and soon after 4 o'clock I arrived at my journey's end, just in time to escape the drenching of the stormy evening which was closing in upon me. The interval between my arrival and the sounding of the dinner bell was so engrossed by an animated discussion on the merits of your friend "Porcius and his Pigs," that we quite forgot to think of the weather, that interesting topic of all Englishmen, until we were hurried away to make a hasty toilette, when looking out at the storm I expected to see, to my surprise I was gladdened with the brightly sinking sun, whilst in the north-east alone the dark bank of clouds showed that my course had followed the storm, and that the variations of weather which I had experienced during the day were due to the unequal pace with which I had followed the march of the tempest's track. *F. P. B. M., April* 6.

Garden Allotments.—Will any of your numerous correspondents be kind enough to answer me the following queries relative to garden allotments in agricultural districts, and give me any hint by which the system may be made to work advantageously. The amount of land let out in allotments to the poor? At what rate per pole [5½ yards square] it is let? The quality of the land when first let out? Its present quality? Does the system work well for the poor? The average amount of poor rates before the introduction of the allotment system? The present amount of poor-rates? What quantity of land is allotted to each family? The usual number of labourers out of employ before the system was introduced? The present usual number of labourers out of employ? How the farmers regarded the system when first introduced? How they look at it now? Its moral tendency. *R. G., April* 15.

Cattle Feeding.—With reference to my statement of the 2d March last (*Agricultural Gazette*, p. 139), I have been presented with the following valuation of the manure, on the principle deduced from the very extensive and elaborate experiments of Mr. Lawes,—that the nitrogen carried off by the butcher in feeding stock is equivalent to the difference between that element and ammonia, or to the hydrogen which enters into its composition in the formation of the latter; the computation will therefore stand thus:

	tons.		lbs.
Meal, bran, and Pollard	155 = 347,200 at 3 per cent.		10,416
Straw	153 = 342,700 „ ½ „ „		1,714
Hay	84 = 87,160 „ 1 „ „		872
Mangold Wurzel	340 = 761,600 (388 lbs. at 1 of nitrogen.)		2,253
Swedes	90 = 191,600 (4¼ lbs. per ton.)		382
Green crops, and after feed, 56 acres, estimated as dry at 1½ ton per acre	84 = 188,160 at 1 per cent.		1,882
Slaughtered stock, offal, and blood, 10,000 „ 10 „ „			1,000
Left on the land the tops of Mangold Wurzel, 105 tons, at 13 per cent.			1,365
Tops of Swedes, 30 tons, at 10 per cent.			300
Coal ashes			—
		lbs.	20,184

20,184 lbs. of ammonia at 6*d.* will amount to 504*l.* 12*s.*, so that, on the moderate computation of the above, my prospective crops will have to be charged with this sum to the credit of my cattle and green crops of 1849. But even allowing for a considerable loss by evaporation, or from other causes, there will remain an immense amount of carbonaceous and alkaline substances, and all the phosphate of lime—which was not required in the animal economy. I think we may safely conclude that by proper management of stock, on an average of seasons, there is no cheaper way of maintaining or increasing the fertility of our soils, than by a large consumption of purchased food, aided by the root and green crops of our farms—provided we economise the manure, which is rarely done. Every day's experience convinces me that the cooking and preparation of our straw, hay, meal (and possibly our roots), is essential to the profitable feeding of our animals; but more of this hereafter. *J. J. Mechi, Tiptree Hall, April* 18.

On Farm Buildings.—It has often occurred to me that it would be very advantageous to have a second floor over the whole ground area of a farmery, and standing on cast-iron pillars, which would also support the roof of corrugated iron. On this second floor every sort of food would be prepared, and let fall from it upon the places where wanted for use. For this purpose there will be laid a number of railways on which light waggons will run and convey the articles to the proper places. The steam power of the threshing machinery will be the "primum mobile" of the whole concern; the making of the power will be done on the ground, and the scutching apparatus will be on the second floor. The unthreshed corn will be raised to the second floor by means of travelling carriers, and also the roots, as Turnip, Beet-root, and Potatoes. Cutters for hay and straw may be placed on one side of the threshing power, and for roots on the other, and all impelled by the agency of steam. Being laid in depôts, the chaff and sliced roots can be conveyed to any place on the railways, and let fall from the waggons into the cribs and mangers. Litter in the shape of uncut straw will be deposited in the same way over the yards. This idea arises from the practice of millers raising aloft the crude article of manufacture, and letting it fall to the ground in the condition of use. A descending body is always easily commanded, and can be made to pass through any number of performances before it reaches the ground and requires to be again raised. The latter should never occur; the reaching of the ground must finish the process and terminate the labour. *J. D.*, 1849.

Geological Specimens.—Mr. Downes, of Wickham Market, Suffolk, would be glad to effect, through the medium of our "Notices to Correspondents," an exchange of geological specimens. He would be happy to change shells and other characteristic specimens from the crag, and other members of the tertiary formation, for those from other deposits.

Savings.—The necessity of provident habits cannot too often be impressed on the labouring classes. When some are spoken to on the duty of saving a little in the day of health, and when employment may be had, they at once admit the propriety of doing so; but objections are started, and the most common one is, that "the sum they can save is so small that it is not worth while beginning." In answer to this objection, the old saying may be stated "take care of the pence, and the pounds will take care of themselves." The result of adding together the littles has often been the astonishment of those who began with the intention of saving a few pounds, but who, in the course of a few years, with the regular addition of interest, were able to look at their account with the sum of 10*l.* or 20*l.*, or even a larger amount due to them. Among the labouring classes, in the time of employment, few are without the means of saving something. It is often foolishly said, that those having small wages cannot be expected, and are not required to save; but it is a melancholy fact, that it is not those who have large wages who save most. The reason of this is, that being accustomed to plenty, they do not put that value upon their means which they ought to do, but recklessly spend their income in sensual pleasure, and frequently in extravagance and folly. It is no uncommon thing to find a man in regular employment, receiving perhaps 20*s.* a week, whose wages are required, as soon as received, to pay off his debt in a shopkeeper's book, so that he has seldom a shilling at his command. On the other hand, there are many whose earnings do not exceed 12*s.* a week, who, with habits of economy and self-denial, lay past a part of their income—their names are not to be found in the books of any shopkeeper—they can even lend assistance to some poor friend or neighbour, and

their hand is not shut against the claims of religion and benevolence. It is not only the duty, but the interest of the labouring classes to use every means in their power to induce their fellow-workmen to save; for improvident men do great injury, not to themselves only, but to others also. A labourer, by saving what he can in a time of health and prosperity, may avoid much suffering and privation, and secure many future benefits for himself and his family. And I would recommend the distribution of a little tract, by Mr. Hatton of Reading, already noticed in our columns, by those who are desirous of forwarding this work, and who feel an interest in the welfare of our rural population. It has already reached an extensive circulation, and is supplied at a cheap rate. I do not hesitate to affirm that if men can be brought to understand their own interests, and to apply themselves courageously to improve the means within their reach, they cannot fail of success in bettering their condition. *M. S.*

Wages.—Having lately become a reader of your valuable paper, I have seen your allusion to the circular of queries respecting agricultural labourers, and believing that whatever tends to elicit truth in this as on most other subjects, may prove advantageous, I venture to offer the little information I possess on the subject. I have been so circumstanced during the last 13 months as to make observations and comparisons in three different localities. 1st, In the north of Nottinghamshire, where a regular system of improved agriculture is adopted; 2d, In the southern part of the Weald of Sussex, where many of the holdings are small and cultivated upon no regular plan; and lastly, in Surrey, within seven miles of the metropolis, where of course a state of things differing widely from the two former exists. In Nottinghamshire the wages of regular labourers were 12*s.* per week; house rent moderate, a cottage and small garden from 3*l.* to 5*l.* a year, and coals 12*s.* per ton. In the village where I resided, a considerable number of half-rood allotments had been let to the labourers at farmers' rent, which were by many highly appreciated, though being some distance from their homes was found to be a disadvantage. There were opportunities for good hands to earn considerably more than 12*s.* at piece-work, such as Wheat hoeing, at 3*s.*; Turnip hoeing and singling, with the help of a boy or two girls, at 4*s.*; mowing Clover and Grass at from 2*s.* 6*d.* to 4*s.* 6*d.* per acre, without beer. In harvest, mowing Wheat, Barley, and Oats, at from 6*s.* to 9*s.*, that is, mowing, binding, stacking, and raking—none of the corn being led home in the loose state. The heavier crops of Wheat are reaped with the sickle, generally by strangers, at 9*s.* to 13*s.* per acre. Most of the corn is threshed by machine, Barley occasionally by hand at 2*s.* per qr. One-fourth of the arable land being constantly under Turnip culture, a considerable amount of labour is required in the attendance of stock in the winter, consequently the demand is much more equal throughout the year than is the case where the same system cannot be, or is not adopted. A flock of 300 sheep requires a man and two boys, the man receiving 13*s.*, and the boys 3*s.* 6*d.* each, the whole of the Turnips being cleaned and cut with Gardener's cutter. The price given for taking up and cleaning Turnips is about 8*s.* per acre; women are frequently employed at this work, and when by the day of 7 or 8 hours work, receive 10*d.* When the warm weather commences in the spring, a large number of fat sheep are shorn weekly for market, which is a branch of employment at which good hands may earn 4*s.* or 5*s.* per day. In one instance 5*s.* per score was paid for belting, washing, shearing, washing and drying the locks, and stowing away the wool. Attending to fatting cattle is another branch which affords winter employment, each farm having one or more hand so engaged at 12*s.* or 13*s.* per week. The men employed with the horses are mostly single men, boarded and lodged at wages from 8*l.* to 20*l.* a year. When a married man is kept as foreman, his wages would be from 14*s.* to 18*s.* per week, and often with house rent free; these men work early and late, in summer time being expected to be with their horses at 4 o'clock in the morning, and to take them out at 6. The neighbourhood is well supplied with schools, and the best educated are, I believe, found to be the most valued servants. The wages in the part of Sussex of which I speak, are from 10*s.* to 12*s.* per week. House rent 5*l.* a year, and coals 22*s.* per ton. The demand for labour irregular, and consequently greater temptation to commit depredations, which occasionally occur. The labourers in this part of Surrey, being so near London, are consequently, some of them at least, not strictly agricultural, and not very efficient; those of this class are only occasionally employed by the farmers. There are some good hands who readily find employment at from 14*s.* to 16*s.* per week. Coals are 22*s.*, provisions high, and house rent from 8*l.* to 10*l.* a year. The only experience I have hitherto had of the price of piece-work in this county is hay-trussing and draining; the former is neatly bound and weighed for 3*s.* per load. The draining we have had done has been from 30 inches to 3 feet deep, at 4*d.* to 6*d.* per rod of 5½ yards; the subsoil clay, and occasionally gravel; removing the sod and replacing it; also placing thorns over the pipes in clay subsoils, and damaged hay in gravel or loose sand, to prevent the sand from washing into the pipes. The allotment system has been adopted here to some extent from benevolent motives, and appears to be much valued by the working classes. The character of the labouring class for sobriety and economy does not stand high; there are exceptions, and some are glad to avail themselves of the opportunities offered for the education of their children. There is a working-man's institution, with a reading-room, where a number of newspapers and periodicals may be seen, as well as other books for circulation amongst the members; lectures are occasionally given, and it appears to be in a prosperous state, though I do not hear that many agricultural labourers avail themselves of the advantage. I am inclined to think that young men employed as farm-servants or as day-labourers, throughout the country, exhibit a great want of inclination to read, and perhaps the nature of their employment has much to do with it; but perhaps it is worth inquiry, if there are no inducements to be offered which have not yet been presented to them. I need say nothing of the advantages which would arise from increased intelligence in that important class of the community. If I am able to give you further information, likely to be of service, I shall have pleasure in doing so. *Thomas Woolley, Clock-house Cottage, West-hill, Wandsworth.*

Prices of Agricultural Labour.—The following are added on to the list published last week:

	No. 1.	No. 2.	No. 3.
Present wages of men per week	10s to 12s	12s	9s
Wages during harvest month	...	12s to 15s	15s to 18s *
Wages of female labourers	10d to 1s	1s	10d to 1s
Mowing Clover per acre ...	3s to 3s 6d	2s 6d	2s 6d to 3s 6d
Mowing Meadow grass ...	3s 6d to 5s	2s 6d	3s to 4s
Reaping and tying Wheat...	9s to 10s	10s	8s to 10s
Threshing Wheat per bushel	6d	6d	6d
Digging drains 42×14×3 ...	...	3d	...
Cottage rent	...	78s	4l to 5l

* With beer.

No. 1 is from Mr. Whittem, of Coundon, Warwickshire; No. 2 is from Cumberland; No. 3 from Mr. Yool, of Beacon's-field, Buckinghamshire.

On the Qualifications of Farmers.—A few weeks since there appeared in your columns some remarks on the qualifications of gardeners, and your correspondent suggested as a means by which the really professional gardener should be distinguished from the flock of those whose pretensions to the title are but too palpably equivocal; that he should qualify himself by undergoing an appointed examination before a properly constituted board, much in the same way that young men are entitled to practice physic or surgery by the possession of a diploma of the Apothecaries' Company or the College of Surgeons. The idea is very good, inasmuch as the principle which it involves is that which long experience has taught is the best that can be applied for the protection of the public against fraud, and for the elevation of a very numerous and important class of men; while the advancement of science in that department would be marked by much better results than can possibly occur under the present system. But the principle contained in your correspondent's suggestion may be likewise extended with advantage to a larger and more influential body of men than even gardeners, and in its ultimate effects must be productive, in proportion, of a far greater amount of real benefit. A great and laudable effort is everywhere making at the present day for raising the intellectual and social position of the farmer, and it is gratifying to observe model schools and colleges springing up on every side, professing to have for their object this desirable end. Agriculture is, in fact, taking up a very high position, and it is to be hoped that the time is not very far distant when we may see as tillers of the land a body of men in no respect inferior in high intellectual acquirements to the members in either of the faculties of Divinity, Law, or Physic. But desirable as it would be, such a consummation can scarcely be brought about, whilst there exists no standard by which to judge of the qualifications of the farmer. In the faculties above alluded to, an ordeal of no ordinary kind has to be gone through before the candidate is considered properly suited to fill the office for which he aspires, and stringent penal enactments protect the public from imposition and the profession from degradation. Their salutary effects being universally recognised in the integrity and learning of the great body of men who are members of these faculties. Do any valid objections exist for not following such examples in the case of farmers? I think not. I believe there is ample room for carrying out a similar plan, and it only requires a proper and liberal spirit to justly appreciate the value of such a requirement, to discover the materials ready at hand, waiting only the impress of a master mind to model them into an institution, which must prove of incalculable benefit to the farming interest, the greatest possible security to landlords, and the means of placing the tenant on a far higher and better footing than he can ever hope to attain under the present regime. *Iota, Cirencester, April 24.*

Agricultural Labourers.—It is much to be regretted that farmers should be, as they too often are, unable or unwilling to employ, to pay, and to accommodate their labourers as liberally as good ones are worthy of. The consequence of this is, as with the farmer who is not encouraged in his efforts to improve his farm, that the best labourers, being treated no better than those who are less worthy, the good ones either emigrate to other counties, where industry is better rewarded, or they too commonly sink down into the ranks of the careless, the idle, and the profligate. This is in my humble opinion a very important matter, and a subject vitally connected with the welfare of the farmer, as well as the labourer, and well worth the consideration of the landlord, the philanthropist, and the statesman. *An Old Farmer.*

The Landlord part of Agricultural Produce.—Lately I have heard such different amounts stated as the proportion which belongs to the landlord out of "a quartern loaf," which means I suppose a loaf of 4 lbs. weight, and not myself, through ignorance of the costs of manuring, ploughing, and in short preparing the land for the Wheat, as well as the quantity of water used by the baker, &c., that I shall feel much obliged if you will settle this question. We will suppose the land lets at 20*s.* per acre, and the bread to be worth 4*d.* Perhaps the "Old Farmer" who gave us a specimen of what he can do, in page 235, and tells us that he does not like to be a mere idle looker on, and wishes to make himself useful, will employ his time in making such calculation. I am convinced the work will do him nothing but good. *Murphy.*

On Farm Horses.—All intelligent scientific observers have stated their opinion of the very undue preference that has been constantly given to heavy carcases of the stallions for farm purposes that have been exhibited at the shows of the Royal English Agricultural Society since the commencement of that institution; and it must be acknowledged that the observation is very just and true, and appeared most conspicuously at Newcastle in 1846, and at Norwich in July of the last year. The first prizes were awarded to short heavy fat carcases, wherein the only properties were weight of offal and an abundance of muscular fibre, loading every exertion and encumbering every step of the animal; and at their sides have stood the lengthy active carcases that befit the work of the farm, and the spirit that moves and impels the whole machinery. There cannot possibly be a greater mistake than having heavy fat animals for the purposes of the farm. The very first point of all superior breeding is, to get quit of the superfluous offal, both in fattening animals, and in those for the use of draught and the road. In the former case, the articles are useless to the butcher; and in the case of horses, the animal is burdened with a superfluous weight, which promotes perspiration, and debilitates the muscular action. The body of a farm-horse should be comparatively light, round—the offal must not show any suspension below the level of the fore ribs, but rather rise upwards. The thighs must be deep and sinewy, and the legs flat in the bone, and little hair at the heels. The neck long, lofty, and well arched; the head small, and tapering to the muzzle. The whole animal should be a "racer," enlarged to the size that is capable of bearing the burdens and fatigues of farm-work. Very widely different are the figures to which the prizes are given. The sole object seems to have heavy fat carcases fit for the shambles, without any regard to spirited action or quickness of step. Heavy bodies are killed by their own movements, and by the effervescence that takes place in such a collection of fleshy materials. Muscle and not fibre is required in the horse, and the latter must be present only in the quantity that is sufficient to bind the muscular frame in the due elasticity and vigour. Any greater quantity only creates a burden, and forms a useless appendage. The best farm-horse would be got by a cross between the largest blood-horse and the choicest country mare that can be found. The size must be large on both sides, and the figure handsome. The progeny will possess both strength and action, which when combined form the "ne plus ultra" of all animal perfection that is meant for the purposes of exertion. Such an animal will wonderfully contrast the prizes of our agricultural shows; but of the side of superiority no doubt would for a moment remain. *D. J.*, 1849.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A MONTHLY COUNCIL was held at the Society's House in Hanover Square, on Wednesday last, the 1st of May. The following Members of Council and Governors were present: His Grace The Duke of RICHMOND, K.G., trustee, in the Chair; Lord Bridport, Lord Portman, Hon. R. H. Clive, M.P., Hon. Dudley Pelham, M.P., Hon. H. W. Wilson, Sir Thomas Dyke Acland, Bart., M.P., Sir Charles Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Mr. Alcock, M.P., Col. Austen, Mr. Raymond Barker, Mr. C. Barrett, Mr. S. Bennett, Mr. H. Blanshard, Mr. Bramston, M.P., Mr. Brandreth, Mr. Burke, Col. Challoner, Mr. Evelyn Denison, M.P., Mr. R. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Hamond, Mr. Fisher Hobbs, Mr. Hudson (Castleacre), Mr. Jonas, Rev. C. E. Keene, Mr. Lawes, Mr. W. Miles, M.P., Mr. Milward, Mr. Pendarves, M.P., Mr. Pusey, M.P., Prof. Sewell, Mr. Shaw (London), Mr. Shaw (Northampton), Mr. Villiers Shelley, Mr. Sillifant, Prof. Simonds, Mr. W. Simpson, Mr. Stansfield, M.P., Mr. H. S. Thompson, Mr. C. Hampden Turner, Mr. Turner (of Barton), Mr. G. Wilbraham, and Prof. Way.

The following new Members were elected:

Ticehurst, Frederick, Hastings, Sussex
Pedlar, Richard, Barton, Tiverton, Devon
Smith, Richard, Sedlescombe, Battle, Sussex
Northcote, Stafford H., Pynes, Exeter
Arnold, George, jun., Dolton, Crediton, Devon
Limbrick, George, Horton, Chipping-Sodbury, Gloucester
Corner, Richard, Torweston, Williton, Taunton
Watson, Richard Huxham, Dorsley, Totnes
Shorten, Charles Thomas, Ipswich, Suffolk
Barnes, Ralph, Exeter, Devonshire
Walker, William Henry, 38, Sackville-street, London
Kingdon, Samuel, Duryard Lodge, Exeter
Creed, John, Whiddon House, Newton-Abbots, Devon
Norris, Thomas George, Southernhay, Exeter
Lumley, Robert Wheatley, 9, Charles-street, Berkeley-square
Saunders, Philip, Rudge Farm, Morehead-Bishop, Crediton
Boscawen, Emlyn, Mereworth Castle, Tonbridge
Tout, Michael, Burrinton, Chumleigh, Devon
Horsfall, Thomas, Burley Hall, Otley, Yorkshire
Whidborne, J., Teignmouth, Devon.

FINANCES.—Colonel CHALLONER, chairman of the

Finance Committee, laid before the Council the Monthly Report on the accounts of the Society; from which it appeared, that, on the previous day, the current cash-balance in the hands of the Society's bankers was 2582*l.* (including 1260*l.* as the subscription from Exeter, 180*l.* on account of compositions for life, and 1142*l.* as special balance available for current purposes). The Report contained the following reference to legal proceedings, instituted, by special order of the Council, against those members of the Society who were more than two years in arrear of their subscription, and who have failed to comply with the claims of the Society, as communicated to them in the numerous circulars addressed to them, from time to time, on the subject.

"The Finance Committee have to report that, in conformity with the orders of the Council, they have, in the course of the past month, taken out summonses in the County Court against a portion of those persons residing in and about London, who have neglected to respond to any of the applications repeatedly made to them for the payment of their arrears; most of whom, on the receipt of their summons, have paid into court the amounts due to the Society, together with the costs. The Finance Committee cannot but regret that the painful necessity which obliges them to resort to these extreme measures, for the recovery of arrears due to the Society, should entail additional expense on the parties who thus contend its just claims in these cases, as well as in those, which may hereafter arise, in which parties, by order of the metropolitan courts, and agreeably with the power vested in them, may be required to be summoned from distant parts of the country to London, as the locality within which their obligations to the Society have been contracted, and become thereby subject to a still further amount of costs. —The Committee will continue to persevere steadily in carrying out the orders given to them by the Council for the recovery of the arrears still remaining due."

The Committee concluded their Report by recommending that Messrs. Saunders and Co., of Exeter, should be requested by the Council to accept the appointment of Bankers to the Society during the period of the Exeter meeting.

The Council having taken this Report into their deliberate consideration, decided, that, while the just claims of the Society should be fully maintained in these actions, and the various powers at the disposal of the Society made known to the parties resisting them, every care should be taken to prevent an increase of costs to the defendants, although cases might unfortunately occur in which it would be imperative on the Society to avail themselves of a special order of court for the summoning of a member from a remote part of the country to London, to answer in person the claims made against him, a necessity which, they trusted, would only seldom occur. They also expressed a hope, that when the Society had established, by a few decisive cases, its full claim for the recovery of arrears, the members in arrear, both for their own sake and that of the Society, would at once, without further appeal to legal forms, discharge the obligations into which they had voluntarily entered. It was also thought desirable that it should be known, that, in all cases where parties withheld their subscriptions because the Journals of the Society had not been transmitted to them, the Journals, on the payment of the subscriptions, would be immediately forwarded, and had been only withheld in accordance with a rule of the Society which required the subscription to precede the transmission of the Journal. The Report of the Finance Committee was then adopted and confirmed.

Prize Essays.—Lord Portman, in the absence of Mr. Pusey, reported the further awards made by judges of Essays for the current year, which, on the chairman's opening the sealed motto-papers of the Prize Essays, were as follows:

I. The Prize of 50*l.*, for the best Report on the Farming of Somersetshire, awarded to Thomas Dyke Acland, jun., of Holnicote, near Minehead.

II. The Prize of 20*l.*, for the best Essay on the Management of Oats, awarded to John Haxton, Farmer, of Drumnod, near Cupar, Fifeshire.—The Judges commended the essays bearing the mottoes, "Theory without Practice is nothing worth," and "Let Experience test the truth of Science."

III. The Prize of 5*l.*, for the best Essay on the Climate of the British Islands in its effect on cultivation, awarded to Nicholas Whitley, Surveyor, Truro, Cornwall.—The Judges commended the Essays bearing the mottoes, "Observation guided by Science," and "A. B. C."

Agricultural Chemistry.—Lord Portman also laid before the Council the Report of the Chemical Committee, including a special report made by Prof. Way on the operations carried on in his laboratory during the past year. The Council directed that this Report of Prof. Way should be read before the Members at the Weekly Council to be held on the following Wednesday; and they adopted the following proposed subjects of investigation during the ensuing year:

1. The continuation of the investigation into the absorptive properties of soils, including clays.
2. The nutritive properties of the Grasses.
3. The agricultural properties of the chalks and marls.
4. The chemical properties of water; with a view to its effect on irrigation, and on the health of animals.

Exeter Meeting.—Lord Portman then reported the favourable progress of the arrangements connected with the Exeter Meeting: the erection of the pavilion and show-yard, under the direction of Mr. Henry Manning, the Contractor of Works to the Society; the entries for implements and stock by exhibitors; the personal explanation of the theory and practice of catch-meadows in Devonshire, by Mr. George Turner, of Barton, and the exhibition of Sir Thomas Acland's water-meadows at Killerton; and the preparation of the programme of proceedings connected with the Exeter meeting, for the information of the members.—This Report was adopted by the Council.

Colonel Challoner having called the attention of the Council to the convenience and advantage of the Pavilion Dinner taking place on the Wednesday instead of the Thursday, as heretofore, it was carried, on the motion of Lord Portman, that, after the present year, the Pavilion Dinner should take place on that day. The Council referred the question of the place where the judges' awards of live stock were to be read at the Exeter meeting, to the consideration of the general Exeter Committee.

Mr. Fisher Hobbs and the Hon. H. W. Wilson having called the attention of the Council to the desirableness of an extension of time for the exhibition of implements and live stock at the country meetings of the Society, the noble Chairman suggested that such extensions should this year be tried at Exeter only as an experiment, in order that the Directors and Stewards might examine into the result of its effects on the animals exhibited, for the future guidance of the Council in repeating or discontinuing such extension. The Council then agreed that the show-yard should be open to the public on the Friday, at one shilling each person, from 6 o'clock in the morning till 12 at noon, after which time the cattle might be removed.

On the motion of the Hon. Capt. Pelham, seconded by Mr. Shelley, Mr. Anthony Hamond, of Westacre Hall, Norfolk, was appointed the Steward-Elect of Implements for the Exeter meeting, to come into office as a Steward in that department at the ensuing meeting of the Society, at which there would be an exhibition of implements, namely, in 1852.

On the motion of Mr. Brandreth Gibbs, Mr. Samuel Jonas, of Ickleton, Cambridgeshire, was appointed one of the Stewards of Cattle at the Country Meetings of the Society, in the place of Mr. Kinder, who retires by rotation.

The following committees were appointed for the selection and recommendation of the Council, of proper persons to be appointed as judges at the Exeter meeting, from nominations particularly requested to be made by the members at large of the Society, and communicated to the Secretary before the general meeting on the 22d inst., or to the President on that day; such members, in making these nominations, being requested to certify from their personal knowledge that the parties proposed are qualified and willing to act as Judges for the particular class for which they are respectively recommended, and who are unconnected with any exhibitor of stock or maker of implements, and have no direct personal interest in the stock exhibited, as the breeder of any of the animals upon which they may be called upon to adjudicate. 1. Committee for Judges of Implements: Lord Portman, Mr. Thompson, Col. Challoner, Capt. Pelham, M.P., Mr. Brandreth, Mr. Hamond, and Mr. Shaw, of London. 2. Committee for Judges of Cattle: Lord Portman, Col. Challoner, Mr. Shaw, of London, Mr. Miles, M.P., Mr. Shaw of Northampton, and Mr. Brandreth.

Meeting of 1851.—The Council, having had letters read to them from Mr. Pusey M.P., the Chairman of the Inspection Committee, appointed by the Council "to inspect any site or sites of ground proposed for the show-yard in 1851, and to report to the Council their suitableness or otherwise for the purposes of the Society," and received statements from the members of the Committee then present at the Council, unanimously agreed to the following resolutions:

1. That the Council are prepared to fulfil their promise of holding a Cattle Show in Hyde Park in 1851, as requested by the Royal Commission.
2. That the Inspection Committee be requested to communicate the above resolution to the Royal Commission.
3. That the General Meeting in the country required by the Charter, be held in 1851, at Hampton-court.

The Council then appointed the following General Middlesex Committee. Duke of Richmond, Marquis of Downshire, Lord Portman, Hon. Capt. Pelham, M.P., Mr. Raymond Barker, Mr. Brandreth, Col. Challoner, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Milward, Mr. Shaw of London, Mr. Miles, M.P., Mr. Shelley, and Mr. Pusey, M.P.

Veterinary Inspection.—Mr. Raymond Barker, Chairman of the Veterinary Committee, reported that an interesting statement had been received from Prof. Simonds, detailing his inquiries into the cause of the great amount of illness and death in cattle on farms in Somersetshire, occupied by tenants of Lord Portman. The circumstantial evidence derived from the locality in which the cattle were placed, and the post-mortem examination which Prof. Simonds had made on one of the animals placed at his disposal, appeared to fix the cause of the malady on the water the animals had been in the habit of drinking. Specimens of the water were undergoing the chemical examination of Prof. Way, and Prof. Simonds was prosecuting his researches into the physiological changes of condition and structure found to have taken place in the diseased cattle. Mr. Barker hoped that the final report would be received by the committee, and laid before the Council at their Monthly Meeting in June next.

The Council then agreed to the House List of Council, to be recommended at the ensuing general meeting, agreeably with the terms of the Bye-laws; and having decided that such general meeting should be held at 11 o'clock in the forenoon of Wednesday, the 22d inst., they adjourned to their weekly meeting on Wednesday next.

Prof. Way has signified his regret that he will be under the necessity of postponing his lecture "On Variations in the Chemical Composition of Water, as affecting its Agricultural uses," from the 15th of May to the 19th of June, in consequence of his inability to complete the details of that lecture, from the more immediate pressure of other engagements for the Society, which at present entirely occupy his time.

Farmers' Clubs.

York: At a late monthly meeting of this Club Mr. Hawking, of Linton-upon-Ouse, delivered a lecture on the subject of *Agriculture and its Prospects in Connection with the past.* He said:

If we regard farming operations, we find them nearly as expensive as they were when produce was selling at much higher prices, except 10 per cent. deducted on wages. Now to simplify and illustrate, I will make a comparison between the present year and the 12 past years, which make an average price of Wheat about 7*s.* per bushel, Barley 34*s.* per qr., and mutton 6*d.* per pound. Take 100 acres of arable land upon the four-course system, at 25*s.* per acre rent, 125*l.*, which should produce annually, viz.:

25 acres of Wheat, 24 bushels per acre, at 7*s.* p. bush.	£210	0	0
25 acres of Barley, 36 bushels ditto, at 34*s.* per qr. ...	191	5	0
50 fat sheep, 24 lbs. per qr., 6*d.* per lb., 48*s.* each ...	120	0	0
Wool on 90 sheep, 450 lbs., at 1*s.* per lb.	22	10	0
Total	£543	15	0

The total produce of the farm ought to raise 543*l.* 15*s.*, which is nearly four and a half rents, and ought to be produced upon a well cultivated farm. Then take the same farm, at the same rent and produce, at present prices:

25 acres of Wheat, 24 bushels per acre, at 5*s.* per bushel	£150	0	0
25 acres of Barley, 36 bushels ditto, at 25*s.* per qr. ...	140	12	6
50 fat sheep, 24 lbs. per quarter, at 5*s.* per stone ...	100	0	0
450 lbs. of wool, at 10*d.* per lb.	18	15	0
Total	£409	7	6

Which would be the total produce of the farm, only making three rents and a fraction short of a half; in fact, making a difference between present prices and the past of 134*l.* 7*s.* 6*d.* in the cultivation of 100 acres of land, having a rent charge of 125*l.* Thus showing if the rent is forgiven, the cultivator will still sustain a loss, and at present he has received no deduction, except about 10 per cent. on wages. Now, let us prove what amount of labour will be required to cultivate this farm:

For three men, at 12*s.* per week each...	£93	12	0
For three boys annually, at 8*s.* per week	62	8	0
Total	£156	0	0

Ten per cent. upon 156*l.* would be 15*l.* 12*s.*, which deduct, and it still leaves the farm minus 118*l.* 15*s.* 6*d.*, without paying one farthing rent for his land. This shows to us at once that farming has been a most excellent business, or is now a most ruinous one. And if we remark upon the old farmers, with all their sobriety, diligence, and economy, not many of them got rich, nay, very few of them could be gratified like the common industrious tradesmen in towns, who attend to business 20 or 30 years, then enjoying themselves in retirement on the fruits of their early labours. Some people say you must adopt scientific farming, and many of these would-be instructors, if you test them, do not correctly know the right end of a plough. To farm in a scientific manner, the landlords must make greater investments, to encourage the scientific cultivator in his enterprise. And the cultivator himself must sink more capital before he can bring his plan into operation. But I may at present ask what landlord and what tenant can be induced to sink more capital, when that which is already sunk returns them so little interest, and with every prospect of paying them less. I am not going, sir, to discourage scientific farming, for I admire, I learn, and I practise it, so far as I am persuaded it will yield a return. It is our interest, as agriculturists, to keep our farms in a good state of cultivation, and to produce good crops at as little expence as we can. And it is the duty of agents to respect, to encourage, to shield, and to prefer good farmers to bad, for before a man can raise a farm to a good state of cultivation, he must sink 7*l.* of his own money upon every acre he occupies, thereby making every 100 acres he occupies 700*l.* more valuable than that which is occupied by a bad farmer. But before a man can be induced to sink so much of his capital in the cultivation of rented land, he must have confidence in the owner and agent, for he cannot act like the tradesman—put his money into goods and take it out when he likes. For in many instances what the cultivator expends in the cultivation of his soil, he does not expect, nor can he get it back again in less than three or four years. It is generally said lower your rents, which must be done; yet, I have shown that the taking away of the whole rent will not be equivalent to an advance of 1*s.* 6*d.* per bushel upon the Wheat crop, making it 6*s.* 6*d.* per bushel instead of the present price, 5*s.* If there is to be no rent paid upon landed property, it will be of no use to the owner, and will be destructive to the real national funds of this country, for past instances show that we have no real security unless it is invested in the soil. We must not only have a reduction in rents, but in all taxations, rates, wages, tradesmen's and merchant's accounts, destroying sinecures, pensions, and all superfluous salaries, lowering centage and profits upon trade in ratio to the landed interest. Would it not be fraudulently unjust to take away the interest of the landed proprietor, and leave the other interests of the country undiminished? In the national weal all interests must rise or fall together. It is estimated that in the United Kingdom there are 48,000,000 acres of land under cultivation, at a rental of 40,000,000*l.* per annum; and that 22,000,000 are cultivated for the grain crop, which may be calculated to produce the following quantities at the late expected prices:

24,000,000 qrs. of Wheat, at 56*s.* per qr. ...	... £67,000,000
10,000,000 qrs. of Barley, at 36*s.* per qr. ...	... 18,000,000
40,000,000 qrs. of Oats, at 28*s.* per qr. ...	... 56,000,000
5,000,000 qrs. of Beans and Peas, at 40*s.* per qr.	10,000,000
Total	£151,000,000

Now let us take the national production at the present prices.

Wheat at 40*s.* per qr.	... £48,000,000
Barley at 25*s.* per qr.	... 12,500,000
Oats at 16*s.* per qr.	... 32,000,000
Beans and Peas, at 30*s.* per qr.	... 7,500,000
Total	£100,000,000

Thus you see to a demonstration that the produce of the arable land of this country is depreciated in value one-third, consequently the value of land is reduced one-third, and that one-third of the money invested in land and its improvement, and the stock and crop upon it, is taken away and lost to its rightful owner. Therefore, unless the land occupier can have his rent reduced one-third, and all rates and taxes, and wages and expenses upon his land reduced one-third, it is impossible for him to pay his way under existing depression.

Review.

On the Drainage of Strong Clays. A Prize Essay of the Newcastle-upon-Tyne Farmers' Club, by Peter Laws.

We have great pleasure in directing attention to this little work, as highly creditable to the Newcastle Club; which (as we have not lately seen any papers by its members), we had begun to fear was defunct. Mr. Laws had adopted throughout a medium, and we think a judicious, line between the deep and shallow drainers, and between the pencil-cases and the tunnels. He has also illustrated the work with some very neat drawings

to which we would suggest, in case of a reprint, more extensive reference or description than he has at present given. The strong clays on which the Essay treats are subdivided into—1st, Tenacious clays, on which he recommends the drains to be 16 feet apart and 28 inches deep; 2d, Strong stony clays, on which the drains should be 20 feet apart and 3 feet deep; 3d, Friable clays, the drains to be 24 feet apart and 3 feet deep; 4th, Soft free loamy clays, the drains to be 30 feet apart and 3 feet 6 inches deep; 5th, A mixture of the above clays, interspersed with gravel and sand, the drains to be 26 feet apart and 39 inches deep. We refer to the work itself for the estimates of the expense at which the above work can be done in Northumberland, and also for several other useful tables. In some of the above clays Mr. Laws advocates the filling in of the drains with the surface soil, but in 3 and 4 he thinks it immaterial whether this be used for that purpose or the clay that has been taken out. Upon the tenacious clays he expresses a most decided opinion that increased depth will not compensate for excessive distance, and if the drains be filled in with the clay taken out "he is satisfied that the latter will return to its original state." Mr. Laws has in general advocated the use of pipes, though he says that in strohg clays the common horse-shoe tile draws quicker. No reason is assigned for this last opinion. If the various distances which are recommended to be used in the above-named description of soils be anything like correct, they afford an odd commentary upon those who would lay down one rule for depth and distance in all situations. *C.*

Miscellaneous.

Improved Churn.—Mr. B. Samuelson, of the Britannia Iron-works, exhibited a newly invented churn at our market, on Thursday last, with which he produced upwards of 3 lbs. of excellent butter in the short space of 8 minutes on the first and 7 minutes on the second trial. The churn is made entirely of wood, and is similar in appearance to the ordinary box churn—differing from it only in the construction of the dasher, which is hollow and divided by a horizontal and several vertical partitions, into a number of cells; these as the dasher revolves carry the air down with them, and by its mechanical action on the cream, cause the butter to be obtained in the short time we have recorded. *Banbury Guardian.*

Conduct of an Irish Landlord.—I cannot forbear mentioning the noble conduct of Mr. Stephen De Vere as related to me by Lord Monteagle. A large body of the tenants of Sir Aubrey De Vere, foreseeing the calamity likely to fall on them from the effects of the famine, resolved to emigrate to North America. To guard them against the wretched treatment to which they were then exposed on the voyage, this young gentleman accompanied his father's tenants, taking a steerage berth, and sharing in their privations. The fever broke out on board; he tended the sick, and caught the fever himself, from which, after being in great danger, he fortunately recovered. After landing the people, he accompanied them up the country, remained with them till they were fairly set a-going, and then returned home. *The Plantation Scheme, by Mr. Caird.*

Irish Labour and its Reward.—The employers of labour generally, in the west of Ireland, are not overburdened with ready money. They do not pay their labourers with regularity, and accordingly the people become disheartened, and their labour is then indolently and very grudgingly given. I am assured by a gentleman who occasionally had under his direction the employment of several hundred men, that he at first found great unwillingness on their part to task work; but after some trial with them, they became very fond of it. And what was the reason? Their former employers had given them task-work; but at the end of the week, finding that the people were earning more than the usual rate of wages, they lowered the contracts, and thus discouraged the system altogether. As soon as the men found that the rate for their work was lowered in proportion as they the more exerted themselves, they naturally became disgusted with task-work. But this gentleman continued the same rate throughout; and the men, finding that they were not taken advantage of, worked willingly, aud made good wages. *The Plantation Scheme, by Mr. Caird.*

Notices to Correspondents.

Ammoniacal Liquor: *Irish Sub.* The only ammoniacal liquor with which the farmer in a general way has to do, is the urine of his cattle. In some rare cases gas water, which is an ammoniacal liquor of variable strength, is to be had. It should be used in compost with some absorbent material, as vegetable matter of any kind, sawdust, spent bark, or peat, which it will cause to rot. Carbonate of ammonia is too costly to purchase, and it is volatile; the sulphate of ammonia is a better salt. But guano is, taking all points together, probably the cheapest manure in the market.

Cement: *J D.* If the tank be built of brick laid in blue lias cement, it will hold water. And probably any leakage may be cured by rebuilding the faulty part, using this mortar, and puddling with clay behind the wall.

Charcoal: *W Everitt.* It is very useful in compost. Mix it with guano, at the rate of 8 or 10 bushels to a cwt. You cannot compare the two, for their qualities depend upon altogether different circumstances.

Churn: *B B B, &c.* The American churn was fully described at page 269. Weston's air churn, introduced at Liverpool, we have never been able to find; it is believed that the agitation of the cream by it was effected solely by the passage of air through it. In the American churn the agitation is produced in the usual way by a dasher, but this is constructed so as to carry air down with it.

Dogs: *S.* You should apply to your solicitor on the subject. The injustice no doubt admits of legal remedy.

Ducks: *F G S.* The Aylesbury breed, and the Warwickshire blues, are good sorts; 12 lbs. a pair are a good weight for young ducks. You will not make much by fattening ducks on bought food.

Grass Seeds: *G A.* Now; apply to Mr. Dickinson, we believe at 7, Curzon-street, May-fair.

Grass Lands: *Somerset Farmer.* You may consider that there is much manure in the ashes now that they are saturated with liquid manure. The proposed dressing of Mangold Wurzel seems ample. Peat ashes vary exceedingly in quality. They often contain a good deal of gypsum. The best use you could make of peat would be to char it and use it in compost with liquid and other manure. You would soon find the value of that.

Machines: *A Subscriber.* Messrs. Barrett and Exall, of Reading, make a very light plough, which we should suppose to be under the command of one horse. Occupants of 3 or 4 acres should dibble all the Turnip or Mangold Wurzel seeds they will use, by hand. It will not answer their purpose to try the dibbling machines in use for these purposes.

Manure: *B T.* The cow is said to yold 13,000 lbs. weight of urine per annum. We do not know what may be the weight in the case of the pig—probably not above 1100 or 1200 lbs.

Permanent Pasture on Stiff Soil: *Yardley.* Aira cæspitosa lutescens, Tufted Hair Grass, 1 lb.; Alopecurus pratensis, Meadow Foxtail, 3 lbs.; Arrhenatherum avenaceum, Tall Oat-like Grass, 2 lbs.; Dactylis glomerata, Rough Cock's-foot, 3 lbs.; Festuca duriuscula, Hard Fescue Grass, 2 lbs; F. heterophylla, various leaved, 2 lbs.; F. elatior, tall, 2 lbs.; F. loliacea, spiked, 3 lbs.; F. pratensis, meadow, 2 lbs.; Lolium italicum, Italian Rye-grass, 3 lbs.; L. perenne, common Rye-grass, 5 lbs.; Phleum pratense, Meadow Cat's-tail, 2½ lbs.; Poa nemoralis, Wood Meadow Grass, 3 lbs.; P. trivialis, Rough-stalked Meadow Grass, 2½ lbs.; Trifolium pratense, common Red Clover, 4 lbs.; T. repens, White Clover, 5 lbs. Total, 45 lbs., and 1 bushel of Barley per acre.

Poultry: *W R.* Mr. Bailey, Mount-street, Grosvenor-square.

Rural Chemistry, by E. Solly, price *4s. 6d.*, second edition revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

Soap Ashes: *G Lee.* They would be likely to destroy the seeds mixed with them, unless the ashes were very old, and had been long exposed to the air. The best way of applying soaper's ashes is to throw them broadcast, at the rate of 2 or 3 tons per acre, over clay land stubble in autumn, a month before ploughing them in.

South Hampshire: *A B* would be much obliged to the reporter of the "South Hampshire Farm," if he would state from his experience how many weeks it takes in winter for a Dorset ewe to bring her lamb to 10 lbs. a quarter, and what quantity of corn and cake per week is necessary (in addition, of course, to Swedes and hay-chaff *ad libitum*) for this, and to make herself fat at the same time.

Turnips, &c.: *A B.* We have sown seed nearly above superphosphate in the same way, but it is well to have a layer of earth between the two.—If your haulm remained healthy, it would probably have resulted in a larger crop of tubers; but an excessive luxuriance of leaf is not at present a desirable character in the Potato crop.

Water-ram: *B.* We have one of Mr. Roe's machines at work in our neighbourhood. It answers its purpose perfectly, which is to raise water about 80 feet by means of a fall of 6 or 8 feet.

Markets.

COVENT GARDEN, May 4.

Vegetables are well supplied, but most kinds of winter Fruit are over. Strawberries and Hothouse Grapes are both more plentiful, and the same may be said of Pine-apples, of which some good fruit may be obtained. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. A few bunches of young Carrots and Turnips may be had at from 1s. to 2s. per bunch; and some green Peas have made their appearance from Cornwall. Frame Potatoes fetch from 1s. to 3s. per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, Seakale, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Camellias, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Almonds, per peck, 6s
Grapes, hothouse, p. lb., 8s to 12s	— sweet, per lb., 2s to 3s
— Portugal, p. lb., 9d to 1s	Walnuts, p. 100, 1s 6d to 2s
Strawberries, per oz., 4d to 1s	— p. bush., 16s to 24s
Apples, kitchen, p. bsh., 4s to 6s	Nuts, Barcelona, per bush., 20s to 22s
— per 100, 6s to 12s	— Brazil, p. bsh., 12s to 16s
Oranges, per doz., 9d to 1s 6d	Kent Cobs, 90s to 100s p. 100 lbs
— per 100, 5s to 12s	
Lemons, per doz., 1s to 2s	

VEGETABLES.

French Beans, p. 100, 1s to 2s 6d	Onions, p. bushel, 3s 6d to 4s 6d
Seakale, per punnet, 1s to 2s	— Spanish, p. doz., 1s 6d to 4s
Asparagus, p. bund., 2s to 5s	Shallots, per lb., 4d to 8d
Rhubarb, p. bundle, 6d to 1s	Garlic, per lb., 4d to 8d
Cabbages, per doz., 6d to 1s	Lettuce, Cab., p. sc., 4d to 9d
Cauliflowers, p. doz., 1s to 4s	Endive, per score, 1s 6d to 3s
Broccoli, p. doz. bundl., 8s to 10s	Mushrooms, p. pot., 9d to 1s
Greens, per doz., 3s to 4s	Small Salads, per punnet, 2d to 3d
Sorrel, p. hf. sieve, 1s to 1s 6d	Fennel, per bunch, 2d to 3d
Potatoes, per ton, 60s to 120s	Savory, per bunch, 2d to 3d
— per cwt., 3s to 7s	Thyme, per bunch, 2d to 3d
— per bush., 2s 6d to 3s 6d	Parsley, p. doz. bun., 2s to 3s
— frame, per lb., 1s to 3s	— Roots, p. bdle., 9d to 1s
Turnips, p. doz. bun., 1s 6d to 2s 6d	Marjoram, per bunch, 2d
Red Beet, per doz., 9d to 1s	Mint, green, per bunch, 3d & 4d
Cucumbers, each, 6d to 2s	Watercress, p. doz. bunches, 6d to 9d
Leeks, per bunch, 1d to 1½d	Horse Radish, p. bdl., 1s to 4s
Celery, p. bundle, 8d to 1s 6d	
Carrots, per bun., 4d to 6d	
Spinach p. sieve, 1s	

POTATOES.—Southwark, April 29.

The Committee report that there has been a liberal supply, during the past week, both coastwise and Continental, which, with a dull trade, has tended to depreciate prices with all second-rate sorts. The following are this day's quotations:—York Regents, 90s. to 120s. per ton; Scotch do., 60s. to 90s.; Scotch cups, 60s. to 70s.; whites, 40s. to 50s.; French whites, 40s. to 65s.; Belgian do., 40s. to 50s.; Dutch, 30s. to 40s.

HAY.—Per Load of 36 Trusses.

Smithfield, May 2.

Prime Meadow Hay	66s	to 72s	Clover	60s	to 84s
Inferior ditto... ...	50	63	New Clover	—	—
Rowen	—	—	Straw	23	27
New Hay	—	—		J. Cooper.	

Cumberland Market, May 2.

Prime Meadow Hay	70s	to 74s	Inferior	65s	to 72s
Inferior ditto... ...	50	65	New Clover	—	—
New Hay	—	—	Straw	24	30
Old Clover	78	84		Joshua Baker.	

Whitechapel, May 2.

Fine Old Hay ...	65s	to 68s	New Clover	—s	to —
Inferior ditto ...	50	55	Inferior ditto... ...	60	65
New Hay	—	—	Straw	22	25
Old Clover	75	80			

HOPS.—Friday, May 3.

Messrs. Pattenden and Smith report that the market continues the same as for some time past. The bine in many places continues in a weak state.

SMITHFIELD, Monday, April 29.

We have to-day an unusually large supply of Beasts. Prices are lower, and several remain unsold. A choice Scot barely reaches 3s. 4d., and the first-rate Short-horns make scarcely anything over 3s. The number of Sheep is also large, although not excessive; the demand is very limited, and late quotations cannot be supported. Lamb is a dull trade, at about Friday's prices. We are not overdone with Calves, but trade is no better. From Holland and Germany there are 314 Beasts, 2980 Sheep, and 85 Calves; from Scotland, 500 Beasts; and 3000 from Norfolk and Suffolk.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	0 to 3		2
Best Short-horns	2	10 — 3		0
2d quality Beasts	2	4 — 2		8
Best Downs and Half-breds ...	4	2 — 4		4
Ditto Shorn ...	3	8 — 3		10

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools .	3	8 to 3		10
Ditto Shorn ...	3	4 — 3		6
Ewes & 2d quality	3	4 — 3		8
Ditto Shorn ...	2	8 — 3		2
Lambs	5	0 — 5		8
Calves	2	8 — 4		0
Pigs	3	0 — 4		0

Beasts, 4448; Sheep and Lambs, 23,220; Calves, 165; Pigs, 225.

Friday, May 3.

The number of Beasts is not so large as might have been expected, considering that many remained over from Monday. Trade is exceedingly dull, and although a few choice Scots make 3s. 4d., it is too much to quote as average for the best qualities. Sheep and Lambs are plentiful; for the former, prices remain the same as on Monday, with more difficulty in obtaining them; the latter meet with a dull sale, at rather lower rates. The number of Calves is large, but the average quality is inferior; consequently a choice one makes 4s.; this is, however, an extreme quotation. From Germany and Holland there are 70 Beasts, 240 Sheep, and 217 Calves; from Scotland, 240 Beasts; from Norfolk and Suffolk, 300; and 132 Milch Cows from the home counties.

MARK LANE.

Monday, April 29.—The supply of Wheat from Essex, Kent, and Suffolk this morning was short, and sold at an advance of 1s. per qr. upon the prices of this day se'nnight. Foreign met an improved inquiry, and fine heavy qualities of red also commanded an improvement of 1s. per qr.—English Barley is unaltered in value, but foreign is inquired after at rather more money.—We raise our quotations 1s. per qr. for Mazagan and Egyptian Beans.—Peas are firm.—Oats meet a better demand, and have nearly recovered the depression of last week.

Friday, May 3.—The arrivals of English corn this week have been small, but we are largely supplied from abroad with Wheat, Barley, and Oats. This morning's market was attended by several buyers from a distance, some of whom appeared disposed to purchase on speculation, but the advanced rates insisted upon restricted business. In the sales effected in foreign Wheat an improvement of 1s. per qr. was generally realised.—Our quotations of Barley, Beans, and Peas are fully supported.—Oats are in lively demand at former prices, but a rise of 6d. per qr. renders them difficult of disposal.—We quote good common brands of French Flour 28s. to 29s., extra 31s. to 32s. per sack of 280 lbs., and there is a good sale.

Liverpool, Friday, May 3.—Since Monday last the arrivals of Irish grain into this port have entirely fallen off, but from the north of Europe we have a fair supply of Wheat, and a moderate quantity of Barley and Beans. Our market this morning opened with a tolerably firm aspect, and Wheat continuing to meet a fair demand, the current prices of Tuesday were fully maintained, and in some instances advanced 1d. per 70 lbs. Barley and Beans claiming more attention, improved 6d. to 1s. per qr., and Malt was 1s. per qr. dearer. Oats, realised a further advance of ¼d. per 45 lbs., and Oatmeal was the turn dearer. American Flour advanced 6d. per barrel.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition, by Auction, at the Mart, Bartholomew-lane, on THURSDAY, May 9th, a first-rate collection of Dahlias; the newest varieties of Fuchsias and Verbenas; also Geraniums, Heartsease, and other plants in bloom.—May be viewed the morning of Sale; and Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, one mile from Hyde-park Corner, on TUESDAY, May 7th, at 12 o'clock, a Choice Assortment of Carnations, Pinks, Picotees, Dahlias, Pansies, and Herbaceous Plants; a quantity of Bedding Plants Geraniums, &c., in bloom. May be viewed on the morning of Sale, and Catalogues had of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, Middlesex.

TO BE LET, IN ESSEX, with immediate possession, a FARM of 200 acres, principally arable, within 20 miles of town, and five of a railway station. Apply to Mr. W. SOUNDY, Park Farm, Henley-on-Thames.

SEATON, COAST OF DEVON.

TO BE LET, unfurnished, with immediate possession, by the year, or for a term, the MANOR HOUSE, containing spacious Dining and Drawing-rooms, 10 Bed-rooms, Kitchens, and other offices, with Coach-house, Stables, and Garden; also the right of Shooting over about 700 acres of preserved land. Situated between Lyme and Sidmouth, on a picturesque and healthy part of the south coast of Devon.—To view, apply to Mr. JAMES MAJOR, Seaton; and for further particulars to Mr. BABBAGE, Nettlecomb, near Taunton; or to Mr. JOHN HARE, House-agent, Taunton.

HORTICULTURAL TOOLS.

GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Shears, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. HARTLEY and Co., precisely at their prices. Cut to order in panes of

21 oz. ,, 3½*d.* 5*d.* ,, ,, ,,
26 oz. ,, 3½*d.* 7½*d.* ,, ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. CHANCE, HARTLEY, SWINBURNE, and others.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO (GENUINE) in packages, 1*s.* each, sufficient to make 50 gallons; Cuba BAST, 1*s.* per lb.; Six-inch garden wood TALLIES, prepared for the pencil, 1*s.* per 100. The above may be had, together with every kind of Flower and Vegetable SEEDS, upon application to WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, near the Spread Eagle, London.

TO FARMERS AND MARKET GARDENERS.—MANURE.

MESSRS. RICHARDSON, CURRIE, AND Co.'s BONE AND CHEMICAL MANURES, Newcastle-upon-Tyne, have been successfully used for the last four years, by the agriculturists of Northumberland, Berwickshire, the Lothians, and other districts of the Kingdom; the attention of Farmers and Gardeners is particularly directed to their superior quality and true fertilising nature, and which are suited for every description of crops. For the present season they recommend their Manure for

Turnips and Bulbous Roots, at	...	£8 0 0	per ton.
Superphosphate of Lime, at	...	7 0 0	,,
Superior British Guano, at	...	6 10 0	,,

Delivered free in the Thames or nearest stream.

W. J. WILKINSON, 12, Little Tower-street, London, agent for London and the south of England.

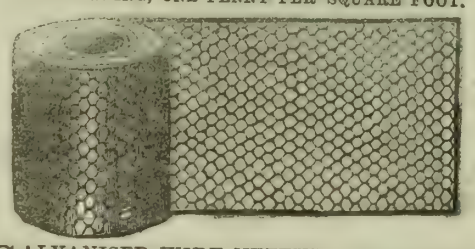
CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, May 4.



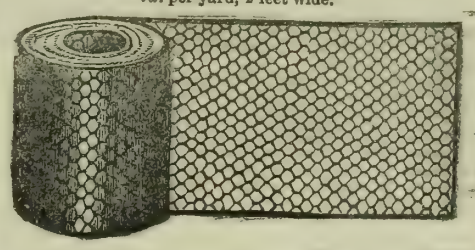
NETTING, FLAGS, AND BUNTING.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.*	per yard		30 inches wide	7½*d.*	per yard	
18 ,, ,,	4½*d.*	,,		36 ,, ,,	9*d.*	,,	
14 ,, ,,	6*d.*	,,		48 ,, ,,	1*s.*	,,	

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

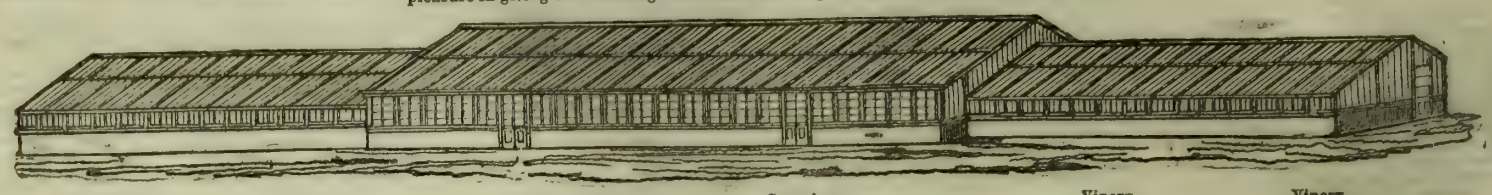
		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B, Oxford-street, London."

GREY GOOSE FEATHERS, 1*s.* per lb.—HEAL AND SONS' present prices for Bed Feathers are:—



Poultry	0*s.* 8*d.*	Best Grey Goose	1*s.* 10*d.*
Grey Goose	1 0	White ditto	2 2
Foreign ditto	1 6	Best Dantzic ditto	3 0

Purified by steam, and warranted sweet and free from dust.—HEAL and SONS' List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post, on application to their Factory, 196, Tottenham-court-road, London.

GRAY, ORMSON, AND BROWN,

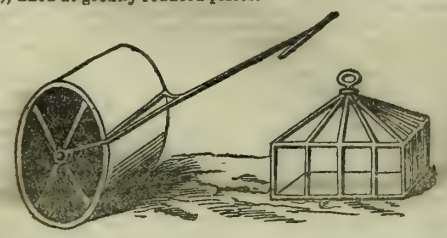
DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.

Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3	15 0
Do. of 100 yards, 24 ins. wide	.. ..	5	0 0
Do. of 100 yards, 30 ins. wide	.. ..	6	5 0
Do. of 100 yards, 36 ins. wide	.. ..	7	10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

ALLSOPP'S BURTON AND EAST INDIA PALE ALES.—Messrs. S. ALLSOPP and SONS beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS, is strongly recommended for softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

PERSONS AFFLICTED WITH SCURVY, SCORBUTIC HUMOURS, OR DISEASES OF THE SKIN, SHOULD USE HOLLOWAY'S OINTMENT AND PILLS.—Scurvy, Ringworm, and other cutaneous disorders, are engendered by the impurity of the blood, and the only sure means to eradicate such complaints is to undergo a course of Holloway's Pills, and at the same time, apply externally his invaluable Ointment. Cures performed by these wonderful medicines are daily attested, proving their astonishing efficacy in purifying the blood, strengthening the constitution, and re-establishing health. They are equally certain in the cure of cancerous sores, ulcerated wounds, and glandular swellings; and persons so afflicted, should have recourse to these excellent medicines.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

"FAMILIAR IN THEIR MOUTHS AS HOUSEHOLD WORDS."
Shakespeare.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

The First Meeting will take place on SATURDAY, the 18th of May. Subjects for Exhibition must be at this Office on Friday the 17th, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition.

The Gates will be open to visitors at One, P.M. Tickets are issued at this Office, price 5*s.* each, or at the Garden in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each; but only to orders from Fellows of the Society.

N.B. No Tickets will be issued in Regent-street on the day of Exhibition. 21, Regent-street.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

GENERAL EXHIBITIONS of FLOWERS AND FRUIT on WEDNESDAYS, JUNE 12th and JULY 3d. AMERICAN PLANTS on SATURDAYS, MAY 25th and JUNE 1st.

Tickets to be obtained at the Gardens only, by orders from Fellows of the Society, price 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each. Each ticket will admit one person on any one of the above-named four days, or to the Collection of American Plants on any one day from the 3d to the 8th of June, both included.

The first PROMENADE will take place on Wednesday, May 15.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, under the patronage of her Most Gracious Majesty the QUEEN.

The SECOND EXHIBITION of the season will be held at the Royal Surrey Zoological Gardens, on WEDNESDAY, MAY 22d (open to all exhibitors), when Prizes will be awarded for the following productions, viz., for Miscellaneous, Orchids, and Specimen Plants; Pelargoniums, Cape Heaths, Azaleas, Tulips, Heartsease, and Vegetables. In addition to the prizes offered by the Society, Mr. R. J. Lawrence, of Hampton, offers 5*l.* value of Tulips, selected from his bed when in bloom, for the 1st and 2d Prizes to Amateurs. The following Exhibitions will also take place at the Royal Surrey Zoological Gardens, on Wednesday, June 19th; Tuesday, July 23d; and Wednesday, September 4th. Lists of Prizes, and the Rules for Exhibition, may be obtained from JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

VERBENA—"MELINDRES ALBA."

G. H. BUNNEY, NURSERYMAN, Stratford, Essex, has plants of the above splendid VERBENA to send out on the 23d inst., price 2*s.* 6*d.* each or 24*s.* per doz. The usual allowance to the Trade.

The above Verbena is of dwarf compact habit, and a very profuse bloomer, making it one of the very best white Verbenas for small beds, or single plants in the flower borders.

ACHIMENES TUGWELLIANA.—This beautiful

Achimenes was raised by Mr. Carmichael, gardener to G. C. Tugwell, Esq., Crowe Hall, Bath. It was the admiration of all who saw it in bloom, and the following opinions were expressed upon its merits:

"ACHIMENES: *W. C.* Your hybrid between A. patens and A. longiflora, with deep violet-purple flowers, about the size of those of A. patens, is a decided cross, and is a very beautiful thing, nice in colour."—*Gardeners' Chronicle*, August 11, 1849.

"ACHIMENES: *William Carmichael.* Your hybrid between A. patens and A. longiflora is distinct from both the flowers, being about the size of A. longiflora, with a colour intermediate betwixt the parents. It is undoubtedly a desirable acquisition to this already useful and ornamental class of plants."—Gardeners' Journal, August 18, 1849.

R. GLENDINNING possessing the whole stock of the above desirable Achimenes, will be prepared to send out good plants the first week in June, at 7*s.* 6*d.* each. For every three ordered one extra will be added.—Chiswick Nursery, near London.

STAINES HORTICULTURAL EXHIBITION, to be held on SATURDEY, JUNE 22. Open to all competitors.

A Prize of Five Pounds will be given for the best collection of 10 distinct species of Stove or Greenhouse Plants, which will not contain more than two of the same genus, excluding Pelargoniums, Fuchsias, and Calceolarias. A Second Prize of 2*l.* 10*s.* will also be given.

A Prize of Four Pounds will be given for the best collection of 6 Pelargoniums, varieties, in No. 12-sized pots. A Second and Third Prize will also be given.

A Prize of Three Pounds will be given for the best collection of 6 Pelargoniums, varieties, in No. 24-sized pots, A Second and Third Prize will also be given.

Six Exotic Orchids, varieties, 1 Prize. Collection of British Ferns, ditto. Collection of British Plants and Grasses, ditto.

The Judges will not be bound to award a Prize if they deem the production unworthy of it. No article sent for competition will be allowed to be touched or removed till 6 o'clock.

*** Great difficulty having hitherto existed in making arrangements for the Show, exhibitors are earnestly requested to forward to the Secretaries, at least three days previous to exhibition, a list of the articles they intend to produce.

CHARLES WALLIS, WILLIAM WATKINS, } Hon. Secretaries.

ROBERT GLENDINNING, Chiswick Nursery, near London.

RENDLE'S PRICED CATALOGUE OF PLANTS is JUST PUBLISHED, and can be had for one postage stamp.

Ever since our invention of the "Tank System of Heating Horticultural Buildings" (for which a Gold Medal was unanimously awarded to us by the Royal Devon and Cornwall Horticultural Society) we have been enabled to propagate plants in such abundance, with scarcely a failure, that we are enabled to offer them at

VERY REDUCED PRICES.

We shall have at least THREE THOUSAND DAHLIAS and FUCHSIAS ready for delivery after the 10th of May next, as well as a large quantity of Geraniums, Camellias, Indian Azaleas, Cinerarias, Verbenas, Antirrhinums, Chrysanthemums, with a large collection of Greenhouse, Hothouse, and Herbaceous plants, prices of which will be found in our new Catalogue, on application to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

ESTABLISHED 1786.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage.

This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

WM. JAS. EPPS begs to offer the following Plants, which are well established, and in fine health.

Having an extensive stock, he is enabled to offer them at the following reduced prices:

GERANIUMS, best vars. of last season, in 4-in. pots	36*s.*	per doz.	
Do., excellent varieties	... ...	12*s.* to 21*s.*	„
AZALEAS, all the new varieties	... ...	12*s.* to 21*s.*	„
ERICAS, do. do.	... ...	12*s.* to 24*s.*	„
STOVE and GREENHOUSE PLANTS,	...	12*s.* to 24*s.*	„
DAHLIAS, do. do.	... ...	6*s.* to 18*s.*	„
PANSIES, do. do.	... ...	6*s.* to 18*s.*	„
VERBENAS, all the best of last season	...	8*s.* to 12*s.*	„
Do., fine varieties	... ...	4*s.* to 6*s.*	„

Descriptive Catalogues of the above may be had on application. A large quantity of specimen Stove and Greenhouse Plants, Ericas, Heaths, Azaleas, &c., of all sizes. A remittance expected from unknown correspondents.

Bower Nurseries, Maidstone, Kent, May 11.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, are now sending out young plants, strong and healthy, of all the best varieties of CHRYSANTHEMUMS for autumn flowering, at 9*s.* and 12*s.* per dozen; the newest sorts at 18*s.* per dozen; and good free flowering sorts for planting in the open borders, 50*s.* per 100.

The Plants are in small pots, and in good order for packing. A Descriptive List may be had on application.

It is requested a Post-office order may accompany all orders from unknown correspondents.

NEW DARK FUCHSIA—"SIR J. FALSTAFF," 10*s.* 6*d.* per plant, one over when two are ordered.

Strong plants of the above on application to C. TURNER, Royal Nursery, Slough, Bucks.

NEW BLUE VERBENA, with white centre, of the finest shape and habit; equally adapted for bedding or pot culture, warranted much the best of its class.

C. TURNER has some strong plants left of the above at 5*s.* each, one plant over for every two ordered.—Royal Nursery, Slough, Bucks.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Those in bloom will be exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong blooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

READING NURSERIES, Portland-place, London-road, and at the back of the Seed Shop, Nos. 7 and 8, Market-place, Reading, Berks.—The additional Greenhouses and Hot-water Pits, recently erected adjacent to the Market-place, contain the most extensive and choice collections of PLANTS FOR CONSERVATORIES, FLOWER BEDS, &c., which have ever been offered in the neighbourhood of Reading.

In addition to a quantity of Geraniums, Calceolarias, Cinerarias, and other plants, now in bloom, J. SUTTON and SONS have a large stock of Verbenas, Petunias, and other plants in pots, 4*s.* to 6*s.* per dozen. Also a spendid collection of Fuchsias, by name, 7*s.* 6*d.* per dozen. A large stock of Coniferæ, and other Evergreens.—Reading Nurseries, May 11.

PLANTS NEW AND CHEAP.

HENRY WALTON is now sending out the following choice Selections of Plants, at very low prices.

TRUE DRUMHEADS FOR CATTLE selling by THOMAS WELLAND, at the Surrey Gardens, Wheeler-street, Godalming, Surrey, packed and delivered at Godalming Station, at 3*s.* 6*d.* per 1000.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

HALLIMAN'S REGISTERED FRUIT PROTECTOR.—The effective power and utility of these Glasses cannot be expressed. The trees and fruit always enjoy the free air; the richness and flavour of the fruit being increased. The Glass has been tested; the expense will be so small, that a wall 18 feet high and 600 feet in length can have a sufficient number placed on it for less money than a common Vinery costs building.

C. H. can now manufacture them at 10*s.* per dozen, 4*l.* per 100, 38*l.* per 1000, 4 inches; 6 inches, at 15*s.* per doz., 6*l.* per 100, 57*l.* per 1000, for ready money. Any orders C. H. is favoured with will be duly attended to, and sent out in any numbers required, with printed directions for use, and nails.

C. HALLIMAN, 1, Queen's-place, Norland-square, Kensington, Middlesex.

GARDEN ENGINES, SYRINGES, &c., &c.—CAUTION.—The well-known reputation of READ'S Engines, Machines, and Syringes, has led to the nefarious practice of placing Cards in Shop Windows, with the words "READ'S PATENT" upon Syringes of the very commonest description. R. READ begs to caution the Public against being deceived by such false representations, as many of these Instruments upon trial will be found defective and useless. READ'S Instruments may be known by the Royal Arms, and the words "READ'S PATENT."

Manufaactured only at 35, Regent Circus, Piccadilly.

THE CHOICEST AND MOST EXQUISITE ITALIAN and ORIENTAL PERFUMES, for presents.

Eglantine,	Musk Rose,	Coumarine,	Patchouli,
Heliotrope,	Moss Rose,	Sandal,	Violet,

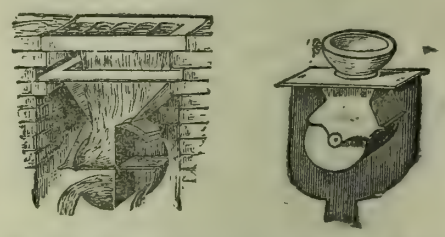
HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

BOILERS OF ALL SIZES TO BE SEEN IN OPERATION, WARRANTED THE BEST.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, HOTHOUSE BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, solicit an inspection of their various Works completed and in progress. Horticultural Buildings of every variety. BOILERS of all sizes to be seen in operation, and which they warrant to be the most effective and economical of any in use. The largest size Boiler is now effectually heating three extensive ranges of Forcing-houses, 230 feet by 22 feet, all Span Roofs and lofty, containing upwards of 50,000 cubical feet of air. Also various small and intermediate size Boilers, some of all sizes in operation. The consumption of fuel is very moderate, and the fires will continue from 10 to 15 hours without attendance. The extensive arrangements now in full operation on their premises, enables them to build to any extent, and at very moderate prices. Hothouses, Greenhouses, Conservatories, Forcing-pits, Frames, Glass Lights, &c. A very extensive collection of Stove and Greenhouse Plants, which are sold at very low prices. Plans, Estimates, and Catalogues forwarded on application.
J. WEEKS and Co., King's-road, Chelsea.



PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, King's Road, Chelsea, near the Bridge.

RAPID BUTTER MAKING.

ANTHONY'S PATENT AMERICAN CHURN was again tried on Saturday, at 97, Newgate-street, parties bringing their own Cream. In six minutes from the time of putting in the Cream, at a temperature of 58°, from nearly 4 quarts, 3 lbs. 10 oz. of good firm butter of most excellent quality was produced. The human hand was never used in its manufacture; the butter-milk being expressed by the dasher, and rendered fit for use.

KEY and MITCHELL, sole Agents for the proprietors, 97, Newgate-street, London.

A liberal allowance to the Trade. Parties infringing will be rigorously prosecuted.

WIRE STRAND FENCING, as fixed by R. S. NEWALL and Co., is cheaper, stronger, and more durable and elegant than any other Fence hitherto introduced.
COPPER WIRE HOTHOUSE SASH LINE.
LIGHTNING CONDUCTORS.
GILT AND PLATED CORD FOR HANGING PICTURES.
Office, 130, Strand, London; Warehouse, Brunswick-street, Blackwall; Manufactory, Gateshead, on Tyne.

References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

THE STANWICK NECTARINE.
MR. J. C. STEVENS has the honour to announce that on WEDNESDAY, May 15, at 12 for 1 o'clock, by order of His Grace the DUKE OF NORTHUMBERLAND, and on account of the Trustees of a Fund for the Benefit of the GARDENERS' BENEVOLENT INSTITUTION, he will offer for sale by Auction, in his Great Room, 38, King-street, Covent-garden, Twenty-four Plants of the celebrated STANWICK NECTARINE. These plants are in pots, have been propagated expressly for the Charity by Mr. RIVERS, of Sawbridgeworth, and are the first specimens that have been offered for sale.
On the same day will be sold about 150 dwarf Apples, in 6-inch pots, grafted on the Pomme de Paradis (identical with the dwarf Apple of Armenia); many of them are in a bearing state, and very interesting little trees.

HORTICULTURAL IMPROVEMENTS.
STRAWBERRIES exceeding two ounces each in weight, and of delicious flavour, were grown on Roberts's Strawberry Tiles last season, and exhibited at the Horticultural Show at Chiswick, and at the Royal Botanic Gardens, Regent's Park, where they obtained the highest Certificate of Merit. No appliances hitherto used are equal to these Tiles for improving the flavour and keeping the Strawberries clean This is admitted by all who have tried them. As a further proof, many persons who have tried them have had a second and third supply, and will have much pleasure in answering inquiries, if any reference is considered necessary. They are not like articles of consumption, for when once purchased they will last for many years.
CELERY and CARDOONS of the most superb quality and size were produced by the use of Roberts's Sockets, and this season he introduces a new method of growing Asparagus, which greatly improves the quality and quantity of that valuable vegetable. He likewise gives a new mode of growing Grapes, Peaches, Figs, and other Wall Fruit, and has recently registered a Ventilating Flower Pot, which will be found invaluable to Scientific and Amateur Gardeners.
An illustrated pamphlet, with particulars and testimonials, can be had by enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London, where these inventions may be inspected.

STAR NURSERY, SLOUGH, BUCKS.
W. R. BRAGG begs to inform the Floral Public that his Annual Spring Catalogue contains Descriptive Lists of E. Foster's new and superlative Pelargoniums; the best varieties of Pinks, Picotees, Carnations, Pansies, Roses, &c., and may be had on application.
GIPSY PRIDE, by far the most successful Pelargonium of 1849, may still be had; also Constance, Conspicuum, Narcissus, Armida improved, and all the best show varieties of last and former years, in extra strong plants.
NEW PANSY, HUNT'S "HELEN," has gained more first class certificates in 1849 than any other variety now offered, and, beyond doubt, is quite a leading white-ground flower; plants are fine and healthy. 5*s.* each.
GOLDEN YELLOW DAHLIA, OLIVER'S "GOLDEN DROP," gained four first prizes and first class certificates in 1848, &c., five of each in 1849. Plants in May, 10*s.* 6*d.*
NEW FANCY DAHLIA, BRAGG'S "LADY GRENVILLE," the most successful fancy Dahlia of the year; colour, deep red, distinctly tipped with white; as a guarantee for constancy, it has received 11 first class certificates, four extra money prizes, and two premier prizes in class showing. Plants in May, 10*s.* 6*d.* Sound ground and pot roots of all the best Fancy and other Dahlias, at moderate prices.—May 4.

The Gardeners' Chronicle.

COUNTRY SHOWS.—Tuesday, May 14: Hampshire Horticultural, and Cornwall Horticultural.—Wednesday, May 15: Manchester Botanical and Horticultural.

IN another column will be found a complaint, from Plymouth, of ADULTERATED GUANO having been palmed off upon some Devonshire farmers. Let us congratulate Sir ROBERT NEWMAN'S tenantry that matters are no worse. "Wood, straw, coal, and large fragments of bones," have some sort of value; and we may assume that the iron nails and other rubbish, spoken of by Prof. WAY, were inconsiderable in quantity. It is true that wood and other rubbish are not worth quite 9*l.* 10*s.* per ton; but they are worth something. Matters would have been worse, had the stuff been prepared by more cunning hands.

Must we again, for the hundredth time, inform the world that guano doctoring is a trade? and a very great one too; that, with the exception of what is procured from the only importers, or *from their authorised agents*, all guano is falsified? and that a substance, the cost of which when bought by the cargo is 9*l.* 5*s.* per ton, cannot be sold for less except by rogues? Yet it is notorious that "fine genuine Peruvian guano" is offered all over the country at a much lower price. A few circumstances that have come to our knowledge lately may explain how this is managed.

There are places near London where loam is sifted, and dried till it looks like guano. We could lay our hands upon a gentleman who has found a California on a hill side, so ample is the harvest of gold which he digs up. He is said to have a contract with one house for 30 tons of loam per week, at 20*s.* a ton—a little revenue of something like a thousand a-year, after paying expenses. A field of loam, assisted by a few such contracts, is, we suspect, a better *placer* than SUTTER'S mill itself.

There are caravans in London carefully covered in, so that the most curious eye cannot see their contents: they vary in size from that of a one-horse cart to a waggon; and will hold anything,—chests of tea, sugar-loaves, cheeses, tobacco—and even loam, if you don't mind dirtying them.

Such caravans, of the largest size, may be seen winding their way through crooked lanes, and narrow streets, and poor neighbourhoods, till at last they disappear near the banks of a river or canal, or some such place. At the time of their disappearance a pair of folding gates will be found to open and close mysteriously. If the passer-by looks within those gates he may find a wharf, perhaps, and all the signs of a busy trade. But what the trade may be can scarcely be discovered unless from the nods and winks and grins of the neighbouring peasantry.

In or near such places may be remarked heaps of blue billy (the stinking lime of the gas-works), refuse salt, crushed stones, and sundry other mysterious ingredients. There, too, are sometimes bags, which a little bird once opened for us, and which, to our surprise, were filled with guano, genuine as imported.

Now what can guano be doing there, in such doubtful company? Sifted and dried loam, blue billy, refuse salt, ground coprolites, crushed stones, are strange associates for an article worth 9*l.* or 10*l.* a ton; and one would think that the owners of the wharf would be alarmed lest, by some unfortunate accident, these matters might be mixed, and their reputation should suffer; especially when it is considered that the loam is uncommonly like guano, and that what it wants in smell the blue billy, if it did get mixed with it, might help it to.

But we must not be fastidious. Our native industry demands men of bold dispositions; and we have no doubt that adventurous merchants can be found, and in the midst of the most celebrated haunts of business, who would not feel acutely the inconvenience even if an awkward labourer were to jumble all these things together. Like true men of spirit, they would seek a remedy for the disaster—and sell the mixture for what it is worth. Now, what a thing is worth is what it will fetch; and if the mixture happens to fetch 8*l.* or 9*l.* a ton, then it is worth 8*l.* or 9*l.* a ton—that is clear. The seller has nothing to do with the buyer's ignorance; how can he undertake to measure a man's ignorance? He is naturally acute, himself, and he lies under no obligation to enquire into the amount of his customer's obtuseness. The mode we have suggested of repairing the accident would be perfectly in accordance with the maxims of trade observed by that part of the mercantile community to which such a man belongs. You may hear such doctrines defended any day at the Old Bailey.

There can be no doubt that accidents of this kind happen every day, and, which is more unlucky, continually to the same parties; so that their misfortunes become matter of public observation, and in the long run the gentlemen are set down as persons with whom it is not safe to deal. Their neighbours know them, and shun them. But their misfortunes are not heard of out of London: and the simple countryman, instead of suspecting his merchant to be a man sent to Coventry by fair dealers, looks with admiration at the wealth he is accumulating, and believes everything the knave may tell him. Hence the trash thus compounded finds a ready sale; and it is only when the mischief is done, beyond repair, that the dupes discover by their starving crops that a cheap bargain may be a very costly acquisition.

Since writing the above we have learned that a vessel is on her way to the Norfolk coast with a cargo of doctored guano, along with a few tons of guano genuine as delivered from the West India Docks; and that another is loaded for Newcastle, or some port in the north.

We also hear that 100 tons of London-made guano has just been returned from Yorkshire to a notorious dealer in the article, and that in consequence his trade is not quite so brisk as it was.

THE following extract from the Report of the Council of the Horticultural Society to the Anniversary Meeting, May 1, will have some interest for those who think of visiting the ensuing Exhbitions at Chiswick:

"For many years the Exhibitions at the Garden were accompanied by such constant fine weather that precautions against rain appeared needless. From 1833 to 1843, a period of 11 years, only two afternoons out of 33 were wet, and of these one was very slightly so. In 1845 and 1846 every day was fine; but since that time the weather in May, June, and July has changed so much, that out of nine meetings, in 1847, 1848, and 1849, five have been more or less stormy. In 1849 one day only proved wet, but so much inconvenience was then experienced that the Council have felt obliged, from a regard to the convenience of visitors, to endeavour to devise such a remedy as is possible where very large numbers assemble in the open air.

"With this view the old entrances to the Garden have been paved and drained, and a new double entrance has been opened into the Arboretum, from the Duke of

Devonshire's road, whence a gravel walk, 630 feet long, and 15 feet wide, has been made as far as the large Conservatory. On either side of this walk the tents will be pitched, and it is expected that a dry line of communication will be secured, in the event of rain, from one range of tents to the other. This alteration would not, however, have alone completed a convenient approach to the tents from the more distant entrances to the Garden, and therefore it has been found desirable to construct another gravel walk, 15 feet wide, and 667 feet long, from the old gate in the Duke of Devonshire's road as far as the new approach to the Conservatory. In doing this the opportunity has been taken of reconstructing the Flower Garden, which had for many years been much in want of remodelling. The Garden Committee, under whose charge these works were placed, availed themselves of plans prepared by Mr. Glendinning, to whom the execution of the groundwork and planting was also intrusted. The Council trust that this operation will be found to have added greatly to the convenience of visitors to the Garden, as well as to have improved its appearance. In order to render these alterations useful to the Exhibitors, a yard expressly for the purpose of receiving their waggons and carts has also been formed out of a portion of the orchard, in the neighbourhood of the tents."

Some suggestions which we lately ventured to make as to the possibility of economising the Waste Steam of factories, by applying it to the purposes of cultivation, were met *in limine* by this inquiry, "How is the heat to be maintained on Sundays and other days when the engine fires are put out?"—To that objection we offer the following reply:

Upon reading the observations now alluded to, Mr. Dillwyn Llewellyn, of Penllergare, tried the following experiment. From a small 8-inch cylinder engine, employed by him for agricultural purposes, this gentleman conducted a jet of steam for *twenty minutes daily*, through an inch iron pipe, into a bed of rough stones, covered by a glazed frame. A journal of the temperature was kept for 11 days, with the following result:

STATEMENT of Experiment with Waste Steam, as a medium of Bottom-heat, made at Penllergare, 1850.

Date.	Time of Observation.	Thermometer.	
April.		Degrees.	
9..	12 Noon	51	Steam introduced about 12 [o'clock.
,,	5 P.M.	54	
,,	7 P.M.	56	
10..	12 Noon	68	Steam introduced.
,,	3 P.M.	73	
,,	5 P.M.	85	
,,	7 P.M.	96	
11..	7 A.M.	108	Steam not introduced.
,,	12 Noon	104	
,,	5 P.M.	98	
12..	10 A.M.	83	Steam not introduced.
,,	7 P.M.	79	
13..	10 A.M.	69	Steam introduced.
,,	6 P.M.	75	
14..	10 A.M.	82	Steam not put on.
,,	7 P.M.	79	
15..	10 A.M.	70	Steam introduced.
,,	6 P.M.	73	
16..	10 A.M.	81	Steam introduced.
17..	10 A.M.	76	Steam introduced.
,,	4 P.M.	79	
18..	10 A.M.	94	Steam introduced.
,,	5 P.M.	110	
19..	10 A.M.	108	Steam not introduced.
	6 P.M.	96	

From this it appears—1, that, although steam was introduced among the stones for only 20 minutes a day, the temperature was raised from 51° to 68° in the first 24 hours; 2, that the temperature continued to rise for many hours after the second application of steam, until the thermometer reached 108°; 3, that, at the end of 19 hours, the heat of the frame diminished; yet 4, that, at the end of *seventy hours*, the temperature still was 69°. This appears a conclusive answer to those who think that masses of heated water, or heated porous materials, like rough stones, will become so reduced in temperature by a few hours' withdrawal of the prime heating power, as to endanger the plants cultivated in houses thus warmed.

We have no account of the external temperature at Penllergare during this trial; but we find that the minimum night temperature near London on the 10th, 11th, and 12th of April, during which steam was discontinued, was 34°, 34°, and 36°, on those days respectively.

ON THE CONDITIONS ESSENTIAL TO THE MOST PERFECT CULTIVATION.—No. XIV.

One of the best practical gardeners of the day (Mr. Barnes, of Bicton), in alluding to a successful mode of Pine culture, very justly states that it does not necessarily follow the strict adherence to any particular item in the category of requisites. The pit may be of the most improved construction, the heating apparatus the most efficient, facilities for atmospheric moisture may wait upon the will, and the soil may be unexceptionable, yet but very imperfect success may attend the efforts of those directing the operations. And if this be true in one department of gardening, which t most assuredly is, it is equally applicable to every other department of practice. It is in a natural relationship between the agents employed that success must be looked for. In a certain harmony of parts consists beauty of proportion, and consequent gratification to refined tastes, which is the ultimate result aimed at by the artist in the studio, or the practical realiser in the field. And as in an otherwise beautifully proportioned statue, the general effect is destroyed by a deformed limb, or a too prominent muscle, so where a physical result has to be worked out, by the employment of certain natural agents, artificially applied, will success be reaped in proportion as the causes known are related to the results aimed at. It must be borne in mind, that no result in nature, whether it arises from causes naturally applied or directed by the hand of man, but bears a relationship to such causes, and that certain natural causes can only produce certain results. In the ordinary natural phenomena around us we do not recognise this, because we are not familiarly acquainted with the nature and influence of the agents employed in the great laboratory of Nature. We know that in the movements of the planets some particular body will occupy a certain position in reference to another body, on some given moment, it may be years in the future—as, for instance, the eclipses of Jupiter's moons; because we know the process by which such a calculation can be arrived at, and we feel such a degree of certainty upon the result of such calculation because we know the relationship between the cause and effect.

Now, in the operations of cultivation, success will ever attend in proportion as we can make ourselves acquainted with the relation which certain natural agents bear to certain results; and the science of gardening must be based upon such principles. It cannot be said that, famous as English gardeners are, they have as yet established a correct code of practice founded upon scientific data, although—and it is much to be regretted that it is so—every one who writes an article in the present day deems it part of his duty to attempt to account for his results upon scientific principles. I say that such a course is to be regretted, because the principles sought to be established are often erroneous ones, and the result must be to make garden literature a chaos of presumed causes and effects, without any real relationship. How adverse such must be to the establishment of correct data will be evident to every one.

As every gardener knows with how much greater facility he can develope the capabilities of a plant when he has a knowledge of its natural history, it follows that if he could make himself acquainted with the principal facts in the nature, habit, locality, and habitat of every plant coming under his care, the great difficulties he would otherwise have to combat are overcome at the very threshold of his proceedings. Till comparatively recent times in the progress of horticulture, the English gardener has been woefully deficient in the means to facilitate him in the acquisition of such knowledge. The introducers of exotics thought it enough to say with each specimen that it was a native of the Cape, or of Terra del Fuego, which, as far as practical utility was concerned, was saying nothing; hence the loss, in the early progress of gardening enterprise, of many valuable importations. Such losses have often been attributed to ignorance of the ordinary routine of gardening by the practitioners of the day, and perhaps justly so; but such can only amount to a negative condemnation on their part. The real culprits were the men who introduced plants without the requisite data for their cultivation. If a more liberal amount of useful particulars were not now conveyed with new plants on their introduction, I question if a knowledge of plant culture would so rapidly progress towards perfection—unquestionably one of the greatest aids a gardener can possess, after an acquaintance with the routine of his business, or profession, if "Elpidophorus" will allow the term, is facility for gaining a knowledge of the natural history of his charges; and independently of the great practical utility of such knowledge, it adds an interest to his daily routine, and gives an intellectuality to his pursuits. It elevates his calling to something beyond mere rule of thumb, and should give him a position beyond that which the common opinion of the world would award to him as a gardener even of to-day. Let us hope to attain that position. The acquisition of knowledge, as observed by Lord Brougham in his admirable "Discourse," independently of its application to the ordinary affairs of life, or in the more limited sphere of our several occupations, there is conveyed to us by its acquirement an inward satisfaction, a pleasure derived from the consciousness of such acquisition, calculated in the highest degree to elevate the man, to refine the morals, and to add an intellectuality, a dignity to his position. And it should be borne in mind by every candidate for intellectual eminence, by every one who is desirous of obtaining the highest mental gratification, respect, and moral value in the eyes of his superiors, that mere position or wordly circumstances can never influence him in the pursuit, or tend to give him a retrograde movement, worthy of a moment's consideration. The mind is become or is becoming the talisman by which to estimate a man's claims upon respect and social value; and let us hope that the couplet of Pope will become an acknowledged truism, that

> "Worth makes the man, the want of it the fellow,
> The rest is all but leather and prunella."

The above remarks, although somewhat irrelevant to the immediate subject of discussion, will, I hope be pardoned, because this is the last paper of the present series. Not that the subject is exhausted.

There are many points in the details of plant culture which no treatise upon principles, however elaborate, could ever hope to elucidate. But it has appeared to me that there is a golden rule applicable to routine, which every young gardener would do well to have emblazoned on the cover of his pocket-book in letters of gold. It should be this—Take care of the roots and the leaves, and the plant will take care of itself. *George Lovell.*

VILLA AND SUBURBAN GARDENING.

Few pursuits connected with gardening possess more real interest than the raising of seedling flowers. It is an interest which never flags, for no sooner has one "batch" done flowering than preparation is made for sowing the seed of another. Notwithstanding the improvement which art and ingenuity have effected with respect to the Calceolaria, there is still an ample field left for the employment of the amateur's leisure hours, and for the exercise of his skill. I would recommend those who intend to pursue this subject to avail themselves of the improvements already effected by hybridising, more especially as regards form and distinct colouring, and, above all, select those which are of robust habit. Cross-breeding frequently induces constitutional debility, and to save seed from weakly plants would only be perpetuating one of the greatest evils attending the raising of new Calceolarias.

When the flowers begin to expand, take two plants, for example, of distinct colours; and in order that the cross may be as perfect as possible, place them under a hand-glass, so as to prevent them from being fertilised by bees or other insects, or place them in a frame or pit by themselves, where air can be given, and with a small hair pencil distribute the pollen of the one variety carefully over the stigma of the other, and *vice versa*. In order to obtain as perfect a breed as circumstances will admit, it will be much better to breed from a few pairs in this way than to raise a miscellaneous chance mixture, because it will be a source of more interest to the amateur, and because a very small portion of seed will prove ample for his purpose.

When the seed is ripe, which will be readily known by the cracking of the capsules, let it be carefully looked after, and as soon as the whole is collected, the plants may be kept in a growing state, in order that the young shoots may lengthen 2 or 3 inches, when they may be layered precisely as Carnations are; when perfectly rooted, let the layers be potted into 3 or 4-inch pots, in which they may be housed for the winter. The best kinds should, of course, only be propagated, as room must be reserved for the seedlings.

The seed should be sown in the beginning of October, and when just sufficiently above the soil, the young seedlings should be pricked off into 6-inch pots, as they are exceedingly apt to damp off if permitted to remain in the seed pans. These will be quite advanced enough to be potted into 4-inch pots, in which they will establish themselves before winter; I have on some occasions sown the seed as late as January, and obtained a good bloom the following summer. The seeds, which are sown in autumn in pans, instead of being baked in a hothouse or greenhouse, should be placed under a north wall; and, if the weather is wet, a hand-glass should be suspended over the pans, and provision made to prevent slugs or other insects from attacking them. *Pharo.*

DISEASES OF PLANTS.

(*Continued from p.* 277.)

To the genus of *Punctures* belong—

7. *Albugo from aphides.*—"This is a white mould produced upon leaves by the effect of aphides, and which causes them to soften." This is Plenck's definition. I myself have never observed this mould resulting from aphides, and I therefore do not venture any opinion on it. I have however often observed another phenomenon known to naturalists. Aphides, when near their last metamorphosis, are covered with a white dust, and some also with a very fine soft hairiness, also white. In this state I have seen them in crowds sucking out their food, in their usual manner, from the young leaves or branches on which they rested. I have sometimes cleared them off so as not to leave a single aphis on the plant. When I have left it exposed to the sun, the branch, if very tender, has generally perished; but when I have removed the plant to the shade and watered it well it has usually recovered. In this case it seems to me, that this so called *albugo*, a simple effect of injuries of the genus of *punctures*, has been confounded with the disease called *mugnoio* (miller), which is a symptom of weakness in the plant. Although I am inclined to think that aphides generally avoid healthy plants, and only attack the weak or diseased, yet even supposing they will also attach themselves to the sound, it is also true that the first mischief is produced by the effects of puncture. This kind of albugo is most frequent in autumn, and towards the close of a hot and moist spring.

8. *Honey-dew of Aphides.*—"A sweet transparent fluid, which is found on the upper surface of the leaves of various trees, shrubs, and herbs." I cannot understand how this disease could ever have been classed amongst fluxions. The most ignorant are aware that this fluid does not in any manner proceed from the plant. It transudes, or is expelled by the aphides from two protuberances, which they have on the head and from the anus. Ants which are frequently found with the aphides, are most greedy of it, and thence it is concluded by many, that the former do not injure plants. *Honey-dew*, properly speaking, should at most, as a disease, be classed only as a phthiriasis, of which it is a consequence when this phthiriasis is one of aphides. It is true that the honey-dew falling upon branches and

leaves injures them, especially when young, but that is from a totally different cause.

9. *Phthiriasis.*—I should define this to be the attack of an immense number of insects crowding upon a plant. Although the aphides are the most common, yet the cochineals and some others cover in the same manner the branches, leaves, and flowers. On this account I class the injury under the general head of *Punctures.*

To the genus which I have called *Intrusion* should be referred, if I mistake not, the greater part of the specific diseases caused by insects when accompanied by their presence.

10. *Gall of the Oak.*

11. *Bedeguar of the Rose.*

The one and the other are in fact real *galls*, that is to say, excrescences closed on all sides, in the centre of which lives an insect. They are produced by a hole bored by an insect, into which it deposits an egg. In the first case the excrescence is fungoid, with a smooth surface; in the [bedeguar] it is covered with reddish filaments. The latter is formed by the Cynips rosæ, *Linn.* Of the former there are many species, one of which is found on roots. Naturalists have not much investigated the manner in which these excrescences result from the disturbance occasioned in the ordinary course of the sap, by the deposit of the insect's egg. But it is not the less true that the introduction of this extraneous body has produced the disease.

It was our Malpighi who first established the fact, having detected a little fly in the act of depositing its egg in an Oak leaf, by means of a kind of awl, corresponding to the ovary. Professor Gerbi of Pisa, after examining and refuting the theories of the formation of gall nuts, laid down by the most celebrated naturalists, adds one of his own, having chiefly in view the gall of the Carduus spinosissimus. He supposes it to be formed by an accumulation of solid matter, deposited by the sap of the Thistle itself, diminished by the nutriment taken by the egg and the larva, and that the form of the gall nut depends on the form of the egg, and of the larva round which the incrustation takes place. This ingenious hypothesis requires to be verified on other kinds of gall. Bosc, in speaking of galls in general, says that the result of all that has been hitherto written, is very unsatisfactory; and that we shall long be obliged to confess our ignorance of the reasons of the regularity in growth which these singular productions assume.

12. *Scaling.*—This is a swelling of the buds, with the transformation of the surface into little scales. It may be observed in the Willow for instance, of which the catkins are sometimes converted into a kind of knotted and scaly bunches. There is no doubt of its being caused by the insect which deposits its eggs within it.

13. *Verrucosity of Leaves*, or Leaf-like excrescences on the surface of some parts of plants.—Marchant, in the "Mémoires de l'Academie de Paris," for 1709, gives an account of a Radish plant which produced oblong tubers, from whence issued flowers of a cartilaginous texture, but otherwise like the ordinary ones. He presumed this to be due to the deposit of insects' eggs in the plant, or even that it might be produced by simple puncture, like the deformed pods produced by the Radish when attacked by aphides.

14. *Fleshy Follicles.*—These are fleshy protuberances on the surface of leaves, formed by the eggs of insects, as Plenck has described them. We see them more especially on the Elm, produced by an insect which lives in a little bladder apparently growing from the leaf; but this bladder is, in fact, a production of the insect itself, which deposits its egg withinside of it. Naturalists say that these bladders must be considered as formed of an exudation from the leaf occasioned by the puncture of the insect.

15. *Scab of the Olive.*—This name is commonly given to a disease of the Olive, about which there may be some confusion. The natural history of the insects that live upon this tree is but little known. It is not improbable that they only attack the trees already afflicted with the scab, and that it is by analogy only that the name of *scab of the Olive* has been given to the mass of insects which are thus rather the result than the cause of the disease.

TRADE MEMORANDA.

Messrs. Lee, of Hammersmith, have furnished us with the following information respecting Doling. They say in their letter, "we learn from the police, that Mr. W. B. Doling, the Forest, Lyndhurst, Hants, is a common hawker, therefore those nurserymen who trust him will understand the extent of their risk. We made enquiry, before executing an order for above 30*l.* worth of plants and seeds." Similar information has been obtained by Messrs. Henderson and Co., of Pine-apple-place.

Home Correspondence.

Spring Protection of Young Conifers.—Our spring frosts sorely try the constitution and injure the health of some of the most beautiful Conifers, by nipping their young shoots and stopping their growth at the time it should be most vigorous. The superabundant resinous sap exudes at every injured point, becomes hardened by the sun, and renders such plants unsightly and quite unfit to embellish a lawn. Some evergreens, such as the Box tree, &c., are also liable to similar injuries; but as their sap is not resinous, and they have the power of prolonging their growth through the greater part of the summer, which Conifers have not, they soon recover their luxuriance. To the temporary protection, therefore, of young specimen Conifers in April and May, I wish particularly to direct attention, as I believe it might be easily accomplished, at a trifling expense, by the use of bunting, or some other light close material. I say young specimens, because I believe when they attain the height of 14 feet in some localities, or 16 feet in others, they may be considered beyond the reach of ground frosts, which I imagine really do all the mischief. Attention should also be directed to those species which, being less excitable than others, are not liable to be disfigured in the same degree. Here the young Deodars, Webbianas, Cephalonicas, Douglas Firs, and Pindrows, have suffered most: Grandis, amabilis, and nobilis are but little injured, but the most secure of all is the beautiful and rare Nordmanniana. The buds of this valuable species are as dormant as they were on Christmas-day; thus they triumph over many of their magnificent congeners. Can any one oblige us with a scientific or practical reason for the fact, that while the young shoots of Conifers, Azaleas, &c., are quite destroyed by a May frost, those of the Horse Chesnut, &c., apparently quite as delicate and tender, are uninjured by such casualties? *Charles Lee, Hammersmith.*

Value of Flued Walls.—As several gardeners of eminence in their "profession" condemn the practice of working flued walls in spring, with a view to keep off frost; and as a friend of mine, an old gardener, who lives about 30 miles to the north of Edinburgh, informed me on the 29th ult., that his Peaches on the lower part of the wall, where of course the fire was strongest, were the size of blackbirds' eggs, and the wood fit for laying in, I have taken the liberty of asking whether the spring working of flued walls is condemned with sufficient reasons. My friend has always excellent crops, without covering of any kind, and from all that I have seen and read the out-of-door cultivation of the Peach is yet in its infancy. *A Peach Admirer.*

Food of Birds: Tomtits, &c.—As this subject is now fairly opened in your columns, on account of its important bearing both on the produce of the garden and the fields, as well as its being a case of life and death to many thousands of charming creatures, to whom has been given a power over that region into which man cannot soar; I trust that it will induce many of your readers to impart information, whereby man may in time know his friends from his enemies. To suppose that these numerous tenants of the air have not a task allotted to them which cannot be greatly interrupted without serious mischief to other departments of the great system of life immediately connected with them, would be inconsistent with any universal theory of natural dependencies, and at variance with many well known facts in natural history. Still, general rules are by no means infallible guides to a solution of particular mysteries. With regard to tomtits, I certainly believed they were in search of insects, until I examined the blossom buds on the trees as well as those which they had thrown down. In the former I found no insect, nor in the latter any sign of erosion from one; but the lower part of every calyx, and the embryo fruit which it envelopes, was simply divided by one clean transverse cut by a single stroke of the bill, the peduncle being nipped off as if by the same stroke in a corresponding direction. Not perceiving that any portion was removed, nor any sign of an insect having been present, I was led to suspect that the bird might be in search of some pleasant juice, perhaps the "liquor amnios" contained in the ovary; I therefore divided a few of the young fruit, and on tasting them, was just able to distinguish a delicate Almond flavour. That Tommy, although he certainly belongs to the epicurean school, was really in search of this nectareous drop, I will not presume to say; but, as I know one branch of his family feeds on objects not larger than a pin's point, he may possibly sip his nectar in like proportion; making up in essence and in number for the smallness of the quantity he may obtain from each sealed vessel; for he will go from flower to flower, throwing them down with great rapidity, until the ground is sometimes white with the blossoms. It is, however, by no means less probable that he may have been in search of insects, which at the time escaped my observation; but as neither Mr. Doubleday nor any of your correspondents have answered my request, that they would say what insects he is in search of, I conclude this at least is a part of the subject still to be learned. That the Cherry tree, in common with others, is subject to the depredation of insects, I am well aware; but that does not prove the case in point; neither does the account of the wild teazel, which might perhaps as appropriately be placed in the same category with Tommy's amusement upon a Sunflower, as to the nature of which I apprehend there is no mistake. From the correspondence which has ensued from my remarks on a portion of Mr. Doubleday's article on the valuable services of birds, it may be inferred that I am also amongst their persecutors. So far from that being the case, I have always encouraged birds of every kind, and strictly prohibited the taking of any nests whatever, not excepting the sparrows—

> "For thou, poor bird, perhaps mayest moan,
> Some passerella dead and gone."

Now, these birds fell under even Mr. Taylor's mild proscription, so that I am a greater protector than he. I was induced to encourage these daring marauders from having observed them following the scarifier and picking out wire-worms from the clods, until they had collected four or five (probably one for each of their young ones), which they packed up in a bundle and carried off direct to the farm buildings, and having fed their greedy families flew back for more. This account was published some years since in your journal, and notwithstanding the stares and shakes of the head, and various eloquent apostrophes with which I have been saluted in the market-place, I still hold the opinion that sparrows do infinite good, at least during 11 months out of the 12; and if farmers cannot take the trouble to keep them off their Wheat for one month, while it is ripening, it is a pity. It is not clear to me that they are not then in search of the Cecidomyia Tritici; for if they were feeding on the corn alone, it seems scarcely probable that they would leave so much scattered on the ground, which is often as much as they consume. *F. J. Graham.*

Vegetable Marrow &c., a good Covering for Railway Embankments.—"It has occurred to us, that Vegetable Marrows, Gourds, Pompions, and even Cucumbers (if really useful), might be profitably cultivated on railway embankments; in addition to some gain, such plants would produce an agreeable appearance on the embankments, and there can be no doubt that on south aspects, at least, they might be grown in perfection. They should be planted on well cultivated grounds, about a yard apart, on the summit of the banks, and allowed to grow with their heads downwards. The present is perhaps the very best time for raising the seed in pots, and at the same time the ground should be dunged and prepared for their reception in the middle of May, when they may be considered out of all danger from frost. *Hardy and Son, Maldon.* [Certainly, the French Gourds might be usefully grown on the waste banks of railways, and would add much to winter supplies of wholesome food.]

Which is the best Aspect for an Orchard of Dwarf Standard Apple, Pear, and Plum trees? Most books recommend the south-east as being partially sheltered from the cold north-east and the heavy south-west winds, the former of which are destructive to the blossoms, and the latter to the fruit when approaching maturity. It appears to me that there is so little chance of the fruit being blown off dwarf trees, that the latter inconvenience might be risked for the sake of a more complete shelter from the former, in which case south or even south-west will be the best aspect. Many consider north to be a good aspect for orchards and Hop grounds, as the backwardness of it retards flowering till the frosts are gone. Perhaps this might apply to perry or cider fruits, where quantity is the chief object, but not to table fruit, which must be thoroughly ripened. Can you give me, or direct me to information as to the extent to which aspect and inclination of surface affect temperature, either monthly or as an average of the year. Most fruit books refer with approbation to the old custom of putting pavements under fruit trees, to prevent the roots from getting into the cold or wet subsoil. Would you recommend this practice where thorough drainage is adopted? [No.] My object in asking is to judge whether I should give the preference for planting to some land which has a thin layer of stone (about 2 inches) at 2 feet from the surface, and another of 6 inches at 3 feet, both parallel with the inclination of the ground. I could remove the upper layer, but the lower must remain, as it would cost more to take it out than the land would be worth. Supposing land on the lias formation to be as well drained as that on the old or new red sandstone, would it be better or not so good for fruit trees? The sandstone marls are generally recommended, because they are deep, rich in lime, and frequently on dry subsoils. It appears to me that the lias formation is richer in lime, and if depth and dryness were obtained, would be at least as good. There is, at this present time, in my garden, a striking instance of the effect of retarding the flow of sap in producing early blossoming of fruit trees. A young Pear tree has blossomed on one small branch only, and on examination, I found a nail in it which had been driven through it by the gardener when nailing it to the wall. *R. Varden, Landown House, Worcester.* [If soil is warmed by thorough drainage, it matters little what its quality is, provided it is neither sand nor clay. As to aspect, we should prefer a western to an eastern.]

Hybrid Azalea.—I send for inspection flowers of a hybrid Azalea, which has bloomed with me for the first time this season. It was purchased some years since of Messrs. Lucombe and Pince, of Exeter, as a seedling raised between an American Azalea and the Indian Rhododendron arboreum (he believes), at Highclere. The plant is grafted on Rhododendon ponticum, and though flowering in the conservatory, to decorate which it was lifted from the open ground, and planted in a very large pot, it is perfectly hardy and evergreen. The cross seems a curious one. *A Devonian.* [This is an extremely pretty and curious cross; the leaves are evergreen, the flowers short, firm, and deep rose colour; yet the form of the leaves, their undulations, and their surface, are very like those of an Azalea pontica.]

Ants.—We would advise "Northwood" to procure twopennyworth of arsenic, and mix it with a tablespoonful of honey, thinning it slightly with warm water. Let him apply this to his walls with a common whitewash or painter's brush. If "Northwood" tries this remedy, we should like to hear with what result. *Baxter and Son, Lewes.*——Try a liberal supply of guano, as a top-dressing over them, or toads will eat them. *J. R. C., Pulborough.*——Strong gas-water from the gas-works will kill them; but it cannot be employed in-doors, on account of its smell. *W. H. Browning.*——Small quantities of good cheese and arsenic rubbed well together, and placed in their runs, will kill them. *George Mills, Gunnersbury.*——Let "Northwood" remove part of his

kitchen floor, and he probably will soon discover the source of that living stream with which his food and furniture are inundated. I speak from experience. Some years since my dining-room was similarly infested. Within a few minutes after the cloth had been laid for dinner, an advanced party of ants would take possession of it, and have a taste of all the good things on the table. Having passed some years of my life within the tropics, I could have stood this intrusion, but in course of time their numbers increased so much that the legs of my guests were not safe under the table. Up to this time I had been content with pouring an occasional kettle of hot water on the column which wound its way along the entire plinth of the house, while the housemaid did her duty within-doors. It happened, however, that very room was covered with a Turkey carpet, so that the brush, though worked by a willing hand, had but little effect in routing the enemy. When, however, I found my neighbours cry out, and fight shy of my beef and port, I became desperate, and removing the furniture out of the room, had two or three planks of the floor removed. The living mass that met my eye at once proved to me how utterly hopeless the mere destruction of a column of ants daily would be. I removed with a garden spade a stáble bucket nearly filled with ants and the dust and material of which they had formed their nest. I then gave them a few hours' rest, until I supposed all stragglers and foraging parties had returned to their quarters, when I poured some spirits of turpentine on the place where the nest had been. I kept the floor open for a few weeks, so that I might have an opportunity of seeing if any attempt was made at a new settlement, but up to this time I have not seen another ant within the walls of the house. Let your correspondent be as energetic, and the chances are, he will be equally rewarded. *Experto crede.*

Effects of the late Frost.—In your last *Chronicle* I observed statements made by two correspondents under the above head, which have somewhat surprised me, as well with respect to the alleged intensity of the cold as stated by one writer, and the destructive effects experienced by another; the former stating the thermometer to have fallen in the night of the 27th March to 2° (the accuracy of which statement I am inclined to doubt), and the latter enumerating a number of shrubs which with him in Suffolk have either been killed or have sustained injury, while with myself, living in what is accounted a cold and bare district (the Cotswold), hardly any of the enumerated shrubs (and I possess several of them), have been injured at all. My Deodars, for example (one of them from 15 to 20 feet growth), are in as healthy a condition as they have ever been, and I may say the same of the Cupressus torulosa (of about 10 feet growth), and others of that sp cies; nor has the Araucaria imbricata, insignis, and other Pines, Abies morinda, tree Pæonies, Arbutus, Aucuba, tree Roses, and other things mentioned by Mr. Barnes, been hurt. But one shrub of late introduction, not in the list, which I had hoped to have found (as has been stated), quite hardy, has, I fear, been killed—I mean the Taxodium sempervirens, which, though planted out only a year ago had attained a vigorous growth of about 4 feet, but it has now much the appearance of being dead, though I think not quite to the root. The Ilex latifolia is only rather pinched, and a Cryptomeria japonica too, though not yet planted out, and kept under glass, turned so brown during the earlier frosts that I feared I had lost it, but it has, however, again recovered its hue of health, though from what has occurred I must rather doubt its being altogether hardy. The Magnolias (grandiflora) against my house are also, I hope and believe, little if at all the worse for the last winter's frosts, but by the exposure to the cold of from 30 to 40 preceding ones they may have acquired a hardy constitution. I have to-day been looking over about 150 trees of not altogether an ordinary description, though none of them perhaps very rare, planted in a place that I dignify with the name of an arboretum, and I find that upon the whole they have withstood the rigour of the season very well. Of the Pines there planted, it seems to me that the Corsican (Laricio) is the most likely to prove a valuable tree; one planted when the collection was made 16 years ago is really a noble looking tree. *W. H., May* 8. [With us, in low imperfectly drained heavy London clay, Taxodium sempervirens and Cryptomeria have not even changed colour.]

The Weather.—From the 20th to the end of April the weather was cold and dry, with bright days, and two or three degrees of frost at night; under these circumstances the Plum and Pear trees bloomed and set their fruit in great perfection, and there appeared a prospect of a most abundant season; but suddenly, on the evening of May 2d, a sharp hoar frost came on, so that on the morning of the 3d the thermometer registered 23, or 9 degrees of frost; this seems to have destroyed nearly everything. Beurré Capiaumont Pears and some other late blooming sorts, seem to have escaped. It will be of interest to know if these sudden hoar frosts in spring are local, or in what situations they are most destructive; perhaps some of your readers in different parts of the country will give the amount of frost registered on the morning of the 3d; here we are neither high nor low, and the soil rather dry than otherwise—substratum sand. Peaches on south-west wall, unprotected, which had entirely escaped the severe frosts of March, and had set their fruit abundantly, are all killed. *T. R., Sawbridgeworth.*

Hartley's Patent Rough Plate Glass.—I am most thoroughly convinced from experience that nothing can equal "Hartley's Patent Rough Plate." I only wish I had used it for all my houses, &c. It keeps flowers in bloom weeks longer than any other glass, and completely gets rid of the necessity of shades. I have used it for pits and hand-glasses with great success; and it answers admirably for striking cuttings under it, even of the most delicate things. The time will come when no other glass will be used for horticultural purposes, roofs at any rate. I have seen many imitations of it, most wretched and imperfect substitutes, nothing but common sheet glass with one side roughened. Every one who has seen the patent rough plate is satisfied now of its efficacy, though they were very sceptical last year. *John Wills, jun., the Rectory, South Perrott, near Crewkerne.*

Societies.

Royal Botanic, Regent's Park, *May* 8.—This Society was unfortunate in having a wet day for its first fête this season. Without anything striking, if we except some of the Roses, the Azaleas, and Mrs. Lawrence's collection of stove and greenhouse plants, which were fine, the exhibition was not more than an average one. There were no tall Cacti worth mentioning. Orchids were far from being numerous, and the Pelargoniums, with one or two exceptions, were not sufficiently in bloom. H. R. H. Prince Albert inspected the exhibition at an early hour.

Collections of 30 Stove and Greenhouse Plants were shown by Mrs. Lawrence, of Ealing Park, and Mr. Cole, gr. to H. Colyer, Esq., of Dartford. In Mrs. Lawrence's group, which was greatly superior to Mr. Cole's, we remarked huge specimens of Eriostemon myoporoides and buxifolium, Polygala acuminata, Epacris grandiflora, a very fine Pimelea spectabilis, which could hardly be less than 5 feet through and nearly as much high, a mass of finely expanded flowers; a graceful bush of Chorozema Lawrenceana, Podolobium staurophyllum, the handsome yellow-flowered Oxylobium Pultenææ, the showy Gompholobium barbigerum, a plant which few flower well; a small G. polymorphum, trained to stakes, in the form of a bush, a much handsomer plan than that of placing it on a trellis; a nicely-flowered and highly-coloured Hovea Celsi, Boronia pinnata in charming condition, Adenandra speciosa, a good blue Leschenaultia, and some other plants. The best of Mr. Cole's 30 plants were Erica Cavendishii, Adenandra speciosa, Azalea Gledstanesii, a purple-flowered Everlasting, Hovea Celsi, not so highly coloured as it should have been, and a finely blossomed Clerodendron splendens.

Collections of 20 Stove and Greenhouse Plants were shown by Messrs. Green, Taylor, Frazer, and Pamplin. Mr. Green had Gardenia Stanleyana, with a good show of blossom, but hardly forward enough; a very fine Azalea Gledstanesii, insufficiently advanced in bloom; a pretty conical Leschenaultia formosa, the pretty Acrophyllum venosum, a useful plant; Ixora coccinea, a large red Azalea, two Everlastings, and the purple Epiphyllum Russellianum, trained on a wire trellis.—Mr. Taylor sent a handsome pyramidal Eriostemon buxifolium, Ixora coccinea, a pale pink Epacris, called limata; Adenandra speciosa; a buff-flowered Heath, named Albertii; and a large white Azalea.—Messrs. Frazers' plants were small, and incapable of comparison with the fine specimens supplied from the same nursery in former years. Among them were good plants of Erica propendens, Azalea indica alba, Pimelea spectabilis, Epacris grandiflora, and Privet-leaved Jasmine.—Mr. Pamplin had Genista racemosa, Hovea Celsi, some Azaleas and Heaths, and a good bush of the not very showy Pimelea lanata.

Collections of 10 Stove and Greenhouse Plants were numerous. The two best were furnished by Mr. Croxford, of Stamford-hill, and Mr. Laybank, of Norwood. In the former of these we observed a large Epacris grandiflora, well flowered and highly coloured; Adenandra speciosa, Erica propendens, E. Hartnelli, a blue Leschenaultia, the box-leaved Eriostemon, a prettily managed Epacris miniata, and Chorozema Henchmanni.—Mr. Laybank's 10 plants contained Tropæolum tricolorum, trained in the form of an upright cylinder, 4 feet high, and covered with flowers, producing a striking effect; a well-cultivated Boronia anemonæfolia, a white Azalea, Zichya coccinea, a badly-coloured variety of Gompholobium polymorphum, Erica Batemanniana, a handsome Heath in the way of Sprengelii; a well-grown and flowered Chorozema angustifolia, and a purple Everlasting.—Among the 10 plants from Mr. Bruce, of Tooting, which were placed next in point of merit, we remarked Azalea speciosa, a glowing red variety; a charming Epacris miniata, Aphelexis humilis, and Erica perspicua nana.—Other tens were produced by W. H. Gilliot, Esq., of Clapham; Miss Traill, of Bromley; Mr. Malyon, gr. to T. Brandram, Esq., Blackheath; Mr. Slowe, gr. to R. W. Baker, Esq., Mr. Stanly, Mr. Young, and others. In these collections we observed Erica Sindriana, which is noticed in another column; some nice bushes of Boronia anemonæfolia, which, on account of its sombre appearance, makes an ineffective exhibition plant; Oxylobium Pultenææ, one of the handsomest of yellow-flowered greenhouse shrubs; Erica vestita rosea, a charming purple Heath; and the strongly-scented violet-flowered Prostanthera rotundifolia.

Before leaving this part of the exhibition, we must not omit to mention that in the tent in which the stove and greenhouse plants were arranged, earthen terraces faced with turf have been substituted for the wooden stages on which the plants used to be placed, and with good effect.

Orchids.—The only collection of 25 was produced by Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon. It contained Lælia majalis, with one flower; L. cinnabarina, Cypripedium barbatum, with four blossoms; Odontoglossum pulchellum, Epidendrum bicornutum, E. macrochilum, aurantiacum, crassifolium, and variegatum, Lycaste cruenta, Cattleya intermedia, C. citrina, with two flowers; C. Skinneri, and C. Mossiæ, a finely-blossomed Dendrobium macrophyllum, moniliforme, densiflorum, cærulescens, and nobile; Phalænopsis grandiflora, Maxillaria tenuifolia, the little orange-flowered Saccolabium miniatum, Phaius Wallichii, and the larger variety of Brassia maculata.

Groups of 15 Orchids were shown by J. H. Schröder, Esq., of Stratford, and by Mrs. Lawrence. Mr. Schröder's plants consisted of Dendrobium triadenium, Devonianum, pulchellum, and densiflorum; Cymbidium eburneum, Burlingtonia rigida, Saccolabium guttatum, Oncidium bifolium, Cattleya intermedia, and Calanthe veratrifolia. Mrs. Lawrence sent Dendrobium nobile, moniliforme, secundum, and formosum; Cattleya intermedia, Cyrtochilum citrinum, Cypripedium barbatum, Phalænopsis grandiflora, Chysis bractescens, Vanda insignis, and Oncidium Papilio.

Ten Orchids were supplied by Mr. Beck, and Mr. Wooly, gr. to H. B. Ker, Esq., of Cheshunt. Mr. Beck's group (all in slate pots) contained a large and charming specimen of Dendrobium nobile, also D. densiflorum and fimbriatum, a highly coloured Cattleya Skinneri, and a good Epidendrum crassifolium. Mr. Wooly had Phaius grandifolius, with nine flower spikes; Lycaste Harrisoniæ, with a dozen open blossoms; Dendrobium nobile, Epidendrum cochleatum and crassifolium.—Messrs. Lucombe and Pince, of Exeter, produced an admirable Dendrobium cærulescens, some 4 feet high and as much through, growing in a pan about a foot deep, and we noticed elsewhere in the tents an example of the Bornean Cypripedium Lowei from Messrs. Rollisson.—Messrs. Veitch had Dendrobium cretaceum, from Moulmein.

Of Azaleas there was a large and grand display. Mrs. Lawrence had 12 excellent specimens, and a similar number was produced by Messrs. Frazer and Lane. The first group contained exquisita, double red, præstantissima, Lawrenceana, coronata, lateritia, speciosissima, Rawsonii, optima, one of the best reds, and Gledstanesii.—Messrs. Frazer had Broughtonii, Murrayana, violacea superba, purpurea superba; refulgens, a cone of glowing red; splendens; an admirable Chinese yellow; Fielder's White, fulgens, and lateritia.—Messrs. Lane sent speciosissima, picturata, white; triumphans, double purple, double red, indica alba, and others.

Six Azaleas were produced by Messrs. Green, Falconer, and Gilliot. Mr. Green's sorts were triumphans, indica alba, double red, coronata, variegata, and lateritia. Mr. Falconer sent quite a little tree of the double red; also fine plants of speciosissima, variegata, Favourite, Bianca, one of the best whites, and lateritia. Mr. Gilliot's kinds consisted of small plants of optima, exquisita, refulgens, and variegata.

Roses were numerous, and exhibited in beautiful condition. Indeed it would be difficult to surpass the excellence of many of the specimens in Mr. Lane's collection. Mr. Paul, too, had a plant of Madame de St. Joseph (a very fine Tea Rose), which was the admiration of everybody. Mr. Francis' collection also did him credit; and so did those produced by Mr. Rowland and others, to the amateurs. Mr. Lane's varieties were, *Hybrid Bourbon*: Chenédolé. *Hybrid Perpetual*: Baronne Prevost, Duchess of Sutherland (very fine), Géant des Batailles, Lady Alice Peel, Louis Bonaparte, Madame Trudeaux, Mrs. Elliott. *Bourbon*: Armosa. *China*: Fabvier, Miellez, lemon white.—Messrs. Paul had fine plants of *Teas*: Safrano, Taglioni, Cels multiflora, Madame de St. Joseph (alluded to above), Lady Warrender. *Bourbon*: Bouquet de flore. *Hybrid Perpetual*: Duchess of Sutherland. *China*: Mioland, and others.—Mr. Francis's sorts were, *Hybrid Perpetual*: Augustine Mouchelet, Baronne Prevost, La Reine, General Allard, Mrs. Elliot. *Hybrid Bourbon*: Charles Duval, Paul Perras. *Teas*: Elise Sauvage. *Bourbon*: Armosa, Souvenir de la Malmaison, Chenédolé.—Mr. Lane's yellow Roses were, Queen Victoria, Smith's Yellow, Vicomtesse de Cazes, Pauline Plantier, and Clara Wendel.—Mr. Paul had, in addition to the above, two Persian yellows, Harrison's Yellow, and Solfaterre. To the above sorts Mr. Francis added La Pactole.

Cape Heaths were plentiful, but generally insufficiently in bloom. The plants produced from Mr. Rucker's garden, and cultivated by Mr. Leach, were certainly admirable examples of successful Heath growing. Among them were fine specimens of Beaumontia, propendens, perspicua nana, vasiflora, Hartnelli, suaveolens, elegans stricta, favoides elegans, tortulæflora, aristata major, mutabilis, and dilecta.—Among Amateurs, Mr. Quilter, of Norwood, had the next best group. It consisted of mutabilis, viridis (not viridiflora or viridescens, but the true viridis of "Andrews," a scarce Heath with the habit of the vestitas), Sindriana, favoides elegans, fastigiata lutescens, intermedia, elegans, perspicua nana, ampullacea, vestita rosea, nitida, and propendens.—Mr. Cole had 15 nice Heaths; and groups of six plants were produced in good condition by Messrs. May, Williams, and Green.—In the Nurserymen's Class, Mr. Fairbairn had 12 good plants, some account of which will be found in another column, and so had Messrs. Rollisson and Veitch. In the group from Exeter, we observed a nice example of Per-elegans, a new kind; and Messrs. Rollisson had the seldom-seen primuloides and Sindriana. Some Seedling Heaths, apparently raised between aristata and Hartnelli, were exhibited by Messrs. Lucombe and Pince; but though very beautiful, as most Heaths are, they were not sufficiently distinct to merit more particular notice. This remark also applies to a seedling produced by Mr. Epps, of Maidstone, in the way of Dunbariana or, perhaps, tricolor verna.

Single specimens consisted of an immense Pimelea spectabilis from Mrs. Lawrence, Rhododendron Gibsonii from Mr. Lane, Boronia spathulata from Messrs. Veitch, Hoya imperialis from Messrs. Lucombe and Pince, Epacris miniata from Messrs. Rollisson, Pimelea Hendersoni from Mr. Warner, and some other plants of less interest.

New Plants were scarce. Messrs. Veitch had Medinilla bracteata, Fuchsia spectabilis (not in good condition), Pimelea Neippergiana, a pretty white kind, Stylidium ciliare, and Dielytra spectabilis.—Messrs. Lucombe and Co. sent Gardenia malleifera and Clerodendron Bethuneanum.—Mr. Taylor had Pimelea Nieppergiana.—Messrs. Henderson ditto, an Acacia called grandis, and Pimelea Verschaffeltiana.—Mr. Stanly showed a seedling Hovea.—Messrs. Veitch produced Cinchona lanceolata as a "plant of economical interest."—A cut spike of a small-flowered white Rhododendron called Bianca was exhibited by Messrs. Lucombe and Pince, and Mr. Stark, of Edinburgh, sent a yellow-flowered Wallflower, which was stated to be "violet-scented."

Pelargoniums.—As we have stated, these were numerous, but not sufficiently advanced in bloom. For 12 "new kinds" in 8-inch pots, Mr. Cock, of Chiswick, was first with Hope, Gulielma, Salamander, Pictum, Mont Blanc, Mars, Bertha, Orion, Rosamond, Pearl, Forget-me-Not, and Gustavus; 2d, Mr. Robinson, Pimlico, for Orion, Camilla, Negress, Armada, Isabella, Gustavus, Hebe's Lip, Forget-me-Not, Rosetta, Miss Holford, Cassandra, and Gulielma; 3d, Mr. Stains, New-road, for Forget-me-Not, Rolla, Centurion, Virgin Queen, Phyllis, Painted Lady, Pearl, Norah, Bertha, Minna, Gulielma, and Negress. Nurserymen (same class): Gold Medal to Mr. Dobson, gr. to Mr. Beck, for Cuyp, Agatha, Mulready, Gulielma, Rosalind, Mont Blanc, Chloe, Gustavus, Pontiff, Blanche, and Rosamond; 2d, Mr. Gaines, for Forget-me-Not, Pearl, Armada, Grenadier, Mont Blanc, Mrs. Beck, Juliana, &c. Mr. Parker's varieties, in 11-inch pots, were Adonis, Rosy Circle, Resplendent, Zanzummim, Pearl, and Negress. Mr. Gaines had Cotherstone, Gazelle, Emma, Negress, Pearl, and Ackbar.

Fancy Pelargoniums.—1, Mr. Robinson, for very fine plants of Empress, Fairy Queen, Jehu superbum, Anais, Queen, and Madame Miellez; 2, Mr. Moseley, for Nosegay, Statuiski, Anais, Lady Rivers, Yeatmannianum grandiflorum, and Lady Flora; 3, Mr. Stains, Queen, Madame Miellez, Statuiski, Nymph, La belle Africana, and Yeatmannianum grandiflorum.—Mr. Gaines' six consisted of Anais, Madame Rosati, Jenny Lind, Madame Miellez, Lady Rivers, and Ibrahim Pacha.

Of Cape Pelargoniums Mr. Parker had elegans, abrotanifolium, glaucum, holosericeum, reniforme, crispum major, ardens, bicolor, flexuosum, Blandfordianum, elatum, and quinquevulnerum.

Seedling Pelargoniums.—Mr. Beck had Rosa and Incomparable, two varieties of great colour, which we hope to see again. "Little, but good," from the same raiser, is also a promising flower. Other seedlings were produced by Mr. Hoyle and others, but the season is not yet far enough advanced for them to be seen in their true characters.

Cinerarias.—Messrs. Henderson, of Pine-apple-place, showed Speciosa, Cerito, Husseyana, Edmondsiana, and Beauty of St. John's-wood.—Mr. Henderson, Wellington-road, had Adela Villiers, Flora McIvor, Cerito, Matilda, Pauline, and Effie Deans.—Mr. Ivery sent Beauty of Peckham, Prime Minister, Gem, Alboni, One in the Ring, and Edmondsiana.—Mr. Robinson produced Fairy Ring, Edmondsiana, Newington Beauty, Amanda, Husseyana, and Brilliant.—Among Seedlings, perhaps the most promising were Lady Hume Campbell, and Madame Sontag.

Calceolarias.—Mr. Stanly showed Beauty Supreme, Solicitor-General, Enchantress, Chancellor, Madonna, and Don Sebastian. No Seedlings were produced worthy of remark.

Pansies were shown by Messrs. Turner and Bragg, of Slough, and Messrs. Maul, of Bristol. With the exception of the Duke of Norfolk, the flowers were generally small.

A collection of 30 well-grown British Ferns was produced by Mr. Williams, gr. to C. B. Warner, Esq.; and Mr. Wooly, gr. to H. B. Ker, Esq., had a group of 12 exotic Ferns. Alpine

plants were furnished by Mr. Turner, and Mr. Wood, of Norwood.

HAMMERSMITH PANSY EXHIBITION, *May* 3.—Amateurs—24 blooms: 1st, Mr. Treacher; 2d, Mr. Scotcher; 3d, Mr. Parsons; 4th, J. H. Brown, Esq.; 5th, A. Lane, Esq. Nurserymen—36 blooms: 1st, Mr. Turner, Royal Nursery, Slough; 2d, Mr. Thomson, Iver; 3d, Mr. Bragg. A first-class certificate was awarded to "Mr. Beck," a flower of much promise, raised by Mr. Turner; and to it was also awarded the Vice-Presidents' prize of one guinea. Amongst the varieties shown in the various collections we noticed particularly fine specimens of Queen of England, Almanzor, Mrs. Hamilton, Ellen, Mrs. Beck, Miss Thomson, Duchess of Rutland, Penelope, Caroline, Sir R. Peel (Bragg), Climax, Princess, Constellation, Bellona, Rubens, Miss Edwards, Duke of Norfolk, Addison, Leader, Juventa, Mrs. Bragg, Viceroy, Example, Ophir, Emma, Malvern, Disraeli, Rainbow, Lucy Neal, Sambo, &c. The flowers were produced in excellent order, and altogether the meeting was one of the best which has been held under the auspices of this Society.

IPSWICH AURICULA AND POLYANTHUS SHOW, *May* 2.—1st, Mr. Marshall, for Lee's Colonel Taylor, and Grime's Privateer; 2d, Mr. Scotchmere, Smith's Waterloo and Grime's Privateer; 3d, Mr. Woollard, Baldiston's Susan and Grime's Privateer. White-edged: Mr. Kerridge, Townsend's Lady Duncan and Wild's Bright Phœbus. Self prize: Mr. Woollard, Woollard's Margaret, Seedling; Mr. Barker, England's Hope. Polyanthus: Mr. Woods, Flare up. Seedling: Mr. Woods, Agitator. Mr. Woods obtained first and second prizes for Polyanthuses, of which he is an extensive cultivator. *Ipswich Chronicle.*

Reviews.

The Statistical Companion for 1850. By T. C. Banfield, Esq., and C. R. Weld, Esq. 12mo. Longmans, pp. 144.

Now that the world has learned to estimate more justly the relative value of facts, surmises, suppositions, and queries, statistical enquiries have assumed importance in the eyes of the ordinary reader, while intelligent men continue to place them in the highest ranks of human pursuits. We therefore entertain a confident belief that the little work before us will be received with a hearty welcome, relating as it does to things social, mercantile, rural, fiscal, geographical, medical, and political, in short to every subject about which civilised society is interested. It will also be a useful guide to the investigators of statistical evidence, by showing in what direction there is the most pressing necessity that enquiries should be directed. A glance at the pages will show that the Statistics of Gardening and Farming are among those on which we have the smallest amount of information; and it is to be hoped will convince the members of the House of Commons of the monstrous error they committed in refusing to give the Government authority to call for annual detailed returns as to the different branches of rural industry.

The only fault that strikes us in the work before us, except its brevity, is its arrangement, or rather want of arrangement, and its insufficient index. About the former there are typographical difficulties the force of which we readily acknowledge: but this circumstance should have drawn greater attention to the index, which, we regret to say is, as it stands, inaccurate and wholly insufficient. The price of the volume is however so small that the student will probably reconstruct it for his own use, by cutting two copies to pieces, and pasting the fragments together in such an order as may be most suitable to his own line of research.

The following table may serve as an example of the manner in which important facts are brought into distinct view.

STATE OF LAND IN THE BRITISH EMPIRE.

	Arable and Gardens.	Meadows, Pastures, and Marshes.	Wastes capable of Improvement.	Annual Value of Wastes in present state.	Incapable of Improvement.	Summary.
	Acres.	Acres.	Acres.	£	Acres.	Acres.
England ...	10,952,800	15,879,200	3,454,000	1,700,000	3,256,400	32,242,400

Miscellaneous.

Stanhopea cirrhata.—A stove Orchidaceous epiphyte, from Nicaragua, introduced by Mr. Skinner. Has not yet flowered. (Fig. 19.) A few pseudo-bulbs of this remarkable plant were sold at one of Mr. Skinner's sales, having been collected at Nicaragua by Mr. Warcziewitz. A couple of specimens in spirits enable me to define it. Among Stanhopeas it is unique, for the flowers being absolutely solitary, not in spathaceous spikes, and for the column being wingless, and extended into a pair of feelers like some Odontoglossums. Its lateral horns, too, are extremely short and fleshy. Its colours are unknown, but it does not promise to be a showy species of much horticultural interest. *Paxton's Flower Garden.*

Stanhopea ecornuta.—A stove Orchidaceous epiphyte, from Central America, whence it was sent to Mr. Van Houtte by Mr. Warcziewitz. Flowers white, with the base of the lip yellow. (Fig. 20.) This extremely curious plant differs from all the previously known Stanhopeas, in having a lip wholly free from horns, and without any break in its middle. It may be regarded as a species with the hypochil (or lower half of the lip), alone present. This body is described as being "ovate, obsoletely triangular at the end, very short. It has much the form of a slipper, extremely fleshy, of a very bright yellow-orange colour, passing towards the point into pure white, and mottled on its sides with handsome purple blotches. Four little tumours, two near the articulation with the column, and two near the point, indicate four abortive horns." The flowers are otherwise pure white, with a few purple spots near the base of the petals, which are short, firm, concave, and not reflexed, as in most other Stanhopeas. "The column is very short, very fleshy, compressed, rounded above, winged at the sides, channelled in front." "The flowers, which grow in pairs, are about 4½ inches across, and have very short bracts." *Paxton's Flower Garden.*

Stanhopea tricornis.—An Orchidaceous epiphyte, from Western Peru; plants of which were dispersed at one of Mr. Skinner's sales. Has not yet flowered. (Fig. 21). A very curious thing. The figure of the lip is most remarkable, there being a third horn at the base of the middle lobe of the lip in addition to the two always present at the side. In a figure sent home by Mr. Warcziewitz the petals are represented to be pink, and the rest of the flower white; the petals moreover are more fleshy, firm, and apparently incapable of rolling back as in the rest of the genus. Fig. 21 *a* represents a portion of the lip. *Paxton's Flower Garden.*

Fragrant Thistle.—"The air was filled with the aroma of a multitude of toffs, which the Bedouin children had gathered for us. I know no European flower which I could put in comparison, as regards odour, with this seemingly insignificant Thistle; and here, in Tunis, where kind Nature seems to have created it in such abundance, in order to overpower the pestiferous exhalations of the town, I have become too fond of it not to say a few words about it. One or two days after our arrival in Tunis, F— brought me a very ugly flower, a sort of vegetable polypus, as it were, which had neither leaves nor stalk, nor, as I supposed, smell. For want of a stalk, it was stuck on the end of a small twig. Almost offended at the imputation against my taste, implied by F—'s offering me so ugly a thing, I paid no attention to his present, but let it lie on the chimney-piece. Often, however, as I passed the spot I perceived a delicious odour, and in vain inquired where were the concealed beds of Violets or Mignonette from which it proceeded. Neither F— nor T— could give me any information on the matter. The perfume, meanwhile, grew stronger and stronger every day, and with it grew my amazement at the phenomenon. It was my despised Thistle which diffused its incomparable fragrance over the whole room. I found it limp and faded lying under a heap of newspapers; I took it up, and pulled out the pointed twig that had been thrust into its tender heart, entreated its forgiveness for having so mistaken its worth, laid it into a saucer of water, and behold it did forgive me; for its shrivelled florets expanded themselves again, and sent forth their fragrance more abundantly than ever. It is now the season when they are in bloom, and they stretch their heads by hundreds out of the earth; for they grow so close to the ground that one must actually dig them out, to get the flower entire. The exquisite perfume of this Thistle is universally acknowledged, for many fragrant essences are prepared from it." The foregoing is an extract from the Diary Tour in Barbary. What a pity it is that the fair authoress had not read Lady's Botany, or some such book, and told one the name of the plant at once. What is the ill-favoured but sweet flavoured vegetable? *Dodman.*

Garden Memoranda.

MESSRS. FAIRBAIRN'S NURSERY, CLAPHAM.—The plants here in general look well, and many of the Heaths, for which this establishment is so justly celebrated, are beginning to unfold their charming blossoms. E. intermedia, suaveolens, a very sweet-scented species; vasiflora, daphnoides, mutabilis, a beautiful specimen; Sprengelii, mundula, elegans, favoides elegans, vestita rosea, odore rosæ, fastigiata lutescens, and some of the ventricosas are already in flower, and Macnabiana, a useful spring-flowering kind, is reported to have been in full beauty for as least these three months past. Sindriana, a comparatively new kind, in the way of hiemalis, was likewise in blossom. It has a robust upright habit, blooms profusely, and will prove an acquisition, as will also a Devonshire Heath called Devonia, "let out" by Messrs. Veitch. It is a seedling of Mr. Story's, we believe, and certainly promises to be, when larger and better bloomed, a charming sort. The flowers have the form of those of ampullacea, and are brighter coloured than those of aristata, which is evidently one of its parents. Indeed, it is stated to have been raised between this species and Hartnelli. Our readers will regret to learn that the fine specimen of Cavendishii, which has been so often exhibited from this nursery at our great metropolitan shows, died within the last few days. It could not have been less than 25 years of age, and was green, vigorous, and apparently healthy to the last, when its "young shoots dropped down, and it went off suddenly." In the propagating house we observed some nice young plants of Dielytra spectabilis. This is readily increased here from cuttings of the very young shoots placed in silver-sand and covered with a bell-glass. On the shelves of the Camellia-house were many beautiful young plants of Boronia serrulata, and in the same house we noticed a rich scarlet Geranium called "Trentham Scarlet," a dwarf and apparently profuse blooming kind, which will prove suitable for bedding. Many of the young Heaths, of which there is an immense number here, are already in their summer quarters; they are protected from wet by soiled canvas coverings or "lights" which are easily removed or put on as occasion may require. The young stock in frames has wintered well, and exhibits the best of health.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

AZALEAS should be attended to as they go out of bloom, potted if they require it, and placed in a favourable situation for forming their young growths. Many plants, and particularly large ones, which received a liberal shift last year, will not have filled their pots so full of roots as to render re-potting necessary; and it is better to allow such to make their growth and set their flower-buds without additional root-room. This growth will of course be a moderate one, and when this is perfectly matured, and the danger of their starting again is past, we give them a slight shift, and place them in a cool house; in the new soil so supplied they continue, during the remainder of the autumn and winter, to produce roots, but without making any progress in the tops; and, the roots being thus in advance of the head, the plants are prepared to meet the flowering season with extra vigour; for in the size and colour of the flowers Azaleas so treated far surpass those which have been treated in the ordinary way. Though these useful plants succeed very well in ordinary peat, to which a small proportion of leaf-mould and sandy loam, with a liberal supply of sand, have been added, yet those who can procure Wimbledon peat, at a moderate expense,

will find it answer their purpose to do so, as the high state of perfection to which the Azalea attains in that soil is ample recompence. In potting large specimens of any kind of plants, and especially those in whose compost peat predominates, make use of tin tubes of about half an inch in diameter, to pierce the old balls in various directions, and fill up the holes so made with coarse sand or washed road-grit; thus securing a passage for the water into all parts of the ball. Hard-wooded plants, which have been recently potted, should be kept rather close till their new roots are in progress; and in fine afternoons they will be considerably benefited by a gentle syringing. During this season, when the greater part of the plants are in active growth, and require more warmth and moisture, those which are in flower should be kept by themselves, where their blossoms can be preserved by shading, free admission of air, and a drier atmosphere. As the cooler pits and frames are set at liberty, they may be made very useful during the summer by filling them with suitable composts, and turning out young greenhouse plants into them, there to make their summer's growth. Treated in this manner they make much greater progress during a season than when grown in pots, and are with less difficulty induced to form handsome plants. Young Azaleas, Camellias, &c., can by this treatment be induced to make double the growth; and thus acquire a vigour which will be maintained for years, and which is not so easily obtained under any other course of management. The principal points requiring attention are, to secure a good drainage, to give each plant sufficient space, and to elevate the surface of the soil as near to the glass as possible, allowing only sufficient height for the plants themselves, and a vigorous summer's growth. The extent to which this plan is adopted should be regulated by the facilities at command, for preserving them after they are taken up in the autumn, and potted, as the frames will then be required for other purposes.

FORCING DEPARTMENT.

PINERIES.—Maintain a steady bottom heat of from 80° to 85°, and attend to the watering with the strictest regularity. Success in the cultivation of the Pine depends on their being so managed as to avoid subjecting them to considerable excitement at one time, or sudden checks at another; the consequence of these would be to throw them into fruit prematurely, at the expense both of size and quality. CHERRIES.—Where the fruit is ripening, give abundance of air, and maintain a drier atmosphere; but let the trees on which the fruit is swelling have plenty of water, and to keep the foliage and fruit free from insects, syringe freely in fine weather. STRAWBERRIES should now be abundantly supplied with water, or they will change colour before they have attained their full size. MELONS.—Keep up the heat in the beds by adding fresh linings as they require it. If plants on which the fruit is near ripening require water, give it in the morning, that the vapour arising from the soil may pass off during the day. Keep the shoots thin and regular, allowing not more than three or four fruit to swell on each plant. As it is not necessary that Melons for preserving should be very large, those which are intended for this purpose may be left thicker on the plants than those which are grown for table, as in the latter case size is almost as much an object as flavour. Endeavour by all means to preserve the foliage of early plants in a clean and healthy state, that they may produce a second crop. Frames in which Potatoes have been forced should now be prepared for late Melons. Let the soil be good, 18 or 24 inches deep; and if the frames are not furnished with hot-water pipes, a bottom heat of 80° should be supplied by means of linings or fermenting material between the bed.

FLOWER GARDEN AND SHRUBBERIES.

It having been determined what each bed or border is to be filled with, the business now to be attended to is, to execute these arrangements as speedily as possible, and to use every means for securing their safety and success, that they may produce a full display of flowers as early as possible. The chief points then are to plant in good soil, and to protect the plants for the first fortnight from extremes of heat, cold, or drought. When it is necessary to water them, it should be done in the morning, as they are liable to be injured by late spring frosts if watered over night. I would still recommend the use of evergreen prunings as a protection against fierce sun and cold cutting winds. The surface of the ground may be left very rough, to prevent evaporation, until the plants are sufficiently established to admit of the branches being removed; after which, if the ground be dry, it should receive a good watering, and then, for appearance sake, should be made smooth with a small rake: or, if this course be not approved of, it may be made fine at once, and to prevent the escape of moisture it may be covered over with a thin layer of short Grass from the lawn, which the extending foliage will soon conceal. In either case the plants should be well watered immediately after planting, taking care to moisten the bed thoroughly. In planting, the distance asunder must of course be regulated by the stock of plants prepared; but if a fine early display be desired, the beds should be planted sufficiently thick to produce immediate effect, and as the season advances it is the easiest thing imaginable to thin them out. Never within our recollection have we seen masses too thickly planted, but we have often observed the ill effects of beds planted too scantily. It is a very common fault to plant too near the edges of the beds; in consequence f which the outside plants have to undergo a constant mutilation to keep them within the boundary. Care should be taken not to push the work on more rapidly than is consistent with its proper execution; many late spring propagated plants will be better if they remain a little longer in the frames, as unless fairly established before they are planted out, they will be a long time before they start into growth in a satisfactory manner. Where the young plants have been pricked out into frames of soil, attention should be paid to lifting them with a sufficient ball of earth and roots, and also to conveying them to their destination, and planting them as quickly and with as little injury as possible.

FLORISTS' FLOWERS.

TULIPS.—In the northern counties, the awning had better be kept off some time longer, of course the amateur must be the best judge in these matters; complaints reach us that Tulips generally are weak, many also are not blooming, arising from injury sustained last season. Seedling Tulips, in their various grades, should have the best care, for it is possible, as in the case of Ranunculuses, by increasing their growth, to have these bulbs bloom a year or two sooner than ordinary. If we recollect rightly it was Mr. Sweet, who by forcing seedling Hyacinths early, and by keeping them in constant progression, attained for the bulbs in one year the size they would have got in two under ordinary treatment; if such a plan or system of cultivation could be adopted with the Tulip, it would be a boon of no ordinary character to the admirer of these flowers. CARNATIONS AND PICOTEES.—If the surface soil in the pots bakes, it must be stirred. It sometimes happens in the case of potting with unprepared soil, that it shrinks from the side of the pot, leaving a space which allows free access to air, &c.; with a small blunt shell stir the soil deeply, running it round the interior of the rim. DAHLIAS.—Harden preparatory to planting out.

KITCHEN GARDEN.

Beds should now be prepared for Vegetable Marrows and ridge Cucumbers, by taking out a trench in one of the quarters, 4 feet wide and 15 inches deep; throwing the soil to the two sides, to raise them higher. The trench should be filled to the top with rotten dung, from the surface of the earliest Vine borders, or from any other convenient source; this should be trodden solid, and covered to the depth of 4 or 5 inches with part of the soil taken out in forming the trench. This should be done immediately, that the bed may have time to settle, before the plants are put out. Let old Mushroom beds be examined, by removing the soil as soon as they begin to go out of bearing. If the dung appears decayed or exhausted, the bed should be immediately renovated; but if, as often happens, the beds are found in good order, solid, and teeming with spawn, they should be watered moderately with tepid water, if they require it, and covered in a day or two afterwards with 2 or 3 inches of fresh loamy soil. In hot weather, the house should be kept as cool as possible, and a moist atmosphere obtained by frequently sprinkling the paths and walls with cold water; excessive evaporation should be allowed to escape by means of a top ventilator. Let all the horse-droppings produced be carefully collected and stored up to renovate exhausted beds.

State of the Weather near London, for the week ending May 9, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

ADJUSTMENT OF THE ANIMAL AND VEGETABLE KINGDOMS: *J F and H S.* Answers next week.

ANEMONE SEED: *J R.* Though late it may be sown now. If the seed is good, and not covered too deeply, it will grow.‡

AZALEAS: *H H.* They are readily increased from cuttings made of the young wood. The more tender kinds had best be "worked" on stronger sorts.‡

BEEHIVES: *L L.* We never recommend dealers.‡

BOOKS; *Isaac Messenger.* Nobody uses Linnæus's artificial system now-a-days. If you want to understand it, look out upon old bookstalls, and you may pick up some account of it at the price of waste paper. Lee's Botany, Smith's Botany, Withering, &c., are all names familiar to dealers in old books.

BROWN'S FUMIGATOR: *Fylde.* We can only repeat what we have before said, that this is a very nice, useful, effective machine—much the best we have seen. But tobacco will not kill Gooseberry caterpillars.

CACTUSES: *Amateur.* You may thin out the branches of your tall Cacti now, selecting those, as far as it is practicable, on which there is the least appearance of bloom, cut close to the parent branch. The flower-buds may be thinned out too if you wish it; but it is seldom they are produced so plentifully as to require that. The "underground" shoots had best be removed after the plants have bloomed.‡

CUCUMBERS: *J Jones.* It is impossible to answer your inquiry, even if the specimens sent were examinable.

FLIES: *H T.* Stretch threads across the windows at the distance of a quarter of an inch. Flies will not pass them readily. As to killing them you must employ fly poison, such as any druggist will sell you.

HEATING: *Leyton.* Keep the plants as near the glass as you can; the distance will depend upon the strength of the plants and their kind. With hot water you will require no tanner's bark, nor do you need a pipe under the soil. A flow and return pipe along the front and end will give heat enough; only take care that the soil is *thoroughly* drained before the pit is built, and always water with luke-warm water.

HEMLOCK: *M E.* The "American Hemlock" is the Hemlock Spruce Fir, sold in every nursery. The scraps are sad trash. Artorhize is a foolish name given to the Psoralea esculenta; the word literally means "bread-root;" the plant is worthless.

INSECTS: *J S.* The black grubs are the larvæ of the common daddy-long-legs (Tipula oleracea), and the shining one is that of one of the click beetles (Elateridæ), closely allied to the wireworm. *W.—G B.* We are glad that our conjecture respecting the insects which destroyed your Roses has proved correct, and that you have been enabled to kill so many of them by hunting for them with a light. The insects now sent are the common millipedes (Julus pulchellus). Your ground must be very foul. You had better sink pottles of moss made of wire or open wicker-work in your beds, which will form a good trap for them. *W.—B V H.* The grubs which have eaten off your Auriculas are the larvæ of some kind of weevil, most probably Otiorhynchus sulcatus, the eggs of which have been deposited in the earth close to the plants, which should be carefully searched in pots standing in the vicinity of those already killed, as the female weevil doubtless deposited a number of eggs in different adjacent pots. We cannot undertake to name florists' flowers. *W.—Sub of Old.* The insect sent is the oil beetle (Meloe proscarabæus), a harmless creature. *W.—G S.* Your insect is of the same species as that mentioned in the preceding answer. *W.—G S W.* The facts detailed in your communication respecting the small black flies (Cecidomyia sp.), are new to science, and as soon as we can obtain fresh specimens, so as to determine one or two material points, we will communicate them to the public. Can you send us some more specimens *immediately*, to watch their transformations? We have forwarded a prospectus of the intended publication, "Insecta Britannica," to your private address. *W.—W W E.* We are much obliged for the specimens of Silver Fir bark, which is terribly infested with the young and eggs of the Chermes Laricis. Now, therefore, is the best time to wash the trees with hot water, if not considered too impracticable an operation. *W.*

NAMES OF PLANTS: *T Rooper.* One of the Cape plants is a morsel of some Drimia, the other is apparently Hypoxis villosa.—*W P.* Lycopodium clavatum. Rubus arcticus does very well in a northern American bed, where it is not overshadowed by bushes, and where the soil is spongy and damp.—*J K.* Gongora truncata, some Saccolabe near micranthum, and a Maxillaria near M. setigera; but the species of this difficult genus cannot be certainly determined without leaves and bulbs.—*J B.* Fuchsia arborescens and Dendrobium transparens, a very pretty thing; Oncidium guttatum.—*G H K.* Cerastium tetrandrum.—*M A G.* Dodonæa viscosa.—*L.* Some Broomrape, apparently the "Taller," or Orobanche elatior.—*G M.* The whole are varieties of Oncidium luridum; they are mere differences in colour.—*R S H.* Odontoglossum maxillare, a fine thing.—*A B.* Uredo effusa. Cut off the branches affected and *burn* them.—*A Young Beginner.* Genista racemosa. Let the fruit set before you stop them.—*Y Z.* The leaf gives no information; it may possibly be a Thysanotus, a greenhouse plant requiring the same treatment as a Gladiolus. Probably your Rhapis is badly drained; if not, the house is too cold for it.—*R Josling.* The novelty is Honesty, Lunaria rediviva—more scarce than new.—*H W G.* Oncidium Baueri?

ORCHIDS: *J T.* No doubt your house is much too dry. Dissolve oxalic acid in water, making the solution very weak.

PATENT PLATE GLASS: *Eboracensis.* See a letter in another column; we quite agree with the writer.

PAINTING WALLS: *Ballandyne.* In colouring the mortar of a new wall of blue limestone, if wanted of a dark colour, use Roman cement water; if of a Bath-stone colour, employ Atkinson's cement, mixed in small quantities at a time, so that it may be all used in about half an hour, or before it sets. *S.*

PAINT FOR IRON: *J S H.* Use one-third Stockholm tar and two-thirds gas tar, laid on while quite hot, with a brush, and spread as thinly as possible.‡

PEACHES: *R D.* Remove the sashes as soon as the risk of frost is gone.

PELARGONIUM LEAVES: *N K.* They are affected by the "spot," a disease caused by cold and damp.‡

POROUS POTS: *F.* We cannot reopen our pages to this question—it has been settled. You are quite wrong; as slate tubs and pots sufficiently prove. If you want arguments and further proofs, you will find plenty of both in some of our previous volumes.

ROBERTS'S TILES: *J E M.* We have no experience in their use; probably they would be useful for Vines, but slates will answer the same purpose.

ROCKWORK: *O C J.* Linaria Cymbalaria, Ivy, white Jasmine, Thyme, Savin bushes, Pelargoniums, Verbenas, Petunias, Honeysuckles, Ayrshire Roses, and all such things. Enquire at any nursery. We never recommend dealers.

SHOWS: *L S.* We do not think the plant is disqualified, provided the exhibitor grew it himself. Where he grew it is immaterial. Suppose he had hired the greenhouse—that would be the same case; his friend having lent him a corner in his greenhouse does not make the plant the less the growth and property of the exhibitor.

SEAKALE: *J E M.* If Seakale be not cut before it is too far advanced for use, the plants should not be cut down, for they will be stronger for the next season by allowing them to remain uncut.

TREES: *J W T.* The theory you refer to does not lead to such a conclusion as you draw. At the fall of the leaf tissue is more empty than at any other period; by degrees it fills, slowly during the winter, rapidly on the approach of spring, most rapidly just about the opening of the buds. *Therefore* timber should be felled from the fall of the leaf to midwinter. The bark of Larch trees felled in winter will nevertheless "run" in spring, because the act of felling a tree does not kill it; and the separation of the bark is a vital action. If you kill the Larch the bark will not run in that case.

WOODLICE: *B B.* Keep a toad or two in your Melon and Cucumber pits. The woodlice will then disappear.‡

MISC.: *J S H.* You had perhaps best allow your Acacia Robinia to grow as it likes.‡—*Sigma.* Do not warm water for watering plants in summer by putting a piece of quicklime into it, unless you want lime-water. "Pricking out" Cabbage plants in autumn checks their tendency to run to seed in spring.‡

SEEDLING FLOWERS.

CALCEOLARIAS: *Anon.* Your lucifer box and Calceolarias were smashed to pieces in coming through the post.*

PETUNIA: *R S.* Your seedling named Eclipse is a handsome violet-veined variety, and well worth cultivating.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

WHILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, May 11.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12*s.* to 13*s.* per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

HOME GROWN SEEDS, CARRIAGE FREE BY GREAT WESTERN, SOUTH WESTERN, OR SOUTH EASTERN RAILWAYS.

	per lb.	per gal.
THE ASHCROFT SWEDE TURNIP.—This is decidedly the best of all Swedes; it is very large and better shaped than the Liverpool Swede, which it somewhat resembles; it is perfectly hardy, and being of quick and strong growth it is so soon in rough leaf as to be much less subject to suffer from attacks of the fly. The colour is yellow, with purple top	1*s* 0*d*	6*s* 0*d*
EARLY SIX WEEKS TURNIP.—An excellent sort for early sowing to feed off for Wheat. *A Field of these Turnips grown (from Messrs. Sutton's Seed) by Mr. E. W. Moore, at Coleshill, gained the* 20*l. prize at the Farringdon Agricultural Show in December last*	1 0	6 0
SUTTON'S PURPLE-TOP YELLOW HYBRID.—*This sort is equal to a fine yellow Swede, may be sown much later, and keeps well till spring*	1 0	6 0
DALE'S HYBRID.—A fine green-top Turnip ...	0 10	4 6
YELLOW TANKARD.—Very excellent ...	0 11	5 0
LINCOLNSHIRE RED.—*The original stock of this superior New Turnip was presented to J. S. and Sons by Philip Pusey, Esq., M.P.*	1 0	6 0

Liverpool Swedes, Laing's, Matson's, Fettercairn, and other Swedes. Fine Green-round, Globe, Tankards, and other Turnips, true stocks of home growth, 20*s.* to 30*s.* per bushel (as see Sutton's Agricultural Seed Catalogue). True Italian Rye Grass, 6*s.* 6*d.* per bushel. Fresh imported Lucerne, 80*s.* per cwt. White Mustard Seed, 10*s.* per bushel. French Furze, 1*s.* per lb., and all other Agricultural Seeds at lowest market prices.

JOHN SUTTON and SONS, Nos. 7 and 8, Market-place, Reading, Berks, confidently recommend the above articles as being of very superior quality; *they beg also to refer to their Advertisement which appeared on the last page of the Gardeners' Chronicle on the 30th of March*, by which it will be seen that they supply GRASS SEEDS FOR PERMANENT PASTURE, either separate or mixed, AT MUCH LOWER PRICES than those usually charged. *Carriage free, as see above.*

BELFAST.

FLAX-DRESSING MACHINERY.—Persons wishing to put up Mills for Scutching or Dressing FLAX IN THE STRAW, can be supplied with the Improved Machinery recommended by the Royal Flax Improvement Society of Ireland, on application to the makers, MAC ADAM Brothers and Co., Engineers, Soho Foundry, Belfast.—May 11.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The MAY GENERAL MEETING will be held at the Society's House in Hanover Square, on WEDNESDAY, the 22d inst., at Eleven o'clock in the forenoon.

By order of the Council,

London, May 1, 1850. JAMES HUDSON, Secretary.

NOMINATION OF JUDGES.—On or before the General Meeting on the 22d of May, Nominations of Judges for Stock or Implements, at the Exeter Meeting, will be received from Members of the Society, who are requested to certify, from their personal knowledge, that the parties proposed are qualified and willing to act as Judges for the particular class for which they are respectively recommended, and who are unconnected with any Exhibitor of Stock or Maker of Implements, and have no direct personal interest in the Stock exhibited, as the breeder of any of the animals upon which they may be called upon to adjudicate.

LECTURE.—Prof. Way (at the request of several members of the Council) has kindly consented to repeat his Lecture: "On the Absorptive Powers of Soil, in reference to Manure," at the House of the Society, on Wednesday next, the 15th inst., at Twelve o'clock. All members of the Society will have the privilege of free admission.

The Agricultural Gazette.

SATURDAY, MAY 11, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 15—Agricultural Society of England.
THURSDAY, — 16—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 22—Agricultural Society of England.
THURSDAY, — 23—Agricultural Imp. Society of Ireland.

ON another page we publish a table containing the returns to inquiries about POTATO PLANTING IN IRELAND, with which we have lately been favoured. The following particulars will suffice to explain its meaning. As regards the second column it is not always stated whether the proportions named is meant positively, or only relatively to the existing population of the locality. In some cases the former is very evidently intended—but, generally, we imagine that the proportions "one-fourth less," "nearly as much," and so on, are intended to signify that relatively to the number of the surviving population or to the extent of land now in cultivation the quantity planted is so and so: for in every district the clearance system, emigration, pestilence, and famine have thrown so many farms waste, and have removed the small landholders and cottiers who were the principal growers of Potatoes to so great an extent, that though the actual portion of the Potato grounds of 1844, 1845, and 1846, now in crop is necessarily small, yet, relatively to the number of existing consumers, the difference is not so great. As regards the fourth column, it may be necessary to explain that the differences of the prices given, and the limits within which they are stated, are so wide, owing rather to the variety of sorts offered, than to any variety in the demand or supply of the article. The demand has certainly greatly increased within the last few weeks, and prices have accordingly risen considerably, but the supply seems ample everywhere: and in any case where the prices differ so greatly, as for instance from 2*s.* 8*d.* to 5*s.* per cwt., they refer to the different kinds in the market; thus, "Cups" may be 2*s.* 8*d.*, "Lumpers" 3*s.* 6*d.* to 4*s.*, and other kinds, as "Kemps," "Pink-eyes," "Russets," &c., 5*s.* or more. We add that the counties are arranged according to their latitude from north to south: and that from most of the counties reports have been received.

So much in explanation of the table—and, now, what does it teach?—that confidence in the productiveness of this, the most hazardous of all our cultivated plants, remains unbroken in Ireland—that everywhere much, and in many districts *all*, is being staked on the result of this year's Potato crop—that every class of the agricultural community, landlords, farmers, and to the utmost of their ability, cottiers, also—including even those who have professed their patriotism in a desire that Ireland may get wholly rid of it—are planting extensive tracts with the Potato—doubling their past year's efforts—hoping, with what confidence they may, for the large immediate benefit which will attend success—thoughtless both of the ruin they will reap within the year if the crop should fail, and of the constant idleness and wretchedness which, even if it succeeds, the crop is sure to entail upon their country. The facts seem to be that, on the average, twice the extent will be planted this year that was planted in 1849—that the proportion of the cultivated land devoted to this crop is rapidly approaching that which existed before the rot—and that the conacre system is ready to start again into full vigour on the security, if only they had it, of one single season of successful Potato culture. And as it is wholly useless attempting to dissuade the people from the course they are taking, so it seems unreasonable to waste time in lamenting the resolution or impulse which is at work upon them. In fact, the time is past for advice: never before has such an extent of the crop been planted so early. For good or for evil the die has already been cast on which the prosperity of the year is to depend; and, even though it had not, it would be folly to suppose that those whom the appalling realities of famine and of fever have not deterred, are to be alarmed by the warnings of the journalist. Besides, we doubt if hitherto there have been any fair motive to offer by way of dissuasion. No doubt the Potato, by the facility of its cultivation, by the thus permitted idleness of its cultivators, and by the hazardous character of its produce, is connected with all that has been reckless and wretched in the condition of the common people of Ireland; but what is that to them?—the circumstances in which it has placed them have long since become the standard by which their estimate of life is guided, and anything better than this has hardly been desired. And if it had, could any one have offered it as the reward of abandoning this root? Of the existing population it must latterly, with truth, have been said, that the multitude whom the Potato had reared, the Potato alone could maintain; and in many districts, even with their reduced population, it is still true that the Potato is the only crop capable of affording it maintenance. Offer the advantages of systematic agriculture to some generation succeeding that in which the exchange is made, if you will; but the probability of benefit to one's children's children will not be found enough to induce submission to self-injury: and in many parts of Ireland, it is, we fear, still the case, that the abandonment of the Potato crop would be a self-inflicted injury almost as fearful as its destruction. The thing might no doubt be done, slowly and gradually, emigration proceeding the while: this is *possible*, but with the knowledge of what is now proceeding, can we imagine it probable? As things are—prejudice, and recklessness, or listlessness, being still the chief guides of Ireland's fortune—it seems of all probabilities the weakest; and the only alternative open to the existing generation of people seems to be the Potato—its success, with the old precarious and miserable life—its failure, and ruin. Another alternative will, by-and-bye, be opened no doubt; the succession of Potato failures which may be expected, is certain, ultimately, to create the conditions under which a better system shall become possible; and already, in many parts, corn, green crops, and cattle would be able to give food and employment to the diminished population. How good it would be if the reduction in the number immediately dependant on agriculture could be effected artificially—by emigration, or by absorption in the manufacturing labour market. But this is not to be expected. Famine will doubtless be the severe instructor, and the people, even when it might be avoided, seem to be earnestly invoking the lesson it has to offer.

The conacre system, under which the Potato culture had become so excessive, has not indeed yet generally revived — the people are in the workhouse, and the farmers have not confidence enough to let the rent be dependant on the harvest, but the

security of a single year of successful Potato culture is enough to start it in full vigour; and certain of abuse as it is, we believe that in many places it is the only way in which the people can hope to maintain themselves. Hear Mr. TWINAM, of Kanturk, county of Cork: "I consider the abandonment of the conacre system a great loss for the poor. You, in your country, think it oppressive, and in many instances it may have been carried out oppressively, but no labourer ever came to engage work from me by the year who did not make it his first request that he should have at least one large acre of garden for every two to be supplied with labour; and this, for 8*l.*, generally gave 15 tons of Potatoes, which, with his pigs, always kept him above want." The conacre system then is sure to revive, with the first reasonable hope of a certain rent. The circumstances out of which it arises must be altered before it, and all the famine and wretchedness which the Potato disease has attached to it, can be removed from any locality. The population must be diminished—there seems no other remedy—and the utmost efforts of benevolence should be directed to the artificial method of doing it—for the natural method will, in all probability, again be in fearful exercise before another year shall have passed. Mr. SKILLING, professor of agriculture in Queen's College, Galway, writes as follows—and his remarks are essentially true of all the thickly populated districts in the south and west of Ireland:

"There will be at least *five times* as much ground planted with Potatoes this year as there was last; and the great emigration, the vast quantity of land that has been abandoned, and is now idle, must be remembered. The people that remain, with an unpardonable recklessness, appear to have thrown their whole minds and energies upon the root, which they have been eagerly engaged planting since December last. Those early planted are now coming over ground; they are still busy planting; other crops are comparatively neglected; some Oats and Barley are sowed. I fear the Turnip and other green crops will be nearly or altogether neglected. The fact is, they are staking their existence upon the crop, knowing that the population, though seriously diminished, cannot be fed and supported otherwise, except in the workhouse. Taking into consideration the great decrease of the population, and the idle land, my impression is, that in the west of Ireland there will be more land, according to the occupiers, under Potatoes this season than ever was seen before. Should the Potato succeed this year, the conacre system will be revived and in full vigour next season. I do not think the land will let so high as formerly, but it will be conacred largely at a price. It must be recollected that the conacre and the Potato was the only system that could support such a dense population upon the inferior soils of the south and west. All the judicious proprietors and others are getting rid of the population as speedily and quietly as possible, and laying down all the land to sheep and cattle pasture. Cultivation will not pay here now."

It remains, then, for another year's experience—fearful if bad—and not to be desired though good—to determine whether the agriculture of Ireland shall be a mere Potato culture by a population always on the edge of pauperism, or a field for the investment of farm capital in the employment of well paid labour.

IT was not to be expected that the reduction to figures of so large a mass of correspondence on the VALUE OF LABOUR, as is contained in the table of wages, published in No. 17, could be effected without some errors; and accordingly the following is a list of *errata*, which we place in as prominent a position as possible, in order that the corrections they require may at once be made.

All the asterisks in columns I and K should be replaced by the sign + (*plus*), and should be read—"and upwards." Mr. AITKEN'S statement of the price paid for digging drains, instead of being from "$\frac{1}{2}d.$ to $3d.$," should be from "$\frac{1}{2}d.$ to $\frac{3}{4}d.$" per yard. In Gloucestershire the quantities of beer or cider given to the harvest men is not stated correctly, the most material alteration required being in col. G, where in place of 1 gallon per acre it ought, in the cases of Frampton Cotterel, Hanham near Bristol, and Warmley, to have been 3 or 4 gallons per acre; and at Moreton in the Marsh, it ought to have been *|| or 6 quarts per acre, instead of * or two quarts. In Glamorganshire, again, Mr. THOMAS'S report is to be taken as true only of the mineral district of the county. The wages in the agricultural part of the county differ materially from what is paid around Caerphilly. We state this at Mr. THOMAS'S request, though of course the same remark holds true of every other contribution to the table; the prices stated refer not to the whole counties, but to the particular localities in each that may be specified.

POTATO PLANTING IN IRELAND, 1850.

The Columns contain answers to the following questions?—A. What extent is likely to be planted, compared with 1849?—B. What extent compared with the years before the Potato rot?—C. To what extent does the Conacre system exist in your neighbourhood?—D. What is the present price of Potatoes for seed per cwt?

COUNTY.	A 1849.	B 1844, 1845, & 1846.	C Conacre system.	D Potatoes p. cwt.	AUTHORITY.
				s d *s d*	
DONEGAL	One-half more	Nearly as much	It is reviving	2 4 to 2 8	T. J. ATKINSON, Ballyshan-
	More than twice as much	Very little short	Rarely seen	3 0	C. J. BOYCE, Stranorlar [non
	Double as much	As much as ever	Unknown	2 6 — 5 0	W. SINCLAIR, Lifford.
	One-fifth more	The greatest for 10 years, excepting 1846	Can hardly be said to exist	3 4 — 3 6	J. O'DONNELL, Ballyshannon.
DERRY	Fully one-fourth more	About a fourth less	Never existed	3 0 — 6 0	C. POLLOCK, Magherafelt.
	One-fourth more	One-half less	Ditto	4 6 — 6 6	S. ORR, Coleraine.
	One-half more	One-fourth less	Ditto	3 4 — 4 0	J. T. CLARK, Maghera.
	A great deal more	Nearly as many as I remember (63 yrs.)	Ditto	3 2 — 5 0	J. MOORE, Newtown-Limavady.
	One-third more	More than half	No conacre	2 8 — 4 0	H. HASLETT, Newtown Limavady.
ANTRIM	Rather more	Three-fourths	Never existed	2 6 — 5 0	JOHN LAMB, Belfast.

* One-sixth the quantity before the rot.	About double	About two-thirds	Reviving	4 0	R. HUDSON, Youghal.
	Three times as much	Less than half	Hardly reviving	3 6 — 5 0	D. CLANCHY, Charleville.
	More, excepting deserted land	Not one-third	Extinct	4 0	ALEX. TWINAM, Kanturk.
	Much greater extent	Two-thirds, by farmers	Scarcely revived	3 0 — 4 0	T. C. COLE, Innisshannon.
	Double	Very little short of former years	....	4 0 — 4 6	D. M. O'GALWAY, Clonakilty.
	One half more	Two-thirds of 1844	Scarcely exists	3 0	T. W. COOPER, Macroom.
	Three times as much	Very little short of 1844	Extensively in operation	3 6 and upwards	J. W. KINGSTON, Bantry.
	Greater	Nearly as great on occupied farms	Almost disappeared	4 0	H. LONGFIELD, J.P., Doneraile.
	More than double	Nearly as much	None	....	S. PIDDELL, M.D., Kilderny.
	Double the extent	As extensive in proportion to population.	Nearly done up	3 0 — 3 6	THOS. JENKINS, Kinsale.
	One-third more	One-half	Re-commenced	4 0	J. WILKINSON, Cloyne.
KERRY	One-fourth more	One-fourth less	Not in much request	3 8	J. O. SULLIVAN, P.P. and V.G., Kenmare.
	Twice as much	As many, according to the number of farms	None here	4 0 to 4 6	J. CREAGH, Tarbert.
	One-eighth more	One-half	Extinct	3 0 — 4 0	J. RICHARDSON, Ballyne, Pill-[town

ON INCREASING THE SUPPLY OF MEAT.

(*Continued from page* 251.)

THE next step in order to increase the supply of meat is the improvement of "waste" lands of every kind, where physical obstacles are not wholly insurmountable. These obstacles are formed by the position of the ground and the geographical aspects. But much land remains uncultivated which enjoy all the necessary properties for a useful cultivation; social obstructions and artificial regulations are allowed to interfere and to continue in existence for the very hurtful purpose of impeding the production of food—by far the most important consideration that can be contemplated. Cultivation must be introduced on every spot of ground where the produce will repay the labour, and afford some small encouragement for the outlay. There is certainly a daily and progressing advancement in the way of improvement, both in new attempts and in the augmented repetition of the old modes of proceeding; but the journey is much too slowly performed, and the increase of the population creates demands that cannot bear so long a delay. The vast quantity of labour that would be usefully and remuneratively employed would afford a livelihood to many thousands of families, and add very materially to the strength of society by the contentment which competence creates, and by the quiet which is shown when the necessaries of life are abundant. When individual inclination does not apply itself to the performance of such attempts, and where energy shrinks from the prospect of remuneration, it becomes a national concern that the earth be applied to the legitimate purpose of producing food for the population. Government having now recognised the principle, in the drainage accommodation, that objects of this nature demand the legislative attention, an extension of the principle naturally enough points to "waste lands," requiring the same application for the improvement and the use of the soil, as is given to wet lands, to free them of superfluous moisture. And the employment of capital in that way would be more generally useful—for draining benefits wet lands only, whereas the former case extends to lands of every description.

When the complete intersection of the country by railway communication has been effected, the facility of transit will be most wonderful, and will afford the means of sending and fetching, that cannot fail to exert a very powerful effect on the point we are now discussing. Many artificial manures are now known, and are or will be prepared in most towns in the kingdom, and can hence be carried to stations and depôts, for the use of the neighbouring lands. These fertilisers are best used in raising Turnips, and where that invaluable root can be grown other crops will follow, and very speedily introduce the rearing and fattening of animals. The same conveyance will carry every kind of produce to the markets in towns, and will bring in return everything that may be wanted. A very great recommendation consists in these manures being dry, light, and easily handled, and conveniently transportable. The possession of them offers a very great inducement to remote cultivation, where the other conveniences are not available. The price is moderate, and the carriage is not a large sum, and the efficacy is now well established under all ordinary circumstances of application. The first crops being raised by these adventitious assistances, cattle will be introduced to consume them—manure will be produced—grain crops will follow, and a systematic production will be established. A steady increase will be thus promoted both in animal and vegetable food.

It is sufficiently evident that the utmost possible cultivation of the earth must be first effected, as it constitutes the foundation of every improved state of animal or vegetable life, both in quantity and quality. The use of it supports every living thing, and therefore the state in which it exists must form the primary consideration.

All lands that are capable of being cultivated having been put into a productive state of bearing the most esteemed crops, and the best known way of using these crops being adopted, it remains necessary that the best breeds of animals be used in the appropriate localities, and fortunately the special breeds of animals are well known at the present day, which are fitted to the different situations of soil and climate. The limits of supply from the sources where cultivation is wholly or nearly altogether denied by nature, may be reached, but even in these situations the natural circumstances admit of improvements which have and will increase the quantity of animals that browse the herbage. Mountain irrigation has been very successful, and the better cultivation of the soil in all other districts will raise articles in greater abundance, and of a superior quality for use in feeding animals.

Food of an inferior quality, or a limited supply of the better kinds, will not rear and fatten animals in number, nor of an improved organization—the growth is stunted, the maturity is deferred, and the carcase is faulty in every respect of quantity and quality. The very first existence of the animal is rendered nugatory by the feeding of the calf from the pail, with the milk, instead of suckling, and by the substitution of broths and juicy preparations for the nutriment of the dam. [?] These insufficient materials spoil the animals at the very first outset—the intestinal offals are enlarged, the growth is stopped, and also the acquisition of the stamina of organic vigour, which forms the very first property in the value of animal life. Without constitutional vigour, the organic functions are unable to perform their offices, and the food of the very best quality is not properly decomposed and assimilated. Every experience shows that no substances yet known will nurse a young calf so well as the mother's milk; and the quantity of saliva is wanting which is engendered by the mouth sucking the teat, and which is so very useful in promoting the action of the stomach. The suckling of the calf forms the foundation of the future animal. For the purpose of making butter and cheese it only remains to allot a portion of the cows for that purpose, and the others for suckling, each purpose being kept separate and distinct without the hurtful intermixture of starving the animal to procure the other products of milk. Each purpose must be free of the other.

It is a very important point in the successful nurture of animals, that no stoppage takes place in the onward progress, that the food and the treatment be regulated to the capabilities of age, and that the advancement be regular and constant. There cannot possibly be a greater blunder in the management of animals of any kind, than to pinch the quantity of food, especially in the first year of the existence—a stunted growth never attains a profitable bulk, and the flesh is juiceless, meagre, and dry in the fibre. The first step is in the calf sucking the dam, as before mentioned, and the successive steps consist in the regular supply of juicy food, in the esculent cultivated green crops. The animals that are bred on the land enjoy all these advantages from the birth upwards, and yield the full fruition of their use.

The following then is a recapitulation of the means of increasing the supply of meat: 1, the conversion of all inferior Grass lands into a state of cultivation; 2, the better cultivation of arable lands; 3, the more extended and general use of green crops; 4, the improvement of all waste lands; 5, the use of the best breeds of animals; 6, the increase of the sources of supply of the lean animals; 7, breeding animals on the ground; 8, suckling of calves, and good subsequent treatment; 9, allowing a good maturity; 10, improved cultivation of every kind. *J. D.*

Home Correspondence.

Caution to all Buyers of Guano.—In consequence of the gross and wilful adulteration of Peruvian guano at the present time, we believe it to be the duty of every one, interested in agriculture, to lay before the public every serious case of adulteration, as a warning and example to others. With these feelings we give you the particulars of a most glaring case, which has lately come under our notice. In the early part of March last we received orders from Sir Robert Newman's tenantry at Nunhead, near Dawlish, Devon, for about 15 tons of Peruvian guano; and, as we were very short of supply here, and as it was required for sowing over the spring Wheat, we had this lot expressly from Messrs. Anthony Gibbs and Co., to supply them; and, in order to save time, obtained it by steam. On the arrival of the steamer here the guano was immediately transferred to the South-Devon trucks, and dispatched to Dawlish the very same day on which the steamer came in. About a fortnight since we received a letter from one of Sir Robert's tenants complaining most loudly of some of the guano sent to him; telling us that some of the bags were most grossly adulterated. We were startled at such an announcement. After a few minutes' consideration we recollected that a number of bags of guano came down for another party in the same steamer, and unfortunately they got mixed with ours. We sent our clerk to the steam-office immmediately, and found that 44 bags were forwarded to a small dealer in Cornwall. We started our clerk off by the train within an hour of the receipt of our complainant's letter, and explained the circumstance to him. He was perfectly satisfied, and told him (our clerk) that 8 out of the 29 bags had from us were adulterated, whereas the remaining 21 bags contained excellent and genuine guano. Our clerk brought home a bag with him (and the others remain with him for proof, should occasion require it). On examining the bag, we found a portion of guano mixed with all manner of rubbish. Shortly after the receipt of this bag, we sent a sample to Messrs. Anthony Gibbs and Sons, to Professor Lindley, and to Professor Way, the Consulting Chemist of the Royal Agricultural Society, who has favoured us with the following analysis:

"Water	12.73 per cent.
Organic matter and salts of ammonia ...	44.48 ,, ,,
Phosphate of lime	21.38 ,, ,,
Nitrogen in the first experiment	9.84 ,, ,,
Ditto ,, second ,, ...	9.74 ,, ,,
Mean nitrogen	9.79=11.90 per cent. of ammonia.

"The guano contained several iron nails, large fragments of bones, pieces of wood, straw, coal, and other rubbish. It is far inferior to good Peruvian guano, which should contain rather more than 17 per cent. of ammonia. The present sample is not, in my opinion, worth more than two-thirds of the price which would be given for a genuine article. From the nature and extent of the foreign substance found in the specimen, and from its inferiority in ammoniacal value, I should say that it was largely and wilfully adulterated.

(Signed) J. THOMAS WAY, 23, Holles-street, April 30."

Two days after the receipt of the above analysis we received the following letter from Messrs. Anthony Gibbs and Sons:

"London, May 2d, 1850. Gentlemen,—Your favour of yesterday is to hand, and your instructions regarding the shipment of your guano will be complied with. With regard to the questionable parcel lately shipped in the same vessel with some of ours, our mutual friend, Mr. Bourne, has no doubt sent you Professor Way's analysis, showing it to be highly adulterated; and if you will favour us with the name of the party who shipped it, we will try to take means to check his proceedings; at all events guard our customers against purchasing of him. (Signed) ANTHONY GIBBS and SONS.

"P.S. If the individual in question is a party in the habit of buying of us, we shall at once decline having any further dealings with him."

This is a clear and decided case of "wilful adulteration." We shall refrain at present from mentioning names, but we are fully prepared with the strongest and most efficient evidence if necessity requires that we should be called upon to go into a court of justice. We can prove on the testimony of the lighterman in the employ of Messrs. Anthony Gibbs and Sons, that he delivered the guano on board the steamer direct from their warehouse. Then we have the most complete evidence of all our clerks and warehousemen, the *employés* of the steam company, as well as the railway company, to prove that the guano was, immediately on the arrival of the vessel, transferred to the South Devon trucks. We have taken a great deal of trouble to sift this matter thoroughly, and we hope this will be a warning both to the shipper in London and the dealer in the county of Cornwall, never to have any more dealings with any guano excepting the genuine and pure article, direct from the only legal importers, Messrs. Anthony Gibbs and Sons. *William E. Rendle and Co., Seed and Guano Merchants, Plymouth.*

Pigs.—My experience in stock keeping has been so decidedly in favour of breeding and fatting of pigs, that I may, with advantage to many who think differently, give some account of my management. That I should do so is the more necessary from farmers having generally a very low opinion of the profit to be gained from breeding of pigs, and I cannot but ascribe their failures too often to the negligence with which this stock is looked after. On an arable farm of 200 acres my stock has been 12 sows and two boars, and their produce, according to the season, consisted either of

rising stores running in the yards, or on the leas or stubbles; or of porkers in the sties fatting for the market. From March to October my stock may be said to have lived loose on store keep, principally green food; and from October to March (the parent stock excepted) in sties, fatting on roots and boiled corn. The sows on an average gave me, one with another, 14 pigs a year each, so that in summer my stock was about 100 upon store keep, and in winter about 200, of which 180 were in sties finishing for market. The spring litters went off in January and February as large porkers of 30 stone each, and the autumn born as small porkers of about 7 stone each; the first realising about 5*l.* each, and the last about 30*s.* each, so that each sow returned about 45*l.* a year, and this amount there is no difficulty in obtaining, large pork selling at 3*s.* 4*d.* per stone of 8 lbs., and small pork at 4*s.* 4*d.* Success in raising of pig stock I found was to be attained only by attention to fully carrying out the following principles—viz., the accommodation for pigs must be sunny, dry, sheltered from cold wind, and yet well ventilated. Their sties being carefully protected on the north, east, and west side, and open only on the south; so that whilst no cold winds can have access, there should be no obstruction to the sun shining in and on to their beds. The pigs must be regularly and carefully attended; sufficient should be kept to wholly occupy their attendant's time, and to them should that attendant's time and attention be wholly given. An old man is better than a young one; and this is an office suited to one infirm or past general labour. The sows must never be permitted to farrow earlier than the end of March, or later than October. The cold of winter is fatal to many farrows, and young pigs are ill able to bear up against it. Provide roots (Potatoes, Kohl Rabi, Swedes, Carrots, and Mangold Wurzel) for their keep, aided with boiled corn, from September to June; and Tares, Clover, Beans, and Maize, green, from May to September. Breed from large strong sows with boars of the finer breeds, having in view the gaining of large farrows, good nursing, and a rapid attainment of weight; look to the mother for nursing, and the father to correct coarseness of form in the mother. Attached to the sties have a boiling-house with copper and food cisterns; and in front of the sties a yard for the pigs to be turned into. Attention to these points makes all the difference between profit and loss. *Hewitt Davis*, 3, *Frederick's-place, Old Jewry, London, April* 20.

Road Reform.—I fully believe and concur in all that Mr. Pagan advances; I say so from long knowledge of the circumstances of various turnpike trusts of east Sussex, and the adjoining part of Kent. I must instance the Rye and Flimwell trust, on which I began to act as soon as the law allowed me to take the oath, now more than 40 years since; the debt then 6500*l.*, but which for some years has been reduced to 500*l.*, the interest of which is 4 per cent., or 20*l.* per annum. On this road, in extent 23 miles, there are four toll bars, which I believe, taking into calculation the houses, gates, fences, toll collector, and often profit of the lessee, together with the treasurer's salary, the clerk's salary and his bill, the advertising of meetings, &c., the printing of annual statements, &c., the use of the room for meetings, cannot be much less than 300*l.* a year, thus I say that the public pay 300*l.* a year for the purpose of getting the 20*l.* to pay the interest. You will observe that I speak not of the surveyor's salary, considering that that would be required under any change of system. Now for another absurdity—I believe, not from mere conjecture, but from calculation, that there are 10,000 miles annually traversed in the parish of St. Pancras by the waggons and vans going to and returning from the luggage station of the North-Western Railway, and this 10,000 miles extra, in order to avoid the toll bar by old St. Pancras Church. Of the extra number of miles traversed by omnibuses, cabs, coal waggons, &c., I will not attempt a conjecture. I could give you many instances in Sussex where hundreds of miles are unnecessarily traversed, and doing infinitely more injury than if travelling on the open hard turnpike road. You, as a man of business, must see the loss to the community, and I believe in no other country but this would it be tolerated. I was surprised when reading in the *Agricultural Gazette* of the number of turnpike trusts in one union of Gloucestershire, as I had fancied that Sussex far surpassed any other county; but your correspondent at Robertsbridge can tell that within the circuit of 10 miles of that town there are 46 toll bars on numerous trusts. At New Mills, Derbyshire, the bars are thicker than sentinels round a besieged town, 15 within a mile and a half. The Duke of Richmond said that I made a very just comparison when speaking of the 12 trusts within the Rape of Hastings, by saying it was as though a regiment of 12 companies, and each company having an adjutant, a paymaster, and contracting separately for their bread, meat, &c. I have been told that those hitherto who have been anxious to correct these anomalies or abuses have been thwarted by the extraordinary influence of the solicitors or clerks; and so Mr. Cornewall Lewis found in the two bills which he introduced last session. You are aware that an amalgamation act has passed; good ought to be the result, but I doubt it; circumstances of trusts vary so much, as within the Rape of Hastings the debt of the Rye and Flimwell road is 22*l.* per mile, whereas that of the Hollington is 4200*l.*, others about 1700*l.* I have been in correspondence on this subject with gentlemen in various counties. I am desirous that a highway act should pass in order to correct abuses which I know to exist, that instead of an annual, a permanent surveyor, a man of science, for several parishes, and one not interested by the employment of his teams, &c., should be named. I am confident that you will agree that should a good and sound highway act pass, not leaving in doubt the roads being kept in repair, that it would be greatly for the interest of all excepting clerks and treasurers, on trusts at all similar to the Rye and Flimwell forthwith to apply the whole of the tolls to the liquidating of the debt. With respect to the trusts deeply involved, I regretted that Mr. Lewis's plan of having the bonds of the mortgagees valued by three indifferent persons was rejected, for it is true that the evil is each year increasing, and it is true that consequent on the railways many highways have become byeways, and *vice versa*. *W. P. Lamb.*

Foreign Correspondence.

Brussels, *April* 30.—I must spare you any travelling exclamations out of Belgium; but it is 13 years since I have done more than merely pass through it, and even that I have done this time with new eyes. Every inch of the road is worth a farmer's notice, and the more so from the minute scale which cultivation assumes; more and more, yearly, as the holdings become smaller, which I am sorry to hear they still do. Certainly no country in the world tells its whole story more plainly to the eye, or in closer detail, and though I have scarcely seen a yard of what you call a rich *looking* soil, yet the painstaking style of culture seems to set quality of soil at defiance. 'Farming' one hardly knows how to call it. It is an endless succession of allotment-grounds, which as the train flies along over the dead flat, as straight as an arrow from a bow, lies out on either side, as far as the eye can reach, and for hours together, without check or change of character. The total absence of hedgerows of course adds to this uniformity of effect; and the small patches of every kind of crop, with the immense quantity of hand-work going on upon them, might make an English farmer fancy himself going through the suburbs and market-gardens of some immense town, and wonder when he would 'get into the country.' But on it goes without variation for 20, 30, 40 miles on a stretch—every square foot of soil turned to account up to the very edge of the road, as if it had been bought, or hired, in 'building lots' at so much per yard (which indeed is not far from the truth), and the family of the occupier being frequently seen down *upon their knees* weeding and sowing, as if the care of it was as much a worship as a labour. This habit of kneeling to their work is very curious. It speaks more to the eye than a whole chapter on 'Flemish Agriculture;' and it is strange with all this labour and pains that the Wheat crops, which are very forward, should not show a more even and regular appearance. Here and there I saw a good crop, but wherever I could look up the furrows I observed that it was patchy, like land that had been irregularly manured, or had suffered from want of drainage. I should say that Flemish cultivation is more laborious than skilful. Under-drainage is in its infancy; indeed it can scarcely be said to have reached even that description. The Government is making great efforts to promote it, and has undertaken to provide pipe-tiles at a fixed rate to all who choose to apply for them. But how to lay them will be the difficulty, for outfall there is almost none, the ditches being all cut to a dead level, and the water standing in them within less than 30 inches of the surface of the land. Grain, however, is not the favourite crop. The thing most extensively and assiduously cultivated is a species of Rape called 'Colza,' large tracts of which continually meet the eye, looking like a field covered with Carlock; and the oil from this plant is preferred to any other kind for burning, and makes it a most profitable crop. Why is it not cultivated in England? The light it gives is far superior to that from Spermaceti oil, and the cake after the oil is expressed is excellent for feeding.——It is an interesting, and indeed a wonderful, sight to look down from one of the high belfry towers of Ghent or Bruges upon the immense panorama they command of this flat country. Far as the eye can reach all round, it extends like a close-woven carpet of many colours, the canals and ditches cutting it in long straight seams, with here and there, for the only variety of texture, a square dab of a plantation, every tree of which is pruned as if the very branches had been counted. The pruning, however, though somewhat severe, is not unskilful or rudely done, as it usually is in England, where it is done at all. The stem is not bared of its branches and left standing like a pole with a brush at the top; but the branches are lightened by taking off some of the heavier portions and leaders from them with an oblique cut, so as to leave them reduced in extent, but without apparent mutilation. This of course checks their growth, and as the tree gets higher the lower ones, to about one third of its height, are gradually taken off, leaving but a small wound, which soon heals. The timber is clean, therefore, but not large; and the chief fault, besides that of a somewhat ridiculous uniformity of *pattern*, is that this pruning *in the branches* is carried too high up in the tree, which is bad economy. Were it confined to the larger and lower branches, it would not be offensive to the physiologist, however objectionable in point of beauty and character. Many of those plantations, however, are being stocked up, and the land taken into cultivation, promising to obliterate shortly what little variety still remains in the landscape.——The suffering amongst the immense body of small owners and occupiers of land, from the low price of Wheat, is spoken of as extreme; but every one I have spoken to on the subject indulges me with an incredulous smile or shake of the head when I refer to the same thing as existing in England. How curious that five or six hours' passage of sea water should sustain on either side such strange incredulities and ignorances. "You talk of low prices in England! You don't know there what low price means!" is the favourite answer. The report of the warehousing system on Government loans about to be established in France, has however had a good effect on the markets here. A gentleman who has written very ably on agricultural-financial questions, here, M. Arrivabene, said to me yesterday, in speaking of the Corn-law question in Belgium. "There are two opinions in the Chamber; two *sides*: they do not argue; they dispute each other's facts. Nobody believes any body: so nothing but time can settle it and the next harvest!" *C. W. H.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A weekly Council was held at the Society's house in Hanover-square, on Wednesday last, the 8th of May; present, Mr. Raymond Barker, V.P., in the Chair, Earl of Lovelace, Hon. R. H. Clive, M.P., Hon. Dudley Pelham, M.P., Sir M. W. Ridley, Bart., Mr. Alcock, M.P., Mr. T. C. Blackden, Col. Blagrave, Col. Challoner, Mr. W. Clavering, Mr. G. Dyer, Mr. Fisher Hobbs, Mr. W. Miles, M. P., Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. Rowlandson, Mr. Villiers Shelley, Prof. Simonds, Mr. Slaney, M.P., Mr. Stansfield, M.P., Prof. Way, Mr. Wilson (of Stowlangtoft), and Mr. F. Woodward.

Sir Montague John Cholmeley, Bart., M.P., of Easton Hall, Lincolnshire, was elected a Governor of the Society.

The following new members were elected:

Goucher, John, Woodsetts, Worksop, Notts
Loveband, Rev. A. W., Yarnescombe, Devon
Duly, John, Northampton
Penoyre, Rev. W. T. Napleton, the Moor, Hereford
Furdon, George, Brampford-Speke, Exeter
Hocking, W., Bude, Cornwall
Hill, Hon. H. Noel, Berrington, Shrewsbury
Cann, W. M., Dawlish, Devon
Mackelcan, G. J., Lechlade, Gloucester
Byers, Frederick C., Exchange Chambers, Plymouth

The names of 9 candidates for election at the next meeting were then read.

Miscellaneous Communications.—Annual Report of Professor Way to the Chemical Committee, of the satisfactory progress of the investigations in his laboratory, and the gratifying fact of a great increase, during the last quarter, in the number of persons interested in agricultural chemistry, who had applied to him for analyses.—Communication from Dr. Royle, of the East India Company, on the sheep of Thibet.—Letter from Mr. Bickford to Mr. Pusey, M.P., on the formation of water-meadows in Devonshire.—Samples of Guernsey butter (of very fine quality) from Mr. Le Beir, secretary to the Agricultural Society in that Island.—Specimens of gutta percha hose for the distribution of liquid manure, from Mr. Beale Browne; and of gutta percha junctions (by means of slide fitting and circular clamp) for such hose, from Mr. Key.—Communication from Colonel E. Napier, on experiments, in which the ultimate decomposition of diseased Potatoes gave rise to the production of winged insects.—Specimens of Indian Corn grown in the United States of America, under latitudes and circumstances favourable for the cultivation of the produce in England, with a practical statement of the management of the Indian Corn crop; from Mr. Pliny Miles.—Schedule form for farm-accounts, from Mr. Popliss.

The Council ordered their thanks for these communications, which they referred to the Journal Committee.

Lecture.—Col. Challoner having alluded to the circumstances which prevented Prof. Way from being able to complete the details of his lecture, announced for Wednesday next, "on variations in the Chemical Composition of Water, as affecting its agricultural uses," informed the Council of the great interest which had been very widely felt among the members who were unfortunately not present at the Professor's important lecture on soils and manure delivered in the Council-room last month, and of the general wish he had heard expressed that an opportunity might, if possible, be afforded them to hear that lecture. He thought, therefore, that Prof. Way would confer an additional obligation on the members if he would kindly consent to repeat the lecture "on the absorptive powers of soil in reference to manure," on Wednesday next, the 15th inst., at 12 o'clock. Mr. Slaney, M.P., seconded the proposition; to which Prof. Way very cheerfully acceded. It was understood that, to this lecture, as to the former, all members of the Society would have the privilege of admission.

Presents.—Mr. Hewitt Davis presented a volume containing his collected communications on farming; Mr. Richard Smith, his treatise on the most profitable system of forming; Mr. Joshua Trimmer, his proposals for a geological survey, specially directed to agricultural objects, illustrated by a coloured sectional chart; Mr. James Matthews presented copies of works published by him—Dixon on Poultry; A. H. B. on the Tree Rose, and Paxton's Cottager's Calendar; M. Yvart, Inspector of the Veterinary and Cattle Schools of France, copies of his work on Merino sheep; transactions were received from the Geological and Statistical Society; proceedings from the Agricultural Society of Paris, and Annual Report from the Guernsey Agricultural Society; the following agricultural journals were also presented by their respective editors; the

Farmer's Magazine, by Mr. Shaw; the Journal of the Chemico-Agricultural Society of Ulster, by Dr. Hodges; Journal and Transactions of the Lower Canada Agricultural Society, by Mr. Evans, and the first number of the Agricultor Espanol, published at Madrid :—for all which the usual thanks of the Council were ordered.

The Council then adjourned (over the day of lecture on the 15th, and the day of general meeting on the 22d) to their weekly meeting on the 29th inst.

Reviews.

Ornamental and Domestic Poultry. By the Rev. Edmund Saul Dixon, M.A., Rector of Intwood-with-Keswick, Norfolk. Published at the Office of the *Gardeners' Chronicle*, 5, Upper Wellington-street, Covent-garden, London.

The really good and agreeable book recently published under this title deserves an especial notice from us, although a large portion of the matter contained in it originally appeared in this publication, and is of course familiar to many of our readers. The simple fact that a large impression of a rather bulky octavo has been already absorbed in the literary market, is an undoubted evidence of the sterling worth of the publication to which our pages have served the office of "a nursing mother."

The origin of the work, as stated by Mr. Dixon, in the preface to the first edition, is as follows. The author having found encyclopædias and current poultry books insufficient to afford him the practical information which he sought when keeping a few fowl, "although totally ignorant of their ways and doings," began to take notes himself of the questions which gave him the most trouble to solve. His friends induced him to offer these notes, with the observations accompanying them, to the Editor of the *Gardeners' Chronicle*, who at once suggested their publication in the *Agricultural Gazette* department, and the result has been that "a class of persons (to quote Mr. Dixon's words), whose good opinion he must think it an honour to have obtained," received them so favourably, that the author ventured to collect his various contributions on a subject which has been deemed so trivial, "that any one claiming to be considered as an educated gentleman may be thought to have done a bold thing in publishing a book on poultry, and giving his real name on the title page." He had experienced something of the sensations of Mr. Mowbray, who only ventured to meet the public criticism under the shelter of an assumed title. The second edition just come forth differs from the first in omitting the original passages from the Greek and Latin authors which had been admitted into it. By the omission of the original passages (the translations being retained), the reader of the new edition gains an accession of new matter to the extent of 50 pages in the mother tongue. Each kind of poultry, as the title intimates, is specially considered, not, however, with the mere routine details of a poultry maid's manual, but with the inquiring mind and critical judgment of an ornithologist familiar with the natural history of the creatures before him, and with the taste and skill of the accomplished gentleman. From so comprehensive a work we can only select a few passages as examples of the quality of the book, and of the manner in which the literary work has been executed. The following are the author's remarks on the classification of fowls:

"It is evident that if domestic fowls be believed to be merely altered forms of one or two wild races, under the influence of altered food and climate, which we have endeavoured to show that they are not, they must be arranged on different principles to what they would be if we allow them to take rank as original and independent varieties or species. In the one case we have to search out the wild bird nearest resembling any one domestic breed, and form our series from that as a beginning as well as we can; in the other case we have to become well acquainted with all the wild and all the domestic species of Gallus, and then arrange them in groups or in a continuous line, according to their resemblances and relationships without any reference to the circumstance of their domestication, or their untameability. The former plan can be carried out by a little theory and bold guess work; the latter requires industry, accurate observation, and opportunities which few individuals, if any, have at present at command. In the meanwhile we may attempt something like an artificial arrangement of fowls, which may afford a temporary assistance to the fancier till a more scientific scheme is worked out, and which may perhaps be the means of leading to it, just as, to compare small things with great, the artificial Linnean arrangement in botany has cleared the way and been preliminary to the great natural system of classification that is now in vogue. Two desiderata are still required for the attainment of this object, one or other of them is indispensable; the first, a complete set of full-sized coloured figures of every variety, giving both the sexes, the egg and the new hatched chick, with accurate and technical descriptions of their plumage and their characteristic properties; the second, a collection of stuffed specimens of the representations of every breed for comparison and reference. The first can only be undertaken by a person of fortune; the second can scarcely be expected from our museum or natural history societies, devoted as they are to subjects of wider range and more general interest. It is to be feared that poultry will be considered beneath the dignity of the Royal Agricultural Society, but such a work, or such a museum, would be no discredit to their taste; and if the ladies of the leading members were to exert their influence, something might perhaps be done to illustrate a tribe of useful and engaging creatures in whom so large a portion of society is more or less interested."

The author, however, despairs of a correct classification by arranging the domestic with the wild races in natural order and sequence, from the deficiency in our present amount of ornithological knowledge, though such a thing may be practicable when the Indian Archipelago, the native country of some of our finest breeds, shall have been more fully explored. Mr. Dixon enters boldly into opposition against the theorists who [maintain that the variety of fowl known by the designation of pheasant bird is a hybrid between the pheasant and the barn-door fowl. This notion] he seems to have successfully combated. He considers the species as distinct, of eastern origin, and maintains that by the immutable law of Nature, a hybrid bird, between the pheasant and common fowl, must be barren. He denies *in toto* the sufficiency of any supposed facts, or the soundness of any facts that have been adduced in support of the contrary opinion, and adds that if this hybrid breed were fertile, it would produce a very defective sort of bird, such as no poultry fancier or poultry butcher would wish to look at. He is able and eloquent on the subject in more than one part of the book, and states as the result of his investigations that hybrids between the pheasant and the fowl are for the most part absolutely sterile; that when they do breed it is not with each other, but with the stock of one of their progenitors, and that the offspring of these either fail or assimilate to one or other original type. No half-bred family is perpetuated; no new breed created by human agency.

Having, with something of the fearless spirit of the game bird, crowed his challenge upon this point, the author passes, by a natural transition, to the natural history and habits of the game fowl, which fight, not like an Irishman, for pleasure and exercise, but because, as a hero of antiquity said on a memorable occasion, "the one will not give way to the other."

This is a very spirited and entertaining chapter. The author defends the game cock from the charge of being a sanguinary tyrant, disposed to provoke the attacks of others. He thinks that the tilting matches of game chickens, which are generally supposed to indicate their pugnacity of disposition, are merely the results of high animal spirits, harmless sports as among the young of many other animals, which snarl, growl, scratch, or thump each other, as the case may be, in high good humour. As to serious cock-fighting, so common in the Indian Archipelago, and so nearly suppressed in this country, Mr. Dixon makes some very rational observations. He has never seen, and probably never will see a cock-fight, and is neither an amateur nor a defender on principle of cock-fighting; but he declares that more cruelty is committed in other matters every day without condemnation. "Cocks must die. Would a cock that had been fought be worse eating than a hare that had been hunted? And as to the mode of death; ask a cock which he would choose—to be hung up by the heels, and have the cook run a knife up his throat, taking care that he bleed long and die slowly (in order that his flesh may be so much the nicer and whiter), or to be set face to face with his adversary and fight for his life. If he win, to be petted and praised; if he fall, to have his existence cut short by one sharp merciful thrust, instead of the lingering faintness of a culinary departure. The combat is a pleasure, the survivorship a fair chance." Other passages, taken almost at random (from a chapter on the Musk Duck), will show the humorous and playful style in which the author so agreeably conveys practical information, and what would be dull parts if detailed by other men. "Can a duck swim?" is a pert question sometimes asked with little expectation of an answer in the negative. Here, however, is a duck, which, if it *can* swim, performs that action in such a clumsy way as hardly to deserve the name of swimming. Those who expect that its singular appearance "would render it a curious, if not an elegant companion, among the more attractive ducks of our aquatic preserves," will be disappointed; for it will never go near the water, if it can help it, but will prefer the farm-yard, the precincts of the kitchen, or even the piggery itself, to the clearest stream that ever flowed. In fact, it hates water, except some dirty puddle to drink and dabble in. When thrown into a pond, it gets out again as fast as it can. It does, indeed, sometimes seem to enjoy an occasional bath, but so does a sparrow or a canary bird. Its very short leg does not appear to be mechanically adapted for the purpose of swimming. It waddles on the surface of a pond, as much as it does on dry land; it is evidently out of its place in either situation. Its proper mode of locomotion is through the air; its congenial haunts are among the branches of the trees.

A pair that were given to me by a friend came home very dirty, and, as at the end of three or four days they still had not washed themselves from their coating of filth, they were driven towards the water, to bathe and be clean. In vain; they flew back over our heads to the poultry-yard, and we were obliged to catch them, to put them into the pond with our hands, and give them a ducking whether they would or not. Another curious fact is, that great part of the feathers of the musk duck do not resist the wet so well as those of other water birds; but the quill feathers particularly, and those of the tail, become soaked and matted in a very few minutes, like those of a hen or turkey; so that if compelled to make any long voyage, at a certain distance they would sink and be suffocated.

The cause of this difference in the wet-repelling powers of the feathers of different birds remains yet to be discovered. The old idea of the function of the oil-gland on the rump needs no further refutation. The quantity of oil secreted is quite insufficient to smear the whole plumage of any bird. The actions of the creature, which are presumed to be the smearing itself with this unguent, are nothing more than the process of combing and pruning and arranging its feathers. The rumpless fowl has a coat just as glossy as any other variety. The necks of some birds, as owls, are too short to reach the gland that is to supply the natural macassar. In other birds, of most aquatic and even oceanic habits, the rump itself is but little developed. What function is performed by these glands remains yet to be demonstrated; probably it will be found to be simply excretory. The question of lubrication might very soon be set at rest by amputating the rump of a common duck or goose, were such cruelty at all justifiable, which it is not, and if, at the end of a month, the mutilated creature swam as buoyantly as ever, it would certainly not be by the assistance of the oil-gland. I venture, therefore, to suggest and claim the credit of first suggesting, that this cause may probably be found in some minute structural peculiarity of the texture of the feather, which the microscope can alone reveal to us. In geology that instrument has afforded great and unexpected assistance. A thin slice of a fossil tree tells us whether it was a Palm, or whether it grew like our Oaks and Beeches; a minute fragment of a tooth has indicated the nature of an extinct and gigantic reptile. Youatt, through its aid, discovered the mechanical cause of the felting property of wool; and it is not too much to hope that it may throw light on the reason why some feathers resist moisture and others do not. *M. D.*

Calendar of Operations.

MAY.

Bedfordshire Farm, *May* 6.—The weather for some time past has been cold and uncongenial for vegetation; but on the other hand, highly favourable for the various operations of the field, in preparing the green crop fallows. We finished planting Mangold Wurzel on the last day of April, and sowed 20 acres in a week. Five pounds of seed were used per acre, and dibbled in at intervals of 27 by 18 inches. All the land was manured in the autumn. Part received another slight dressing of dung again and part was dressed with guano and the superphosphate of lime. Both the guano and the superphosphate were placed under the seed, with a layer of earth between. We have just sown a few acres of Turnips for early consumption. The horses, for some time henceforward, will be employed in carting out the remaining dung in yards to the most distant fields; the various qualities will be thrown up together and well mixed, and afterwards plastered up outside with a puddle of mud prepared from the oozing of the heap. The Turnip fallows are almost ready for sowing, without further preparation. I think I am safe in saying that on 80 acres there is not half a dozen loads of weeds. Every operation of the farm, whether manual or horse labour, stands happily more forward this season than on any previous one. The Rye is now being cut and consumed with a mixture of hay and straw chaff. The cattle are turned out to the fields through the day, but are sheltered and partly fed in the yards at night. The labourers are chiefly employed in hoeing, and turning composts of earth with lime and salt. It is the custom in several parts of this and the adjoining county for labourers to leave off work at 5 o'clock in the afternoon, all summer, save the busiest days of hay and harvest time. Some commence work at 7 o'clock in the morning, and some are allowed an hour for breakfast. In any statistical account of labour such various systems are perhaps deserving of remark. Beer drinking appears to be the greatest social evil of these parts. *R. V.*

Dorset Farm, *May* 6.—Since last report we may say the weather has not been so favourable as we had to report previously; towards the latter end of March it changed from fine dry weather to very cold and wet, and on several occasions we had sharp frosts, but they did not do much harm beyond checking the progress of vegetation, which is now rather backward, and the weather still wet and cold. The early sown Wheat looks very well, but the latter sown and also the Barley look rather yellow; and early Potatoes have been in many cases cut down by the frost since this month came in. We are now busy getting the ground ready for and sowing Mangold Wurzel, which we put in some on the baulk or raised drill system, and some we drill on the flat; the former at 27 inches apart, and the latter at 22 inches. As we have always a good stock of beasts we have plenty of dung, and we are applying it at the rate of from 30 to 40 yards per acre. I think I have stated before that we never fold our sheep on fallow land with hay, but on the young Clovers and other pastures. We folded them on part of a field of Clover, and put dung on the rest at the rate of from 15 to 18 yards per acre, well rotted, and the Grass on both parts is a fair crop, but that where the sheep were folded is decidedly the best, a result that I hardly expected. But I think the fresh urine from the sheep rather than the dung has given the extra stimulus, and circumstances like these ought to teach us (if anything will ever do so), how valuable liquid manure is applied on Grass. I do not think that anything can be found more suitable for dressing pastures. A heavy covering of dung will do some good, but as it is exposed on the surface, if the weather is very drying a great deal must be wasted. When dung is applied to pastures it ought to be mixed for some time with once or twice its bulk of earth, and a little gypsum added would be useful in retaining the chief fertiliser contained in the dung. We shall be employed for the present and part of next week getting in the Mangold Wurzel, and then after them the Swedes. We sowed a piece of Rape about three weeks ago, but the frost has been too sharp for it as it was coming up, and has cut up a great deal of it. *G. S.*

Lammermuir Sheep Farm, *May* 1.—The first fortnight of our lambing season has now passed. It is not often that April exhibits throughout such an almost uninterrupted continuance of dry weather as the one that has now gone. The beginning of it, as well as the greater part of March, having been mild, our hills had put on a somewhat greener hue than is usually the case so early in the season. Such a combination of favourable circumstances do not occur every year, but when they do, generally insure a good supply of milk, and consequently a good crop of lambs. Such, so far as we have gone, is our case, and that of our neighbours generally. Indeed, we understand that throughout the east of Scotland the crop of lambs will be large. About two-thirds of our ewes have lambed, though it will be near a month ere all have finished. In about a fortnight the lambs will be castrated, tailed, and ear-marked. We prefer moist mild weather as most favourable for this operation, having found that during a cold and very dry atmosphere we have a considerable number of deaths, while under the former, few or none. Our corn-sowing was completed on the 13th, and

has now a promising appearance. It has been all rolled since. The Potatoes were planted on the 27th, and we are now busy preparing for Turnip-sowing, which we purpose beginning about the 18th, and finishing during the first week in June—late sown Turnips seldom turning out a good crop in our high district. Cows and young cattle are receiving meadow hay and Oat-straw when in the house. They are let out for a few hours during the day, but the Grass is yet too short to be of much avail to them. The calves are fed on Swedes, Clover, hay, and bruised Oats, besides the usual supply of milk to those that are not weaned. *A Lammermuir Sheep Farmer.*

Notices to Correspondents.

CALVES: *Iman.* Access to salt would be advisable; but the motto, "let well alone," is a very good one, and it will not be advisable to enforce any material alteration in their food before the Grass is ready for them.

FLAX: *A Subscriber.* A rich somewhat adhesive loam is the best. Buy a tract on the subject by T. R. Short. (Groombridge.)

GOLD GRASS: *F.* We presume that what is referred to under this name is Cynosurus cristatus.

KING'S SOMBORNE SCHOOL: *J Galloway.* Groombridge and Sons, Paternoster-row.

MANGOLD WURZEL: *W W D.* The writer has given Mangold Wurzel to milch cows through the winter without any such result as that stated. If given in unlimited quantities, and early in the season, when the root contains a much larger per centage of moisture than subsequently, it may however have the effect of causing abortion. If given raw to young pigs, it has caused inflammation of the bowels. *W. C. S.*

MILK FAILS: *Country Cowkeeper.* Your instructions will be easily enough followed by any tinman. We do not know where the thing ready made is to be had.

PERMANENT PASTURE: *An Old Subscriber.* As you put the case, we should side with you; and *if* you get weather which will let the seed braird, you might sow it in July, after fallowing it this summer.

POULTRY: *Tonbridgiensis* says, "If your correspondent who subscribes himself 'The Son of a Country Rector, Lincolnshire,' would give a detail of his management with respect to poultry by which he nets a profit of 15*s.* by each hen, he would much oblige me, and I doubt not many others."

RURAL CHEMISTRY, by E. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

SMALL FARMS: We have a letter for "The Son of a Country Rector," and would forward it, if we knew how to address it. —*E B P.* "Tough Tom" should be kept where he is for a while, and in the meantime he might be educated for company with his betters. Draining for a year or so previous to trenching would greatly diminish the risk of that process. Fodder from October to June is to be secured by Turnips, Mangold Wurzel, Rye, and Vetches in succession. Gorse, too, will give food through winter. Burnet, Spurry, and so on, are very poor forage crops.

SOOT AND SALT: *Iman.* You may sow it during the present wet weather, as soon as you like after the Clover seed.

SPADE HUSBANDRY: *One who Writes, &c.*, should apply to his bookseller about Dr. Yellowley's pamphlet. We have not a copy, and do not know the publisher. Mr. Yule has lately published a pamphlet on the same subject, by, we think, M'Glashan, Dublin. Mr. Blacker's Essay on Small Farms will be useful.

Markets.

COVENT GARDEN, May 11.

Vegetables are well supplied, but most kinds of winter Fruit are over. Strawberries and Hothouse Grapes are both more plentiful, and the same may be said of Pine-apples, of which some good fruit may be obtained. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. A few bunches of young Carrots and Turnips may be had at from 1*s.* to 2*s.* per bunch; and some green Peas of good quality have been supplied from Cornwall. Frame Potatoes fetch from 1*s.* to 2*s.* per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, and Roses.

FRUITS.

Pine-apples, per lb., 6*s* to 10*s*	Almonds, per peck, 6*s*
Grapes, hothouse, p. lb., 5*s* to 10*s*	— sweet, per lb., 2*s* to 3*s*

SMITHFIELD, Monday, May 6.

The number of Beasts is nearly 1000 less than on Monday last; in consequence there is a little more activity in the trade, and in some few instances 3*s.* 6*d.* is realised for choice Scots. We have a few more Sheep on offer, which causes a dull trade, but quotations remain unaltered. Lambs are with difficulty disposed of at rather less money. From Holland and Germany there are 183 Beasts, 390 Sheep, and 71 Calves; from Scotland, 400 Beasts; and 2200 from Norfolk and Suffolk.

Per st. of 8 lbs.—	*s*	*d*	*s*	*d*	Per st. of 8 lbs.—	*s*	*d*	*s*	*d*

Beasts, 3369; Sheep and Lambs, 24,510; Calves, 149; Pigs, 240.

FRIDAY, May 10.

There is a considerable supply of Beasts; trade is however cheerful, and quotations remain unaltered from Monday. The number of Sheep and Lambs is large; for the former, trade is scarcely so good, and for the latter about the same as on Monday. A choice Calf is pretty readily disposed of, but the general trade is no better. From Germany and Holland there are 126 Beasts, 100 Sheep, and 198 Calves; from Spain, 120 Sheep; from Scotland, 200 Beasts; and 147 Milch Cows from the home counties.

MARK LANE.

MONDAY, MAY 6.—There was a rather larger supply of Wheat from Essex this morning than we have seen of late, but very moderate from Kent and Suffolk; the whole was cleared at an advance of 1*s.* to 2*s.* per qr. A similar improvement was generally insisted upon on foreign, but being unwillingly complied with, sales at this advance were not extensive.—Barley is in better demand, and the turn dearer.—Beans and Peas must each be written 1*s.* per qr. higher.—Oats meet a good inquiry, and realise fully 6*d.* per qr. more money.—Ship Flour commands an advance of 6*d.* per sack.

FRIDAY, MAY 10.—The arrivals of grain of all kinds, both English and foreign, during this week, have been unusually small, This morning's market was attended by some distant buyers for free on board cargoes, and business was done in these to some extent. Transactions in Wheat were limited; by the advance insisted on by holders, nevertheless, in the sales effected an improvement of fully 1*s.* per qr. upon Monday's prices were obtained.—Barley is also 6*d.* to 1*s.* per qr. dearer, but the demand less active.—Egyptian Beans are 1*s.* higher; other sorts fully as dear.—Peas are held for extreme rates.—There is a fair sale for Oats, at fully 6*d.* per qr. advance.—The higher prices asked for Flour restrict the sale, but ship and foreign are each 1*s.* per sack dearer.—Floating cargoes of Galatz Indian Corn arrived off the coast are not obtainable below 30*s.* per qr.

LIVERPOOL, FRIDAY, MAY 10.—At our Corn Exchange this morning rather a large business was transacted in Wheat, but mostly on speculation, at an improvement of 1d. to 2d. per bushel on the price of Tuesday. Flour was 6d. per sack and barrel dearer, but the town dealers supplied themselves only sparingly. Indian Corn also advanced 1*s.* to 1*s.* 3d. per qr.; good American new yellow corn also sold at 30*s.* per 480 lbs. Oats were ½d. per bushel, and Oatmeal 6d. per load higher. A good clearance was made of Beans and Peas at 1*s.* per qr. better prices. Grinding Barley also improved 2d. per bushel.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith, in consequence of the premises being required by the London and Birmingham West-India Dock Junction Railway Company, to sell by Auction, on the premises, Dalston, Middlesex, on MONDAY, May 27, and following day, at 12 o'clock each day, the valuable GREENHOUSE PLANTS, consisting of choice Azalea indica, Erica, Epacris, Boronia, Burchellias, Diosma, Pimelea, Erythrina, Kennedya, Metrosideros, Fabiana, Geraniums, Fuchsias, Verbenas, Chrysanthemums, Lobelias, Calceolarias, Heliotropes, Cupheas, Myrtles, Hydrangea, Alstrœmerias, Cactus, Gardenias, Clianthus, Dahlias, Clematis, Jasmine, Aloes, Brooms, Roses, Magnolia grandiflora, &c.—May be viewed two days prior to the sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises, at the Shop in Covent-garden, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, May 15th, and two following days, at 12 o'clock each day, about 1000 DAHLIAS, consisting of all the leading sorts; the newest varieties of Fuchsias, Verbenas, Heartsease, Geraniums, and other plants in bloom, with a variety of ornamental plants for bedding.—On view the morning of sale. Catalogues had at the Mart, and of the Auctioneers, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, 1 mile from Hyde Park Corner, on THURSDAY, May 16th, 1850, at 12 o'clock, a large assortment of PLANTS for BEDDING OUT, comprising 2000 Geraniums, Fuchsias, Verbenas, &c., in choice variety; also a choice assortment of Pinks, Herbaceous Plants, &c.—May be viewed one day prior to the Sale, and Catalogues had at the usual Seed-shops; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

THE ERECTIONS OF THREE GREENHOUSES, GREENHOUSE PLANTS, &c.

MR. D. A. RAMSAY will sell by Auction, on the Premises, King's Road, Chelsea, opposite Cremorne Gardens, on TUESDAY, May 28, at 12 o'clock, by order of Messrs. Dennis (the lease of the Premises being expired), 3000 GREENHOUSE PLANTS, comprising Camellias, Geraniums, &c., finely in bloom. Also a quantity of Plants for Bedding out, consisting of Geraniums, Verbenas, Petunias, &c., in choice variety. With other Miscellaneous Nursery Stock. May be viewed one day prior to the sale. Catalogues had at the usual Seed Shops, on the Premises, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

TO NURSERYMEN, GARDENERS, CARRIERS, &c.

FOR SALE BY AUCTION, on WEDNESDAY next, at Mr. PAWLEY'S, The White Hart Inn, Bromley, Kent, by order of the Proprietor, who is obliged to clear the ground, that it may be given up, single and pair-horse open and close Vans, some thousand feet of Glass, two Iron Boilers, several hundred feet of Iron Piping, Wirework, large Flowerpots, a splendid Collection of Specimen Plants, &c.—May be viewed any day prior to the Sale, and Catalogues had on the premises, and at the Office of the Country Gentleman, 69, Fleet-street, or at the Office of this Paper.—May 11.

BRIGHTON.—SUPERIOR GRAPERIES, WITH ITALIAN COTTAGE VILLA RESIDENCE.

FREEHOLD FOR SALE.—Nine Forcing Houses in the highest state of culture, and good bearing, to be entered upon forthwith, or at Michaelmas, as may be agreed. The crops succeed each other quickly, beginning in May. The Fruit has maintained a high standing in the London market for 20 years. The Residence has obtained 20*l.* per month. Moiety of purchase on mortgage if desired. This is a rare opportunity of uniting pleasure with profit.—Apply to Mr. J. WEBB, Estate Agent, 65, East-street, Brighton.

SEATON, COAST OF DEVON.

TO BE LET, unfurnished, with immediate possession, by the year, or for a term, the MANOR HOUSE, containing spacious Dining and Drawing-rooms, 10 Bed-rooms, Kitchens, and other offices, with Coach-house, Stables, and Garden; also the right of Shooting over about 700 acres of preserved land. Situated between Lyme and Sidmouth, on a picturesque and healthy part of the south coast of Devon.—To view, apply to Mr. JAMES MAJOR, Seaton; and for further particulars to Mr. BABBAGE, Nettlecomb, near Taunton; or to Mr. JOHN HARE, House-agent, Taunton.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

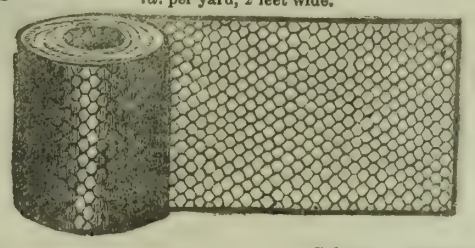
F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.



CORNWALL.

TO BE LET, for 14 or 21 years, from Michaelmas next, Three or Four FARMS, situated in the most fertile district of that county, containing about 200 acres each (to which more may be added) of Arable and Pasture Land, with thriving Orchards. Every information respecting these Farms, which are in a fair state of cultivation, may be obtained by addressing a letter to A. B., Post-office, Bodmin, Cornwall.

N.B. It may be right to add that none but men of skill and capital will be treated with, to whom long terms (at corn rents, if preferred) will be granted.—May 11.

TO GENTLEMEN FARMERS.—If this should meet the eye of any married gentleman largely engaged in farming pursuits, having more house accommodation than he requires, and residing in a part of the country that can boast of a good trout river for fly-fishing, and fair general shooting, and who for society sake might wish to meet with, and to accommodate, a married gentleman, who is an officer in the army, without family, but with one servant, he may do so, by fully entering into particulars upon each point, with L. M. N. R., 10, Charles-street, St. James's-square, London.—Any offer that may appear eligible will be replied to.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London-bridge.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.

2d. It is portable, being packed in rolls, and not liable to damage in carriage.

3d. It effects a saving of half the timber usually required.

4th. It can be easily applied by any unpractised person.

5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.

Price One Penny per Square Foot.

CROGGON and Co.'s. PATENT FELTED SHEATHING for COVERING SHIPS' BOTTOMS, &c., and NON-CONDUCTING FELT for STEAM BOILERS, PIPES, &c., preventing the radiation of Heat, and saving 25 per cent. of Fuel.

Samples, testimonials, and full instructions, on application to CROGGON and Co., 2, Dowgate-hill, London.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

ALEXANDER SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their IMPROVED GRASS CUTTING ROLLING MACHINE for LAWNS, the completeness of which has now been fully proved. The Machine works with perfect ease, producing a beautiful smooth surface, and attended with a saving of labour of 80 per cent.

FROM MR. CHARLES M'INTOSH, CHIEF GARDENER TO HIS GRACE THE DUKE OF BUCCLEUCH, DALKEITH PARK.

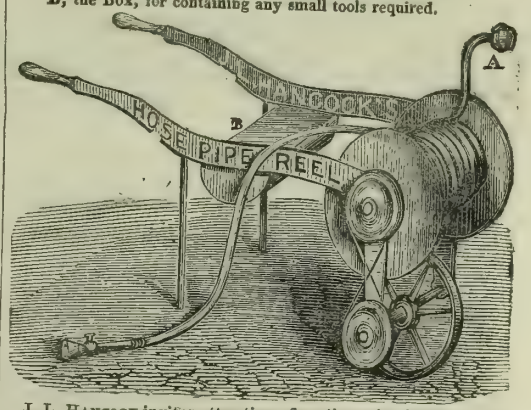
"Dalkeith Park, June 26, 1847.

"Gentlemen,—In reply to yours of the 15th inst., it gives me great pleasure to state that your Grass-Cutting Machine has far exceeded my expectation. We have it in constant use, and find that it does its work most completely. As to the saving of time, it is not easy to calculate accurately; but of this I am satisfied, that the expense of the Machine will be saved in one year in all places of similar extent with the grounds here.—I am, gentlemen, your obedient servant,

"Messrs. Shanks and Son." "CHAS. M'INTOSH."

A. S. and SON respectfully solicit the attention of the Farmers, Agriculturists, and others to an improved STRAW or HAY CUTTING MACHINE, which they have recently invented. The cheapness and utility of this improved Machine, combined with superior workmanship and durability, enable the inventors confidently to recommend it, as the most profitable Machine of the kind yet sent out. Further particulars and a list of prices may be had, by applying to the makers or to their Agents. Agents for London, Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; Hertford, Mr. George Folkard, Ironmonger; Liverpool, Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; Manchester, Messrs. Francis and James Dickson and Co., Seedsmen, 106, Deansgate; Wakefield, Mr. Wm. Barratt, Nursery and Seedsman, St. Johns; Chester, Messrs. F. and J. Dickson, Nursery and Seedsmen; Glasgow, Messrs. Charles D. Young, and Co., 32, St. Enoch-square; Edinburgh, Messrs. Charles D. Young and Co., 48, North Bridge; Perth, Messrs. Dickson and Turnbull, Nursery and Seedsmen.

FLEXIBLE INDIA-RUBBER HOSE PIPES.



JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.

B, the Box, for containing any small tools required.

J. L. HANCOCK invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.

THE GARDENERS' CHRONICLE for Sale, from the commencement in 1841 to the end of 1849, perfect, very clean, and in excellent condition. Price for the set, 8*l.* 8*s.*—Address A.B., Mr. Gaines's Nursery, Battersea, Surrey.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

TO VISITORS FROM THE COUNTRY.—All persons of taste should hasten to inspect the unique and recherché STOCK of ELEGANCIES now exhibited by MECHI in his new Show Rooms, 4, Leadenhall-street, near the India House. Determined to take the lead in taste, he has brought out some most superb and novel specimens in papier maché. Finding it impossible to display them advantageously in his former space, he has fitted up a splendid show room, to which he invites those who are desirous of seeing the most brilliant specimens this country can produce. Some are decorated with admirable copies of Edwin Landseer's most popular paintings, together with some exquisite landscapes of Windsor Castle, Virginia Water, the Isle of Wight, &c. Mechi has the best stock in London of ladies' and gentlemen's dressing cases, work boxes, writing desks, and everything for the toilet and work table.—4, Leadenhall-street. Illustrated Catalogues, gratis.

CHEAP AND EFFECTIVE FENCE AGAINST HARES AND RABBITS.—Iron Wire Netting of various patterns, to exclude the smallest Rabbits, in coils of 50, 100, or any given number of yards, at prices varying from 4*d.* to 1*s.* per yard run. Aviary Net at proportionate prices. None sent out without at least two coats of the best Anti-corrosive Paint. Testimonials of the highest and most respectable character, received during the last 13 years, enable the Advertiser to speak with confidence as to the excellence of the article.—Apply to MR. SAMUEL TAYLOR, Barnwood, near Gloucester; or to ROBERT WOODCOCK, at the Manufactory, Stoke Ferry, Norfolk.

TAYLOR'S BEE-KEEPERS' MANUAL.—Fourth Edition. This day is published, revised, enlarged, and illustrated with nearly 100 engravings, price 4*s.*,

THE BEE-KEEPERS' MANUAL; Or, Practical Hints on the Management and Complete Preservation of THE HONEY BEE. By HENRY TAYLOR.
London: GROOMBRIDGE and SONS, 5, Paternoster-row.

DOMESTIC ECONOMY, SANITARY REFORM, FIRESIDE STORIES, VALUABLE RECIPES, FAMILY SECRETS, COTTAGE GARDENING, &c.

THE FAMILY ECONOMIST contains valuable articles on the above subjects—written in a plain, vigorous style. It is one of the most entertaining and useful periodicals published.

"There are few cheap periodicals which better deserve encouragement than this little work."—*Morning Herald.*

"It is admirably adapted for distribution among the poor, and even the rich might learn a great deal from it."—*Belle Assemblee.*

Price a Penny a Month, a Shilling a Year.

VOLUMES FOR ALL.

THE FAMILY ECONOMIST, Vols. 1 and 2, 1848, 1849. As a present to a servant or poor neighbour, more useful or acceptable Volumes cannot be selected. *Price Eighteenpence Boards, One Shilling Paper Wrapper.* Upwards of SIXTY-FIVE THOUSAND COPIES of the bound Volumes of this work have been sold.

COTTAGE COOKERY, BY ESTHER COPLEY, Author of "Cottage Comforts," &c. Reprinted from the "FAMILY ECONOMIST." Price ONE SHILLING.

GROOMBRIDGE AND SONS, PATERNOSTER-ROW,
And all Booksellers.

NEW WORK ON GARDENING AND BOTANY.
On the 30th ult. was published, price 2*s.* 6*d.*, No. III. of

PAXTON'S FLOWER GARDEN.
Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Wodcuts.
London: BRADBURY and EVANS, 11, Bouverie-street.

CURTIS'S BOTANICAL MAGAZINE.—This, the oldest, and confessedly the best of our botanical periodicals, is now in the 64th year of its existence, without the intermission of a single month. While many rival publications have been discontinued, this still retains its pristine vigour, numbering upwards of 4500 beautiful and accurately coloured Plates. During this lengthened career there have been many fluctuations in the sale of this valuable periodical, and this, with other easily imagined causes, must have left in the hands of the public a great number of incomplete copies of the work, which not unfrequently fall into the hands of parties desirous of rendering them perfect. Under these circumstances the proprietor has thought it desirable to make known to the public generally, that any imperfect copies can be completed, on application by post, or otherwise, to Mr. SAMUEL CURTIS, High-street, Homerton, who will deliver the required Numbers to any part of London.

Also GENERAL INDEX to the first 53 Volumes, with Memoir of the Author.

COMPANION TO THE BOTANICAL MAGAZINE.—This work was published a few years ago, and contains a series of original articles, recording such useful botanical information as was not suited to the pages of the magazine, and is illustrated by 46 Plates and Portraits of eminent collectors of plants. It will be read with pleasure even by those who are not deeply versed in science. It contains, among other papers of great interest, a Journal of an ascent to Adam's Peak, Ceylon; an Account of Mr. Matthews' Journey to the Peruvian Andes; Memoirs and Portraits of the late Messrs. Fraser, Douglas, and Cunningham, &c.
Price, in 2 Vols., 8vo, cloth boards, 25*s.*

DR. S. NEWINGTON'S HAND-DRILL HOES, with their various fittings. With these Hoes a man or lad can hoe from two to three acres of Wheat, Beans, &c., daily, the tines being made with movable shares and adapted either for stirring or hoeing. Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles for all corn, Mangold, Carrots, Turnips, &c. Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red-lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

"FAMILIAR IN THEIR MOUTHS AS HOUSEHOLD WORDS." *Shakespeare.*

Just Published, Gratis, and Post free,

G. WILLIS'S CATALOGUE OF SECOND-HAND BOOKS
ON NATURAL HISTORY,
GARDENING, RURAL ECONOMY, &c.
Containing many choice and Valuable Works, at very low prices, among which are the following, now on sale.

BAXTER'S BRITISH PHÆNOGAMOUS BOTANY; or, Figures and Descriptions of the Genera of British Flowering Plants, with the Scientific and English Names, Indexes, &c. By W. BAXTER, Curator of the Oxford Botanic Garden, WITH 509 COLOURED PLATES, complete in 6 vols. 8vo, cloth, 3*l.* 15*s.* Another set, 6 vols. hf. bd. morocco gilt, top edges gilt, 4*l.* 10*s.* (pub. at 9*l.* unbound), Oxford. 1834–43

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation; being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By CUVIER and LATREILLE. Translated from the last French Edition. With 800 Sheets of Coloured Plates. 8 vols. 8vo, half-morocco, gilt tops, only 3*l.* 10*s.* (pub. at 8*l.* 8*s.*) 1837

*** This celebrated work embraces the whole range of Natural History, and is the only one suitable for a "Home Library." The Plates are engraved upon steel, and nearly all coloured, comprising upwards of 4000 figures of Quadrupeds, Birds, Fishes, Insects, &c.

DON'S GENERAL SYSTEM OF GARDENING AND BOTANY, containing a Description of all Plants hitherto known; their Generic and Specific Characters, place of Growth, Culture, and Uses in Medicine and Domestic Economy, &c., founded upon "Miller's Gardener's Dictionary," and arranged according to the Natural System; *numerous woodcuts*, 4 vols. 4to, cloth, 1*l.* 10*s.* (pub. at 14*l.* 8*s.*) 1831–38

LOUDON'S ARBORETUM ET FRUTICETUM BRITANNICUM; or, the Trees and Shrubs of Britain, Native and Foreign, Hardy and Half-hardy, with their Propagation, Culture, Management, and Uses, *with about 400 plates and upwards of 2500 woodcuts of Trees and Shrubs*, 8 vols. 8vo, *extra cloth*, only 4*l.* 4*s.* (pub. at 10*l.*) 1838

REPTON'S WORKS ON LANDSCAPE GARDENING and LANDSCAPE ARCHITECTURE, new edition, with large Additions, by J. C. Loudon, illustrated by 250 engravings, thick 8vo, cloth, ONLY 14*s.* (pub. at 1*l.* 10*s.*) 1840

THE FARMERS' LIBRARY, containing the last revised editions of the celebrated Treatises on the Horse, the Dog, the Ox, Sheep, the Hog, Poultry, and Bees. By YOUATT and MARTIN. *Illustrated by 400 Woodcuts.* The whole bound in two large volumes, royal 8vo, ONLY 18*s.* (pub. at 1*l.* 15*s.*)
C. Knight, 1849

This most valuable work was published under the superintendence of the Useful Knowledge Society, and comprises the best and latest treatises on each subject.

WOOD'S INDEX ENTOMOLOGICUS; or a complete Illustrated Catalogue of the Lepidopterous Insects of Great Britain, *comprising 1944 Figures of Butterflies and Moths, beautifully engraved* and MOST CAREFULLY COLOURED, 8vo, *new cloth*, 3*l.* 10*s.* (pub. at 8*l.* 8*s.*) 1845

This is by far the most complete illustrated work on British Entomology, and is especially adapted for those forming collections, as it comprises Figures and Descriptions of every known species of Butterflies and Moths.

GEORGE WILLIS, Great Piazza, Covent-garden, London.

Just published, by the Author, JAMES JOSEPH NOLAN, 33, Bachelor's-walk, Dublin,

BRITISH WILD FLOWERS. In Sixty Plates, containing Three Hundred and Fifty Species, beautifully coloured. Demy 4to, cloth, lettered, 2*l.* 2*s.*; half-bound, morocco, gilt edges, 2*l.* 10*s.*
London: WM. S. ORR and Co., Amen Corner.

COMPANION VOLUME TO HUMBOLDT'S COSMOS. A Comprehensive Atlas of Physical Geography. Constructed by A. PETERMANN, F.R.G.S., with descriptive Letterpress, embracing a general view of the Physical Phenomena of the Globe, by the Rev. T. MILNER, M.A., author of the "Gallery of Nature," &c. One vol., imperial 4to, cloth, 21*s.*
London: WM. S. ORR and Co., Amen-corner.

LOUDON'S HORTICULTURIST. The Culture and Management of the Kitchen, Fruit, and Forcing Garden explained to those having no previous knowledge in those departments. By J. C. LOUDON, F.L.S., H.S., &c. In one vol., 8vo, cloth, 15*s.*
London: WM. S. ORR and Co., Amen-corner.

In Weekly Numbers, price 2*d.*, Stamped 3*d.*, Monthly Parts (Five Numbers), 11*d.*,

THE COTTAGE GARDENER; or, a Practical Guide in every department of Horticulture, and Rural and Domestic Economy. Conducted by GEORGE W. JOHNSON, Esq., Editor of the "Gardener's Almanack," "Modern Gardener's Dictionary," &c.; and assisted by a staff of able contributors.
A New Volume, with new features, has just commenced.
WM. S. ORR and Co., Amen-corner, London.

METEOROLOGY.—Just published, price 1*s.*,

A MANUAL OF THE THERMOMETER AND CLIMATE OF ENGLAND.
By JOHN HENRY BELVILLE, of the Royal Observatory.

Also, by the same Author.

A MANUAL OF THE BAROMETER. Second Edition, price 1*s.*
London: R. and J. E. TAYLOR, Red-lion-court, Fleet-street.

Post 8vo, 7*s.* 6*d.* cloth,

A HANDBOOK OF FIELD BOTANY, comprising the Flowering Plants and Ferns indigenous to the British Isles—arranged according to the Natural System. The Orders, Genera, and Species carefully analysed, so as to facilitate their discrimination. With a Synoptical Table of the Genera, according to the Linnæan classification, and a Glossary of those terms most commonly in use.
By WM. STEELE, A.B., M.B., T.C.D., &c.

"Here is another of those useful manuals which enable the student of British Botany to ascertain the names of plants without difficulty. The arrangement is clear, and the distribution of the type, though novel, like Roemer's Synopsis, is, nevertheless, such as to catch the eye readily when once familiar with it. The book will be a very useful travelling companion."—*Professor Lindley's Gardeners' Chronicle.*

Dublin: JAMES M'GLASHAN, 21, D'Olier-street. London: WM. S. ORR and Co. Sold by all booksellers.

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. ROYAL BOTANIC SOCIETY, REGENT'S PARK. GENERAL EXHIBITIONS of FLOWERS AND FRUIT on WEDNESDAYS, JUNE 12th and JULY 3d. AMERICAN PLANTS on SATURDAYS, MAY 25th and JUNE 1st.

Tickets to be obtained at the Gardens, only by orders from Fellows of the Society, price 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each. Each ticket will admit one person on any one of the above-named four days to the Collection of American Plants, on any one day from the 3d to the 8th of June, both included.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, under the patronage of her Most Gracious Majesty the QUEEN.

The SECOND EXHIBITION of the season will be held at the Royal Surrey Zoological Gardens, on WEDNESDAY, MAY 22d (open to all exhibitors), when Prizes will be awarded for the following productions, viz., for Miscellaneous, Orchids, and Specimen Plants; Pelargoniums, Cape Heaths, Azaleas, Tulips, Heartsease, and Vegetables. In addition to the prizes offered by the Society, Mr. R. J. Lawrence, of Hampton, offers 5*l.* value of Tulips, selected from his bed when in bloom, for the 1st and 2d Prizes to Amateurs. The following Exhibitions will also take place at the Royal Surrey Zoological Gardens, on Wednesday, June 19th; Tuesday, July 23d; and Wednesday, September 4th. Lists of Prizes, and the Rules for Exhibition, may be obtained from JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

STAR NURSERY, SLOUGH, BUCKS.

W. R. BRAGG begs to inform the Floral Public that his Annual Spring Catalogue contains Descriptive Lists of E. Foster's new and superlative Pelargoniums; the best varieties of Pinks, Picotees, Carnations, Pansies, Roses, &c., and may be had on application.

GIPSY PRIDE, by far the most successful Pelargonium of 1849, may still be had; also Constance, Conspicuum, Narcissus, Armida improved, and all the best show varieties of last and former years, in extra strong plants.

NEW PANSY, HUNT'S "HELEN," has gained more first class certificates in 1849 than any other variety now offered, and, beyond doubt, is quite a leading white-ground flower; plants are fine and healthy. 5*s.* each.

GOLDEN YELLOW DAHLIA, OLIVER'S "GOLDEN DROP," gained four first prizes and first class certificates in 1848, &c., five of each in 1849. Plants in May, 10*s.* 6*d.*

NEW FANCY DAHLIA, BRAGG'S "LADY GRENVILLE," the most successful fancy Dahlia of the year; colour, deep red, distinctly tipped with white; as a guarantee for constancy, it has received 11 first class certificates, four extra money prizes, and two premier prizes in class showing. Plants in May, 10*s.* 6*d.* Sound ground and pot roots of all the best Fancy and other Dahlias, at moderate prices.—May 18.

NEW DARK FUCHSIA—"SIR J. FALSTAFF," 10*s.* 6*d.* per plant, one over when two are ordered. Strong plants of the above on application to C. TURNER, Royal Nursery, Slough, Bucks.

SELECT SELECTIONS OF PLANTS.

HART AND NICKLIN, FLORISTS, Guildford, offer healthy plants of the following.

FUCHSIAS.—Alboni, Purity, Flavescens, Gem of the West, Splendida, Elegantissima, Criterion, Dr. Smith, Esteem, Ne plus Ultra, Corallina, Williamsii, Etiole de Versailles, Purpurea elegans, 8*s.* per doz., free by post.

VERBENAS.—General Cavaignac, Avalanche, Bride, Reine de jour, Eclipse, John Salter, Brilliant, Princess Alice, Lord of the Isles, Gem of the West, Eyebright, Cardinal, Duchess of Northumberland, Valentine de Saveuse, La Villegeoise, Orpha, Viscount de Sourval, Heloise, Vulcan Superb, Lady of the Lake, Morphe, Tommy, Royal Purple, 12*s.* per doz., purchaser's selection.

GERANIUM—Queen of Summer, 2*s.* 6*d.* each.

Geraniums, Petunias, Phlox, Anagallis, Heliotrope, &c., 4*s.* per doz.

Packages free on South-Western or Eastern Railways.

IMPORTANT TO HORTICULTURISTS. — All question of doubt is satisfactorily removed as to the utility of ROBERTS'S STRAWBERRY TILES, by the following testimonial, extracted from a letter dated the 11th inst.:—

"Sir,—Will you be good enough to forward, per first goods train, five pounds' worth of your Strawberry Tiles. I think this order will convince you of the high estimation in which your Tiles are held by me. I now think them an indispensable article in a garden; for, with them, I can depend on a first-rate crop, and every berry in the greatest perfection, which I could not say before I had the assistance of your Tiles; and if Gentlemen and Ladies were aware of half the dirt they eat in using Strawberries grown without the Tiles, I am certain that alone would bring their use into every garden. But that is not all; their use lessens the labour of watering, which is a great thing indeed where few hands are employed. (Signed) D. JOHNS, Gardener to Charles Hoare, Esq., Luscombe Gardens, Dawlish, Devon."—N.B. The writer of the above had upwards of 1000 of the Tiles last year.

An Illustrated Pamphlet can be had for three postage stamps, on application to Mr. JOHN ROBERTS, 34, Eastcheap, London.

FOR SALE, ENTIRE, OR IN ALLOTMENTS.—COFFEE ESTATE ON THE NILGHERRIES, PRESIDENCY OF MADRAS.

"Carry the plantation to the Cooly, instead of the Cooly to the plantation."—LORD JOHN RUSSELL'S *Speech on Cooly Immigration to the West Indies.*

A COFFEE PLANTATION at Walaghat, Koondah Mountains, near Ootacamund, Nilgherrie Hills, consisting of 400 cawnies (about 500 acres), deep soil of disintegrated granite and vegetable matter; 105 acres have been felled and cleared, 65 acres are planted with Coffee, of which 57 acres will be in bearing in 1851. The forest consists of trees growing close together, perfectly straight, of great girth and upwards of 40 yards in height. The elevation is 4000 feet above the sea, the climate is rainy, and the thermometer ranges between 60° and 75°, Fahr., in the shade. There are two large streams, with water to drive machinery all the year round. There is a furnished Dwelling-house, walls of granite 3 feet thick, and 52 feet in length by 24 feet; a range of Out-houses, Cooly Houses, extensive Nurseries, containing several hundred thousand Plants ready for transplanting, Tools, &c., and abundance of Building Material. There are Grape Plants for a small Vineyard, and a young Orchard of Mulberries, Peaches, Bananas, Plantains, Pines, Oranges, Sugar-cane, &c. The Estate is 5 miles from the bottom of the Ghaut, 16 miles from Edduana, whence there is water carriage to Calicut. The public road runs through the Estate, the land is sheltered by high mountains; labour is abundant at 4 rupees (8*s.*) per month. The purchaser will hold the land free for 30 years; after which it will be subject to the ordinary land-tax, on condition of bringing the one-half of the forest land into cultivation within 13 years. —Apply to H. HUTSON, Esq., at Dr. F. Farre's, 35, New Bridge-street, London; or to H. V. CONOLLY, Esq., Collector of Malabar; or to W. H. STAINBANK, Esq., proprietor of an adjoining plantation; and, for reference, to RICHARD OWEN, Esq., F.R.S., 42, Lincoln's-inn-fields; or MESSRS. STAINBANK, 147, Leadenhall-street, London.

VALUABLE HARDY CONIFERÆ.— This being the best season for planting out these important Ornamental Trees, the following are offered as some of the most desirable of the hardy species. They are especially recommended as being all RAISED FROM SEEDS, none being either grafted or cutting plants. Many other species besides those enumerated may be obtained.

ROBERT GLENDINNING, Chiswick Nursery, near London.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

YELLOW GLOBE MANGOLD WURZEL SEED, of 1849, warranted true.—A Ton weight, or Sacks of 1 cwt., may be had of MESSRS. JEYES and Co., Northampton, at 30*s.* per 112 lbs.

ESCALLONIA MACRANTHA.—LARGE RED-FLOWERING EVERGREEN ESCALLONIA.

MESSRS. VEITCH AND SON have much pleasure in calling attention to the above beautiful Escallonia (figured in Curtis's Botanical Magazine for October 1849, and therein described as "assuredly the handsomest of all the known species.") It has proved a perfectly hardy evergreen Shrub, having stood in the open border during the last severe winter, free from injury, without any protection whatever. The foliage is a dark glossy green, habit compact and good, and an abundant bloomer through the summer and autumn; it is altogether a very fine plant, and one they can confidently recommend. Fine well-established plants on and after the 1st of June at 21*s.* each; one plant over to the trade on every three taken. A coloured Plate and letter-press description may be had (postage free) on application enclosing six postage stamps.

Also ready, on and after the 1st of June, the following new and desirable plants, viz., OXALIS ELEGANS, Elegant Wood-Sorrel from Peru.—This beautiful Oxalis, figured and described in Paxton's Magazine of Gardening for October 1849, also in Curtis's Botanical Magazine for January last, was exhibited and received a medal at the London Horticultural Society's meeting in Regent-street, July 1848. It has stood three winters uninjured, without shelter, in the open border, and may therefore be considered a hardy plant. It is an abundant bloomer, flowering from June till November, and a very desirable and showy plant for the flower-garden. Good established plants 5*s.* each, or six plants to the trade for 21*s.*

CALCEOLARIA GRANDIS.—A dwarf, compact, evergreen, shrubby, Peruvian species, with green glossy foliage, and an abundant bloomer; exhibited at Chiswick, May 1849, when the large silver medal was awarded it. Good established plants 5*s.* each, or six plants to the trade for 21*s.*—Exeter, May 18.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.

MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21*s.* each.—Bagshot Nursery, Surrey.

EXOTIC AND INDIGENOUS FERN SEEDS.

WILLIAM MAY, F.H.S., begs to announce to the admirers of this interesting group of Plants, that he has been presented with a Collection of Seeds from one of the most celebrated growers in this country, consisting of 60 distinct species and varieties, which will be sent, post free, on receipt of 20*s.*—The Hope Nurseries, Bedale, Yorkshire, May 18.

ACHIMENES TUGWELLIANA.—This beautiful Achimenes was raised by Mr. Carmichael, gardener to G. C. Tugwell, Esq., Crowe Hall, Bath. It was the admiration of all who saw it in bloom, and the following opinions were expressed upon its merits:

"ACHIMENES: *W. C.* Your hybrid between A. patens and A. longiflora, with deep violet-purple flowers, about the size of those of A. patens, is a decided cross, and is a very beautiful thing, nice in colour."—*Gardeners' Chronicle*, August 11, 1849.

"ACHIMENES: *William Carmichael.* Your hybrid between A. patens and A. longiflora is distinct from both the flowers, being about the size of A. longiflora, with a colour intermediate betwixt the parents. It is undoubtedly a desirable acquisition to this already useful and ornamental class of plants."—Gardeners' Journal, August 18, 1849.

R. GLENDINNING possessing the whole stock of the above desirable Achimenes, will be prepared to send out good plants the first week in June, at 7*s.* 6*d.* each. For every three ordered one extra will be added.—Chiswick Nursery, near London.

AZALEA INDICA.—This splendid tribe of Plants is now in FULL BLOOM at MESSRS. LANE and SON'S Nurseries, Great Berkhamstead, which are only a short distance from the Station on the London and North-Western Railway. A visit would amply repay all those interested in these plants, the mass of bloom being beyond description,

THE NEWEST AND MOST BEAUTIFUL PLANTS FOR BEDDING OUT can now be supplied by YOUELL and Co., comprising the most distinct and striking varieties of recent introduction, at 4*s.*, 6*s.*, 9*s.*, and 12*s.* per doz., viz, Fuchsias, Verbenas, Petunias, Antirrhinums, Anagallis, Bouvardias, Calceolarias, Chrysanthemums, Cupheas, Carnations, Geraniums (scarlet and fancy kinds), Heliotropes, Lantanas, Lobelias, Lychnis, Mesembryanthemums, Nemophila maculata, Pansies, Pentstemons, Phloxes, Salvias, Double White Rockets, Zauschneria, &c., of which Catalogues can be had on application.—Royal Nursery, Great Yarmouth.

EDWARD GEORGE HENDERSON, Wellington Nursery, St. John's Wood, London, begs to offer the following New and Select Plants:

Scarlet Geranium, "Commander-in-Chief" ... 10*s.* 6*d.*
,, ,, "Excellence" 7 6
Allowance, on each, to the Trade, if three are taken.

NEW FUCHSIAS (Henderson's).

Prince of Orange, Fair Rosamond, Don Giovanni, Sims Reeves, Pearl of England, Grand Master, and Confidence. The set of seven for 30*s.*, with the usual discount to the Trade.

R. MARNOCK.

NEW BLUE VERBENA—"MRS. MILLS," with white centre, of the finest shape and habit; equally adapted for bedding or pot culture, warranted much the best of its class.

C. TURNER has some strong plants left of the above at 5s. each, one plant over for every two ordered.—Royal Nursery, Slough.

HOME GROWN SEEDS, CARRIAGE FREE BY GREAT WESTERN, SOUTH WESTERN, OR SOUTH EASTERN RAILWAYS.

	per lb.	per gal.
THE ASHCROFT SWEDE TURNIP.—This is decidedly the best of all Swedes; it is very large and better shaped than the Liverpool Swede, which it somewhat resembles; it is perfectly hardy, and being of quick and strong growth it is so soon in rough leaf as to be much less subject to suffer from attacks of the fly. The colour is yellow, with purple top	1s 0d	6s 0d
EARLY SIX WEEKS TURNIP.—An excellent sort for early sowing to feed off for Wheat. *A Field of these Turnips grown (from Messrs. Sutton's Seed) by Mr. E. W. Moore, at Coleshill, gained the 20l. prize at the Farringdon Agricultural Show in December last*	1 0	6 0
SUTTON'S PURPLE-TOP YELLOW HYBRID.—*This sort is equal to a fine yellow Swede, may be sown much later, and keeps well till spring*	1 0	6 0
DALE'S HYBRID.—A fine green-top Turnip ...	0 10	4 6
YELLOW TANKARD.—Very excellent ...	0 11	5 0
LINCOLNSHIRE RED.—*The original stock of this superior New Turnip was presented to J. S. and Sons by Philip Pusey, Esq., M.P.*	1 0	6 0

Liverpool Swedes, Laing's, Matson's, Fettercairn, and other Swedes. Fine Green-round, Globe, Tankards, and other Turnips, true stocks of home growth, 20s. to 30s. per bushel (as see Sutton's Agricultural Seed Catalogue). True Italian Rye Grass, 6s. 6d. per bushel. Fresh imported Lucerne, 80s. per cwt. White Mustard Seed, 10s. per bushel. French Furze, 1s. per lb., and all other Agricultural Seeds at lowest market prices.

JOHN SUTTON and SONS, Nos. 7 and 8, Market-place, Reading, Berks, confidently recommend the above articles as being of very superior quality; *they beg also to refer to their Advertisement which appeared on the last page of the Gardeners' Chronicle on the 30th of March*, by which it will be seen that they supply GRASS SEEDS FOR PERMANENT PASTURE, either separate or mixed, AT MUCH LOWER PRICES than those usually charged. *Carriage free, as see above.*

VERBENAS. †

Twelve of the following, all new varieties of last season, 12s.: Barker's Cardinal,* Junius,* Eyebright, Duchess of Northumberland, Miss Thorold,* and Lord of the Isles; Wyness' Princess Alice;* Smith's Napier, Burgundy, Psyche,* War Eagle,* Lady Russell, and Queen of the French; Epps' Eclipse* and Eppsii;* Ivery's Union Jack* and Attraction; Chauviere's John Salter, General Lamoriciere, Chauverii,* Rosati, and Madame Ravershon; Dufoy's Apollon* and Morphee;* Young's Royal Purple and Brilliant: Barnes' Queen of Summer;* and Joiris' La Candeur.

12 fine showy varieties	4s. 0d	12 superior varieties ...	7s. 6d
25 do. do. ...	7 6	25 do. do. ...	12 0

Fifty varieties, in choice assortment, 20s. Those of the above Verbenas marked thus (*) are best adapted for bedding, being of good habit, and of bright showy colours, and can be had by the dozen, or half-dozen of each sort, at 9s. per dozen, with the following at 6s.; not less than six of each:

Robinson's Defiance	Barker's St. Margaret
Ivery's Emperor of China	White Perfection
Englefieldiana	Amulet (lilac).

DAHLIAS.

12 superior vars. of 1849	21s. 0d	12 fancy vars. of 1849 ...	18s. 0d
12 fine varieties ...	5 0	12 fine fancy vars. ...	5 0
25 ditto	10 0	12 superior ditto ...	9 0
12 superior ditto ...	9 0	50 vars., including new	42 0

CHRYSANTHEMUMS. †

12 fine varieties ...	6s. 0d	12 superior varieties ...	9s. 0d
25 do.	10 6	25 do. do. ...	17 6

Forty varieties, in choice assortment, 30s.

GREENHOUSE PLANTS.

12 fine showy varieties	15s. 0d	12 extra choice varieties	25s. 0d
25 do. do. ...	28 0	50 fine varieties... ...	50 0

Greenhouse Climbing Plants, 12 select varieties, 12s.
Stove Plants, 12 fine and select varieties, 18s.
†Achimenes, 6 splendid new varieties, 7s. 6d.
,, 12 fine and select varieties, 6s.
Gloxinias, 12 varieties, 15s.; 6 superior new varieties, 9s.
Azalea indica, 12 fine varieties, 16s.; 6 superior do., 10s.
Cinerarias, 12 fine named varieties for 10s.
Hardy Herbaceous Plants, 100 showy varieties, 30s.; 50 do., 18s.; 25 do., 10s.; 100 superior, 50s.; 50 do., 32s.; 25 do., 17s. 6d.
Hardy Rock Plants, 25 varieties, 12s.; 12 do., 7s. 6d.
†Phlox, 12 fine varieties, 6s.; 12 superior do., 9s.
Antirrhinume, 12 fine varieties, 6s.; 12 superior do., 10s.
Roses, 12 fine autumnal blooming varieties, in pots, 12s.

NEW PLANTS, strong and well established.

Gloxinia Grandis, each,	5s. 0d	Liebegia speciosa, each,	3s. 6d
,, Wortleyana...	2 6	Luculia Pinciana ...	2 6
Geranium Magnificent	21 0	Tritonia aurea, 3s. 6d. to	7 6

Æschynanthus speciosus	3 6	2s. 6d. to	3 6
Indigofera decora ...	3 6	Fuchsia corymbiflora	
Verbena Magnificent †...	2 6	alba †	3 6

CHOICE SEEDLING PETUNIAS.†

Magnificent	Orion	Cassandra
Castor	Pollux	Syren

For description see *Gardeners' Chronicle*, April 14, 20, and 27.
The set 22s. 6d.; usual allowance to the Trade.
Those marked † can be sent free by post if required.
Goods sent carriage free to London, and with all orders of 40s. and upwards extra plants presented. Remittances requested from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or STEPHEN BROWN.
Seed and Horticultural Establishment, Sudbury, Suffolk.

MR. GLENNY REQUESTS that all Communications to him upon the subject of Sales, Valuations, attendance as Judge, or respecting the "Country Gentleman," Cottage, Villa, Farm, and Garden Newspaper, may be addressed 420, Strand, or "Scottish Agriculturist's Journal" Office, St. Andrew-street, Edinburgh.

TO EMIGRANTS.

FORTY ACRES of LAND (five acres broken up, fenced, and sown), a good substantial LOG HOUSE, and a free passage to any balloted family of the POTTER'S JOINT STOCK EMIGRATION SOCIETY AND SAVINGS' FUND, enrolled under Act of Parliament. Contributions—Three pence per week; every 1l. 1s. 6d. constituting a Share, and giving the right to ballot. Open to men of all trades. One Estate of 1600 Acres, called Potterville, already peopled; and FIFTY THOUSAND ACRES now in course of peopling. The latter is called Emancipation Ferry, is situate on the Fox River, near Fort Winnebago, in the state of Wisconsin, United States, North America, and has received Six Hundred Families in the course of the last eighteen months.—For particulars apply to the Agent and Founder, Mr. WILLIAM EVANS, Examiner Office, Shelton, Staffordshire Potteries.

Protection to Emigrants and Passage arranged at the Shipping Office of the Society's Agent, WILLIAM EVANS, 104, Dale-street, Liverpool.

ZOOLOGICAL GARDENS, REGENT'S PARK.—Admission every day in WHITSUN WEEK, except Saturday, at SIXPENCE each person.

DANECROFT NURSERY, STOWMARKET, SUFFOLK.—All Persons who claim any Debts against the Estate and Effects of the late Mr. SAMUEL GIRLING, Florist and Nurseryman, deceased, who have not received a Dividend upon the amount thereof, are requested immediately to apply for the payment of the Dividend to me, at Peasenhall, near Yoxford, that the final Dividend may shortly be made.—WILLIAM GIRLING, Peasenhall, May 18.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Those in bloom will be exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong blooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

HOLLYHOCK SEED.

J. KITLEY begs to inform the Admirers of the HOLLYHOCK, that he has a small quantity of SEED saved from very choice double varieties of all colours, a packet of which will be sent post free, on the receipt of postage stamps to the amount of 2*s.* 6*d.*, or in 18 named varieties, for 5*s.*—Lyncombe Vale Nursery, Bath, May 18.

EDWARD DENYER having the entire Stock of a very brilliant SCARLET GERANIUM, named "ADMIRAL VON TROMP," recommends it with the greatest confidence to his kind Patrons, feeling assured that it will give entire satisfaction, as it is one of the most profuse bloomers known; in growth, the habit of Tom Thumb. E. D. has much pleasure in offering the above at 18*s.* per dozen, or 2*s.* each; good Plants in pots are now ready.

E. D. begs to inform the Lovers of ROSES that they are now in full bloom, in pots, in the Rose-house, and solicits his Friends' inspection of them. E. D. has been successful in raising large quantities of Geraniums, Verbenas, Calceolarias, &c., for turning out into the flower-borders, at 4*s.* per dozen; extra large size, 6*s.* E. D. informs his Friends that he has no Seed Shop in London.—Catalogues to be had on application at the Nurseries, Loughborough-road, Brixton, near London.

RENDLE'S PRICED CATALOGUE OF PLANTS IS JUST PUBLISHED, and can be had for one postage stamp.

Ever since our invention of the "Tank System of Heating Horticultural Buildings" (for which a Gold Medal was unanimously awarded to us by the Royal Devon and Cornwall Horticultural Society) we have been enabled to propagate plants in such abundance, with scarcely a failure, that we are enabled to offer them at

VERY REDUCED PRICES.

We shall have at least THREE THOUSAND DAHLIAS and FUCHSIAS ready for delivery after the 10th of May next, as well as a large quantity of Geraniums, Camellias, Indian Azaleas, Cinerarias, Verbenas, Antirrhinums, Chrysanthemums, with a large collection of Greenhouse, Hothouse, and Herbaceous plants, prices of which will be found in our new Catalogue, on application to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth. ESTABLISHED 1786.

DAHLIAS.—Magnificent (Keynes'), 10*s.* 6*d.*, 9 certificates; Sir F. Bathurst (Keynes'), 10*s.* 6*d.*, 9 certificates; Snowflake (Dodd's), 10*s.* 6*d.*, 5 certificates; Queen of Primroses (Keynes'), 10*s.* 6*d.*, 5 certificates; Gaiety (Dodd's), 7*s.* 6*d.*, 4 certificates; Elizabeth Proctor's Fancy, 10*s.* 6*d.*, 7 certificates; Highland Chief, 7*s.* 6*d.*, 5 certificates; Flying Dutchman, 7*s.* 6*d.*, 5 certificates; Forget-me-not (Hooper's), 7*s.* 6*d.*, with all the leading show flowers of the season, are now ready for sending out, in extra fine plants, on application to JOHN KEYNES, Castle-street Nursery, Salisbury.—May 18.

CHEAP BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, will send out the following Bedding Geraniums, 3*s.* 6*d.* per dozen; all other kinds of Bedding Plants, 2*s.* 6*d.* per dozen. Geraniums sent out of pots, 2*s.* 9*d.* per dozen; all other kinds, 1*s.* 8*d.* out of pots. Descriptive Catalogues sent on the receipt of 1*d.* postage stamp.

FARNHAM CASTLE CUCUMBER.—Two Seeds of this stout Black Spine Cucumber will be sent, on the receipt of 12 postage stamps. May be grown 24 inches long. Twelve seeds of Prize-fighter, ditto, for 12 stamps.—May 18.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

HORTICULTURAL TOOLS.

GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Shears, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

MEETINGS AT WORTON COTTAGE.—The Censors of the "Florist and Garden Miscellany" inform raisers that there will be no Meeting on Wednesday next, the 22d inst., on account of the Royal South London Exhibition falling on that day. Flowers meanwhile may be forwarded, addressed to Mr. BECK, Worton Cottage, Isleworth, Middlesex.

HARDY AND SON, SEED GROWERS, Maldon, Essex, beg to offer, during this and next months, strong plants of the HERACLEUM GIGANTEUM, free by post, at 9*d.* each, or a packet of Seed for autumn sowing, 1*s.* Remittances requested.

In describing it, Mrs. Loudon, in the "Ladies' Companion," p. 141, observes—"It is one of the most magnificent plants in the world, growing 14 feet high, having a handsome fluted stem, 6 or 8 inches in diameter, with compound umbels of white flowers 12 feet in circumference, and leaves equally enormous, from 5 to 7 feet wide."

In the last number of the Journal of the Horticultural Society, Mr. Thomas Moore, F.B.S., Curator of the Chelsea Botanic Garden, speaks highly of it as an ornamental umbelliferous plant, of immense magnitude, appropriate to such situations as the bold openings of rude or wilderness scenery, &c.

The Gardeners' Chronicle.

SATURDAY, MAY 18, 1850.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	May	20	Chemical	8 P.M.
			Pathological	8 P.M.

			Philological (ditto)	8 P.M.
			Royal Institution	8½ P.M.
SATURDAY,	—	25	Royal Botanic Gardens (American Plant Show)	2 P.M.

COUNTRY SHOWS.—Tuesday, May 21: Derby Midland Horticultural.—Wednesday, May 22: York Horticultural.—Thursday, May 23: Royal Oxfordshire Horticultural, Liverpool Horticultural, and Bath Horticultural.

IT is difficult for those who have not read the late report upon the BRITISH MUSEUM to appreciate correctly the patience, industry, and skill with which the Royal Commissioners searched into the recesses of that monument raised to the genius of English maladministration. From witnesses, of some of whom the most favourable character would be that they were self-contradictory, absurd, or unwilling, has been elicited 1500 or 1600 folio pages of invaluable evidence, concerning a multitude of important facts, to which the commissioners did not think it necessary to make special reference in their report. Of this evidence more than half is already in the possession of the public, and the remainder will appear as soon as the index-maker shall have awakened from his slumbers. The story that it already tells us is far worse than even we, who live almost in the atmosphere of Russell-square, could have anticipated. A Board of Trustees, whose very number renders them powerless for good, presides over the national treasury of antiquities, literature, and natural science. A corps of principal officers, some of whom are men of high ability, others of no ability at all; none under efficient control, each claiming independent authority, and exercising it if he can—squabbling and quarrelling about rooms, and keys, and trumpery rights; now setting up a sort of pretence that they hold patent offices, and then asserting their immovability, snapping their fingers at trustees, Treasury, Parliament, and public opinion—form the staff to which the working of the Museum is confided. A straggling throng of ill-paid assistants, in some cases far superior to their officers in talent, industry, and personal acquirements, but possessing no more claim to the attention of the trustees than the menials who sweep the rooms, bring up the rear of the motley force. These facts are sufficiently indicated by the evidence itself, independently of the authentic rumours which are current in society. We quite agree with the commissioners that, for such a state of things, there is but one remedy—that of entrusting the executive management of the Museum to a small board of responsible officers, some of whom at least should be paid. To this, or something like it, the matter must come at last; and whenever that does happen, we venture to believe that one of the earliest measures will be the removal of the herbarium and its accompaniments to Kew. Room is already wanted for departments of natural history, better suited to such a place as London. Mr. ROBERT BROWN complains that he could not do what he wanted to do because he could not get a room (qu. 8343). But Mr. GRAY thinks that one of the rooms Mr. BROWN at first possessed might have done very well (qu. 3482); and hints pretty plainly that, the room in question, taken from him, has not been applied to the best purposes; "it would," he says, "have been equally convenient for me to have rooms *for my attendants to wash in*" (qu. 3483); and he in his turn complains that Mr. BROWN now wants another room (*ib.*) Some of the gentlemen, therefore, will, to a certainty, have to shift their quarters.

But Mr. ROBERT BROWN entirely objects to having anything to do with a garden. He thinks that to put an herbarium into a garden would prevent the herbarium being consulted with effect, and that, in short, a garden and an herbarium are things so essentially different that they are seldom thought of together. This gentlemen's evidence is as follows.

Qu. 3464.—Would not an advantage result to the botanical student from the connection of your department with living specimens of plants?—HARDLY ANY. That is to say, I think it would be much more than counterbalanced by the inconvenience of removing the collection to Kew, for example, as being the only botanical garden of any importance in the vicinity of London; but from which *it is much too distant for the convenience of botanists.*

3468.—Do not you think that it would be advantageous to the botanical student if your collection could be united with a good botanical garden, both of them being within a moderate distance of the wants of the metropolis?—The only such garden in existence, namely Kew Garden, is much too distant from the metropolis. I think *that by transferring the collection,* without a corresponding library, such as Sir JOSEPH BANKS's was, and such as I have access to here, although not equally convenient access, *it would become a dead letter. It could not, in short, be consulted with effect,* nor could the duties of the department be *satisfactorily* (!) carried on.

3320.—You have referred to the Jardin des Plantes at Paris; but the botanical collection there is a collection with a garden, is it not, and with living plants?—It is (along with the zoological and mineralogical collections) in connection with a garden certainly, but that depends on the garden being in the town. (!)

3321.—But the fact is, that the botanical collection is there connected with the living specimens of the plants?—It is; and chiefly from that cause.

3322.—Is not that the fact?—That is the fact.

3323.—Do not you think that that gives a great advantage to the botanical collection, and renders it an object of greater interest than it would be if it were separated from the garden?—I am not of opinion that it does so with respect to scientific consultation. *Consulting an herbarium and visiting a garden are two things* SO ENTIRELY DIFFERENT THAT THEY ARE SELDOM THOUGHT OF TOGETHER.

We need not say that the italics and other marks are our own.

If this astounding evidence were not found in a public document published by the authority of a Royal Commission, we should have regarded it as a provoking misrepresentation of the witness's words. An herbarium and a garden entirely different! Why until now we always thought they were so entirely the same that the only difference consists in an herbarium being a bad makeshift for a garden. The old name of an herbarium was Hortus siccus, or dry garden; and it perfectly expresses what the herbarium is. It is a collection of plants dried so that they may be examined at all times and under all circumstances; while a garden is a collection of living plants. Both are repositories of evidence, of which the student may make use; that use is easy in a garden, difficult in an herbarium. A good deal of tact and practice is required in the latter case, in addition to any acquaintance with science; in the former such tact and practice are superfluous. But more; it is notorious that a numerous class of facts cannot be ascertained at all by an herbarium; such as manner of growth, colour, texture, the forms of succulent organs, and all the phenomena of vegetable life; it is in a garden only that such points can be investigated. Vegetable anatomy, again, the foundation of vegetable physiology itself, consists essentially in an examination of living tissues; the aid which the herbarium affords in such an enquiry is altogether subordinate; very useful, very important, no doubt, but still less useful and less important than what the garden affords. In short an herbarium is a mere makeshift—a makeshift, indeed, indispensable to botanical enquiries, and undervalued by those only who are too ignorant of science to appreciate its importance—still a makeshift; it is a necessary appendage to a scientific garden; it is a place of reference when the resources of the garden are exhausted; but it is only consulted, unless to hunt up some bit of curious botanical history, when no better evidence is procurable—a circumstance which unfortunately is of hourly occurrence. In short nobody would look at an herbarium if they could find what they want in a garden.

No wonder that the commissioners were bewildered by Mr. ROBERT BROWN's opinions. Coming as they did from a witness whose scientific reputation is really of the highest order—a fact the truth of which has unfortunately been called in question lately by the preposterous adulation of ill-judging friends—the commissioners bowed, and stopped the enquiry; but their good sense prevented the expression of acquiescence in such views, and, in order that they might not be compelled to question the soundness of judgment of the witness, they compassionately passed the matter by without remark.

We say again, then, let the herbarium and botanical materials now in the British Museum be transferred to Kew, where there exists already one of

the noblest botanical collections in Europe, and a museum even now of great importance. Additions to it, such as Great Russell-street may furnish, inconsiderable as they are stated to be, will add to its value as a great national institution for the promotion of natural history. The Museum materials are not of themselves worth the rent of the rooms they stand in. We do not, however, press this as a measure to be immediately carried out; there are reasons, the force of which we willingly recognise, that render it inexpedient to disturb the present keeper of the herbarium. But the time must come when no such reasons will exist, and then we trust that these arguments will be remembered. In the meanwhile it is to be hoped that the Treasury will sanction no further outlay upon the botanical collection in the Museum. After having waited so long the public will consent to wait a little longer. The money required for fittings of "The Room" which has been selected for some exhibition which there is an *intention* of throwing open in the botanical department may be applied to other purposes, or wholly saved, and as for "The Room" itself, it would be only just to restore it to those who now complain that it has been taken from them.

OUR readers are aware that the earliest plants which it has been possible to propagate of the famous STANWICK NECTARINE were to be sold on Wednesday last, by order of his Grace the Duke of NORTHUMBERLAND, for the benefit of the Gardeners' Benevolent Institution. The sale has now taken place, and the following list shows the prices given for the lots, together with the names of the purchasers.

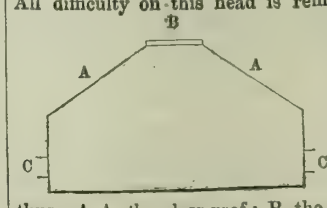
Lot 1 ...	£7	17*s.*	6*d.*	Mr. Low, Clapton.
2 ...	10	10	0	Do. Do.
3 ...	8	8	0	—Messrs. WHITLEY and OSBORNE, Fulham.
4 ...	6	16	6	—Messrs. HENDERSON, Pine-apple-place.
5 ...	10	10	0	—Messrs. WHITLEY and OSBORNE, Fulham.
6 ...	7	17	6	—Messrs. HURST and M'MULLEN, Leadenhall-street.
7 ...	8	18	6	—Messrs. VEITCH, Exeter.
8 ...	7	7	0	—Mr. TURNER, Slough.
9 ...	4	14	6	—J. H. BARCHARD, Esq., Putney Heath.
10 ...	3	13	6	Do. Do.
11 ...	5	15	6	—Mr. INGRAM, Gardener to Her MAJESTY, at Frogmore.
12 ...	4	14	6	—Messrs. YOUELL, Great Yarmouth.
13 ...	7	17	6	—Mr. GAINES, Battersea.
14 ...	9	9	0	—The Earl of DERBY.
15 ...	5	5	0	—R. HANBURY, Esq.
16 ...	8	18	6	—Messrs. LEE, Hammersmith.
17 ...	7	7	0	—S. RUCKER, Esq., Wandsworth.
18 ...	6	16	6	—Messrs. LUCOMBE, PINCE and Co., Exeter.
19 ...	4	4	0	—The Earl of HARRINGTON, Elvaston Castle.
20 ...	2	2	0	—Mr. DENTON.
21 ...	6	6	0	—Messrs. HENDERSON, Pine-apple-place.
22 ...	7	7	0	—Mr. GAINES, Battersea.
23 ...	6	6	0	—Mr. GLENDINNING, Turnham Green.
24 ...	5	15	6	—Messrs. KNIGHT and PERRY, King's-road, Chelsea.

£164 17 0

We give this list for two reasons; firstly, that the friends of the charity may see how effectually the operation is likely to benefit the funds; and, secondly, that the public may know who the nurserymen are that can hereafter supply the variety. A further and larger public sale will take place early in next autumn, on behalf of the charity, on which occasion Mr. RIVERS expects to have 500 young plants propagated; and no other genuine plants can be offered at that time. The earliest specimens which it is probable that the trade can offer, will be maiden plants in the end of 1851. It is desirable that this should be known, in order that those who have come forward liberally on the present occasion may receive all the advantage which can arise from the transaction.

It gives us much pleasure to add that the funds of the charity are flourishing, independently of the aid thus afforded, the subscriptions announced on Wednesday having been about 100*l.* more than at the last anniversary.

We believe that it is the wish of the noble Duke, who has permitted this admirable fruit to be dispersed among the public, that the money now and hereafter to be realised should form the nucleus of a fund for the construction of almshouses, an admirable proposition, to which we shall advert on another occasion.



ORCHIDS FOR THE MILLION.

I HEAR almost every day, of some new person, starting up (undeterred by the supposed great difficulties of cultivation) who are willing to make an attempt at "growing a few Orchids;" and further, I find that the collectors in the upper classes are also increasing. A small house for the growing the more easily cultivated Orchids may be had at a small cost; and I do not know any one class of plants that are so fit for the management of the amateur, as they afford amusement and occupation for all the year round; and there is, perhaps, scarcely a day in the year, but there will be some one plant or another in flower; and another advantage is that most of the species last for a long time in bloom, and nearly the whole of these may be safely brought into a warm sitting room during the time of their flowering. Mr. Webster (gardener to Mrs. Huskisson, Eartham), a successful cultivator, grows these plants principally as drawing-room and warm conservatory ornaments, and there is scarcely a time when there is not one or two Orchids in flower in either the conservatory or suspended in the drawing-room. I suspect that, with a little care and contrivance, a single house may serve for growing the whole collection, keeping one end nearest the door for the cooler climate, and for the preserving all those which are at rest; but there will in most houses either already built, or to be constructed, be little difficulty in having a glass partition, so as thus to procure the two climates. I have already addressed some observations to you, under the title of "Orchids for the Million," containing a few remarks on Mr. Bateman's work; and I was in hopes you would have advanced the cause I had at heart by a few editorial remarks. The ordinary catalogues will indicate the habitat of most of the species, and, consequently, will show whether the specimen is to be grown at the hot or cold end. Most of the East Indian species of course are to be in the warmest part of the house, but I suspect that whilst the plants are actually growing, so that there be plenty of moisture and plenty of air, all are the better for plenty of heat. Now, I know Mr. Williams (Mr. Warner's gardener), grows all his Cattleyas (except citrina), in the warmest part of his warmest house. As regards the question of growing on blocks or in pots, Mr. Mylam (Mr. Rucker's gardener) grows nearly all the plants in pots or baskets, there are very few on blocks, and yet this collection is allowed to be the finest in this or in any other country. As regards the size of the house, a very small one will hold a large number of plants. If the house is built low, so much the better, the grower will have a greater command of heat and moisture. I think most of the houses in which the large collections are grown are too large, and especially too high; and I understand that Mr. Blandy, finding his new house too large and too high has moved his collection into a lower and smaller house; this is I think the fault of the house at Kew, in which the fine collection belonging to that garden is grown. I hope soon to see my suggestion, as to the Kew collection, carried out; viz., the setting apart a small house into which all the Orchids in flower should be introduced, and keeping the larger house shut up so as to enable the person having the management of the plants to control the temperature; the public can only care to see those flowers which are in bloom, the botanist will on application always obtain ready admission.

I observe that Mr. Rucker is building a very well-planned house for the purpose of showing all those plants which may be in flower. I had proposed to have offered you some few general observations on the mode of cultivating Orchids, the result of my own experience and enquiries, but as I find Mr. Williams (Mr. Warner's gardener) has a work in the press containing practical observations on the mode of cultivating the most desirable of these plants, the simplest course will be to refer your readers to his forthcoming pages. Those who have seen the excellent cultivation of the collection under his care will have no doubt but that he is well able to lay down safe rules for the cultivation of these plants.

In forming a collection, with reference to their beauty rather than rarity, I have found some difficulty, especially as I have not had an opportunity of consulting the rarer works containing figures of Orchidaceous plants. The following is a list of about 200, which I believe are nearly all the best in general cultivation. I send it, as it may be useful to others as well as myself, to have it corrected or added to by any of your readers, they bearing in mind that the addenda to the list required is of ornamental plants.

I have more than once in your Paper advocated the construction of cheap houses, having got cheap and good glass; and as comparatively cheap timber is now to be got at the saw-mills, and since we shall have bricks for flued walls and cheap houses at 50 per cent. under the old cost, I maintain that a very reasonably good house, quite fit for growing a collection of Orchids, may be put up for 30*l.*, and that it may be heated for 25*l.* The main difficulty in building a house with a span-roof without moveable sashes, is the ventilation at the top. All difficulty on this head is removed by making the centre supporting the sash bars consist of a strong board of 9 inches or a foot wide, and having ventilators on hinges cut on this to open to let out the hot air; thus—A A, the glass roof; B, the board on the centre supporting the sashes on which at intervals shutters on hinges are inserted; for the side ventilation there are sliding shutters at C C, and the same at both ends.

LIST OF GOOD ORCHIDS.

Acanthophippium bicolor
" Sylhetense
Acineta Humboldti
" Barkeri
Acropera Loddigesii
Aerides affine
" crispum
" odoratum
" virens
" tessellatum

" maxillare
" rostratum
" tricolor.

N.B. The above names are those in common use amongst nurserymen and collectors.

P.S. I have met but one special, and at present serious, objection to the cultivation of Orchids for the million, viz., their cost; however, like all other matters of commerce, the supply will increase with the demand. Already we have constantly sales of imported plants at Mr. Stevens', and there are plants, such as the Barkerias, which sell for a few shillings apiece, and which were but a short time ago amongst the dearest; and as soon as there is a sufficient demand, nurserymen will propagate the quick growing plants fast enough, and sell them at a price within the reach of all. I feel certain that we shall soon see Dendrobium nobile car-

ried about the streets like the Cactus, &c. As regards the rarer and the more slow growing plants, the Aerides, Vandas, &c., these will always remain comparatively dear. But already orders have gone out, and collectors in all quarters are ransacking the forests, &c., to send home plants for Mr. Stevens' auction-room. I had a letter from a friend of mine at Penang, to whom I had written to collect plants for me, he said, "Our jungles are nearly stripped of all the Orchidaceous plants, such has been the demand for them of late." *Dodman.*

HITCHAM LABOURERS AND MECHANICS' HORTICULTURAL SOCIETY.

RULES TO BE OBSERVED BY THE MEMBERS OF THIS SOCIETY, FOR THE YEAR 1850:

1. Honorary members to pay from 1*s.* to 2*s.* 6*d.* annually.

2. Competing members to pay 6*d.* annually. The payments for the present year to be made before May 20th.

3. The specimens exhibited by competing members must have been grown by themselves in their own gardens or allotments. Should any one be guilty of an unhandsome attempt to impose other produce than his own culture upon the Society, he will forfeit all claim to a prize, and be dismissed from the Society with disgrace as a dishonest character.

4. The specimens forwarded for competition must be sent to the rectory before 10 o'clock on the days of exhibition. A number will be then attached to each; and the judges will decide, without being made acquainted with the names of the competing parties, to whom the separate specimens belong.

5. The award will be made known by 2 o'clock.

N.B. No gardeners will be allowed to compete; but there can be no objection to encouraging lads, under 16 years of age, to show flowers or vegetables reared entirely by their own care on a piece of ground assigned to them in a master's garden. It is hoped there will be no foolish jealousies and disputings about the award of the prizes. All who compete should give the judges full credit for acting to the best of their judgment. Those who gain no prize should take their disappointment manfully, preserve their good humour, and try again next year, if it should please God to allow them an opportunity of so doing. Any prizes to which the judges may consider there have not been sufficient merit to award them, will be reserved for a future occasion. *J. S. Henslow, Hitcham, May* 1.

DISEASES OF PLANTS.

(*Continued from p.* 292.)

16. *Blotches.*—I think that this disease, defined by some to be a discolouration, in the form of a black or yellow drop, which appears on various parts of the plant, and is caused by insects, may belong sometimes to the head of intrusion, sometimes to that of laceration. We have sometimes observed them without any appearance of external disorganisation, and they then indicate the existence of an egg; but we cannot deny that others are really the effect of laceration of some insect which has fed either upon the epidermis or upon the inner texture of the leaf under the epidermis.

17. *Vermination.*—Since the time of Theophrastus, this name has been given to fruits having a grub within-side. It is a very common disease in some plants. Some Pears have always a grub in their centre. Some plants have them in their seeds. Sometimes we see plants so loaded with grubs that every part of them is full. Observation has taught us that these internal enemies of fruits have been deposited there by butterflies and moths. Some lay their eggs in an oblique incision into the leaf, some penetrate even into the ribs. *Vermination* includes also the disease of seeds of grain, inhabited by the Curculio segetis, *L.*, and that of Nuts and Walnuts inclosing the larvæ of the Curculio nucum, *L.*

18. *Abortion from Insects.*—Insects are the cause that a vast number of plants remain sterile. It is generally from their having deposited an egg in the pistil. Thus the Livia juncorum, *L.*, lays its egg in the germ of the Juncus articulatus, *L.* The part thus injured acquires a size three or four times as large as usual, but remains sterile. The Acantia clavicornis, *L.*, depositing its eggs in the flowers of Teucrium, causes them to remain closed, discoloured, and barren. Sometimes insects prevent fecundation by the dispersion of pollen, but this appears to be a rare occurrence. The sterility derived from insects having eaten off the flowers, belongs to the head of lacerations.

From what I have now said, it appears to me to be clearly proved that all diseases occasioned by insects belong to the class of wounds, or mechanical injuries. If any one will read the beautiful general discourse on insects in the "Encyclopédie Méthodique," or the articles Insectes, Chenilles, and Lépidoptères in the "Nouveau Dictionnaire d'Histoire Naturelle," a work which should occupy a distinguished place on the shelves of the amateur, he will see in what a variety of ways insects and worms attack plants, and are the true cause of a great number of the evils that afflict them.

This would be the place to examine what are the surest means of protecting our farms and gardens from the incalculable injuries caused by insects. The nature of my subject does not admit of my neglecting this point, although I must candidly confess that as yet no method at once certain, easy, and economical has been discovered. But it is impossible not to encourage the hope that great progress may be made by the attentive study of the natural history of each species, and of the habits of those beings who, frequently from their minuteness, escape the eye of the observer, and who seem to evade every contrivance for expelling them.

Among the vast number of receipts, for the most part useless, prescribed in works on rural economy, the labours of some, especially of transalpine entomologists, have nevertheless supplied us in some cases with directions by which we may, if not wholly preserve ourselves from their ravages, at any rate diminish the damage effected. In my memoir on the pyralides which last year infested our Hemp grounds, I have shown how worthless are the generality of the receipts invented by quacks for the destruction of insects. I have shown that for the greater number of cases of insects infesting herbs, the only certain method is burning. I collected many facts in support of this doctrine, and showed that in all fields or pastures on which large fires are made, there appear scarcely any insects, and the soil is otherwise rendered more fertile. It is known also that one of the means which has proved the most certain for freeing Apple trees from caterpillars is that used in the province of Vicenza, where they shake the trees towards the end of March in order to find out where the caterpillars are, as they then may be seen to hang from their threads in consequence of the shaking, and their nests are then taken and destroyed. Frequent and abundant irrigations will destroy many larvæ. Knowing that butterflies fear the smell of dung, some have found it advantageous to hang baskets of it to the branches of trees to keep them away, but this can only be done to a very limited extent. I am convinced also that in some desperate cases it may be useful to suspend for a season, or to hasten or delay the period of sowing certain seeds; for, as it is well known that every insect has its own particular plant, if this one fails the insects perish, or those which remain become feeble, and, for the most part, incapable of reproduction. I have shown how ploughings in winter and the first days of spring will hasten the period of germination, and prove useful for our present purpose; and I have taken the same opportunity of urging the utility of rotations of crops. I will next add some observations on insects, of which I did not then treat, and which may be useful not only in the greater number of cases of arboriculture and agriculture in general, but also in some more special kinds of cultivation.

VILLA AND SUBURBAN GARDENING.

THE purest of all pleasures may be derived from a garden; but in order that we may enjoy these in their fullest extent, high keeping and order must form one of its distinguishing features. Gardens frequently get into bad condition from the want of method in the management of the labour employed. We often find better dressed gardens where only one man is kept than in others of greater pretensions, and this is easily accounted for. The one man relies on no other person to do the work for him; he knows that if it is not done by his own hands, it must be left undone; he cannot fall back and lay the blame upon another. Of course, one man can only do one's man work; but those who have experience in these matters will understand what a man of system can do compared with one of no system. These observations apply with equal, or even greater force to the amateur who cultivates his own little garden during his hours of relaxation. The first rule to be observed, is to do everything in time; "procrastination is the thief of time." Suppose a few rows of Peas are to be staked, or a row of Scarlet Runners, a box of Cucumbers or Melons that require stopping or thinning; if these are left for a few days beyond the period when they ought to have been attended to, we well know the check they receive from being moved about, which is sufficient to destroy half the crop; delay, therefore, not only tends to defeat the object of cropping, but it also so affects appearance and kindly growth, that the real interest which gardening pursuits afford is blighted in the bud. Another and equally valuable rule is, never to have more than one job in hand at once. The importance of this injunction will be apparent on a moment's reflection. Instead of any one matter being finished when it ought to be, the whole is delayed; consequently all suffer alike, whereas one matter, demanding attention, might be accomplished in proper season if followed up until it is completed. But independently of injury to the crops, confusion and disorder manifested everywhere in a garden must rob the proprietor of the pleasure he seeks in vain to realise in it. Let us also draw attention to the evils of such a system when applied to plant culture. In thousands of instances it renders the plant unworthy of the pot in which it is placed; creepers, if not trained in due time, get entangled, and the unravelling them injures and checks their growth. The performance of the operation too requires treble the time it would have occupied if effected at the proper time; I therefore earnestly counsel my amateur readers to do everything in proper season, remembering the old adage "that delays are dangerous." *Pharo.*

TRADE MEMORANDA.

HAS any one an analysis of the guano on board the Envoy and Commerce? or in the Ocean, bound for Belgium a short time since? If they have we should like to see it; or if they have the guano it might answer their purpose to have it analysed.

GARDENERS' BENEVOLENT INSTITUTION.

The seventh annual festival of this charity was celebrated on Wednesday, at the London Coffee House, when about 80 of the principal horticulturists, nurserymen, and seedsmen of London and its vicinity assembled under the presidency of the Earl of CARLISLE. At the upper table, besides the noble chairman, were seated H. T. Hope, Esq., M.P., Henry Pownall, Esq., and several others of the most distinguished friends of the Institution. After the usual loyal toasts, the CHAIRMAN rose to call attention to the special purpose for which they were assembled. We have hitherto (said the noble Earl), dealt only with those great things and persons connected with royalty, war, and the concerns of empires; but we are met together this evening to put forward the claims of the Gardeners' Benevolent Institution. (Hear, hear.) The first consideration that might naturally occur to myself is, what business have I to be in the chair on such an occasion, and to have thus the privilege of addressing you? for it is scarcely necessary that I should observe that I do not myself exercise the very honourable profession of a gardener, and furthermore I am sorry to say I am not fitted to hold the place amongst you I am now occupying, by any knowledge or proficiency I have acquired in your delightful science. ("Hear, hear," and a laugh.) But there seems to me to be this peculiarity in the business or profession of a gardener, that while it admits of the highest possible degree of progress and perfection, it also, in its most humble grades, and in artificial methods, opens up sources of healthful, innocent, and pleasurable employment. (Cheers.) The art of the gardener, dealing as it does with perhaps the most exquisite of all the raw materials which Nature supplies—the flowers of the earth; the art of the gardener seems to me to combine the healthy exercise and sturdy out-door life of the agricultural labourer, with the more intellectual and studious employment of furnishing models for the most ingenious imitations of the milliner, the most delicate enamellings of the jeweller, the richest colourings of the painter, the brightest day dreams of the poet—(hear, hear)—and there is hardly a spot of earth so rugged, scarcely a tribe of man so rude, that the art of the gardener will not be found to produce something like loveliness to the scene, and some idea of beauty to lift up the mind to the supreme fountain of light and beauty, and the Giver of all goodness (cheers); and the pursuit of gardening, gentlemen, seems to me not only to enhance, but also to make compensation for the beauties of nature—for the charms of scene, and the loveliness of landscape, are necessarily confined to limited portions of the globe's surface. The full enjoyment of these can be but the privilege of the few, and it is only some amongst us who can visit, and comparatively very few can enjoy permanently, such scenes as the valley of Cashmere, the Bay of Naples, the shores of Genoa, or even our own Windermere, Loch Lomond, or the lakes of Killarney, present to us. (Cheers.) But we must remember that there is hardly any spot of ground so built on but the monotony of the scene may be diversified by the gay parterre—scarcely a cottage so small that it may not have the Woodbine twining round its porch; nay, more, there is hardly a lodging or dwelling in the most squalid alley of this metropolis, but it may have its Geranium in the window sill—(hear, hear)—and I have heard, and I believe the statement is true, that the poor weavers of Bethnal-green take especial pride in rearing their Geraniums, their Hyacinths, and their Tulips. (Cheers.) It would thus appear that there is a sort of spell or charm about flowers, something like magnetism or mesmerism, which, independently of fashion, or the pleasures of sight and smell, tends to sooth the spirits and compose the mind. (Hear, hear.) I need not seek, gentlemen, to corroborate the respectability or honour of your craft, by alluding to its antiquity; but you will not forget that the first spot on which man was placed on earth was a garden, and it is fair to presume that the first avocation of man must have been that of a gardener—(cheers), —and the shrubs must have been green, and the flowers must have looked bright among the glades of Eden before sickness, pain, sorrow, or sin entered into our world. (Cheers.) However, gentlemen, we know that those drawbacks and disfigurements abound near the pursuit and profession of a gardener as they do to every other calling or occupation. And this brings me especially to the claims which such a charity as this puts forth for your support. I learn, gentlemen, that the Gardeners' Benevolent Institution is adapted to afford relief to aged and infirm gardeners above 60 years of age, and their widows, in all parts of the United Kingdom; that it has now 34 pensioners upon its funds, 11 women and 23 men, whose claims have all borne the strictest investigation, and who have been reduced in their old age to penury and destitution; and I find that the average ages of these parties are 74 years for the women, and 76 years for the men. I am further told that it will appear by one of your rules, that this society, besides providing pecuniary relief for the distressed and broken down, in the shape of charity, partakes also of the nature of a friendly society, and encourages contributions from gardeners, by promising which, while in the hey-day of their vigour and prime, they acquire a right of preference and a title to the enjoyment of your bounty in the event of darker days coming across them. (Applause.) I find that during the few years (8 I believe) that the Society has been in operation, it has contributed relief to the amount of 2280*l.* (Hear, hear.) But does the relief it is enabled to give meet all the claims made upon it? By no means. I regret to have to add, that, though this much has been done, yet at this time your committee, out of 20 eligible candidates for your bounty, can only elect two of them this year. (Hear, hear.) I have now to invite your considerate attention on behalf of these broken-down veterans in a pursuit so honourable, so respectable, and so useful. You will not forget—I am sure those who exercise the same craft will not forget—you will not forget, you who, by the favour of your Creator, are in easy circumstances, and in an affluent position, that all the enjoyment you derive from what is beautiful to the sight and fragrant to the smell in the rich and varied products of your gardens—you will not forget that the life and pursuit of a gardener is a laborious one, and subject to much competition; subject to many reverses; subject to the change of taste, and the caprice of fashion, and trying and unhealthy to some constitutions; exposed to unhealthiness in some situations, and often bending the stout back and stiffening the active limbs of those who minister to your luxury, your comfort, and your pleasure. (Hear, hear.) These are claims which you will not, I am sure, forget. You will remember that in the brightest foliage, and in the most gorgeous colours, there often lurks the most mischievous poison, and that even the fairest rose is never without its thorn—(hear, hear)—above all, you will remember that amid all that is bright and beautiful in nature, there is still no blossom of plant or shrub or tree that blows with such unfading colours—there is no scent of earth so fraught with undying fragrance—as the bloom of good and charitable works, and as the sweet-smelling savour of that pity which feels for the wants and relieves the distresses of our friends and our brothers. (Loud applause.) Gentlemen, I feel that a cause like this is safe in your hands, and I have only to recommend, with all good-will and all the fervour it deserves, the claims of this institution on your support, and to beg that you will join with me in drinking "Success to the Gardeners' Benevolent Institution." (Loud cheers.) The toast was drunk with three times three and one cheer more.

H. T. HOPE, Esq., M.P., proposed the next toast, "The health of the Chairman," who had given up (as he must have done on such a day) engagements of a pressing and earnest nature to take the chair on behalf of this charity. The toast having been drunk with enthusiastic cheering, the CHAIRMAN, in acknowledging the compliment, said, it was quite true that the duties of the day would naturally have called for his presence elsewhere, but he felt, at all events, that he could not spend her Majesty's birthday better than among her faithful gardeners. He would now give them the toast, "The Horticultural Society," coupling with it "The health of Mr. Paxton." (Hear, hear.) The services that gentleman had rendered to horticulture were recognised not only in this metropolis and in this country, but wherever flowers were cultivated or admired, and that was over the whole world. (Hear, hear.) Mr. PAXTON returned

thanks. He said he had been most unexpectedly called upon to respond to this toast. No one rejoiced more at the position or was more anxious for the success of the Horticultural Society than himself, for he had been intimately connected with it from its first establishment. He believed he had planted with his own hand or put down into the earth every plant in the arboretum at Chiswick—at least all that stood there 24 years ago, for it was 28 years now since he had first become connected with the Horticultural Society of London, and then that which was now the Horticultural Gardens was a market garden, growing Apple trees and vegetables; and though he did not form the ornamental portion of the gardens, the other parts were almost wholly executed under his direction. (Hear.) He had great pleasure in responding to this toast, the more so as the nobleman whom he had the proud satisfaction and honour to serve was the President of that Society, and he could say, without fear of contradiction, that no man living had given so much attention to the development of horticulture as that nobleman, who had placed at his (Mr. Paxton's) disposal ample means and every facility for the advancement of that science, and if he had not succeeded in all he had undertaken it was not for want of means or opportunity. (Hear.) He had also pleasing recollections of the Horticultural Society on another account, viz., that it was the medium through which he was first introduced to that nobleman. (Hear, hear.) He believed that Society had done much good in every department of gardening. Before that Society was established there were no means for men fond of the science of gardening, for noblemen and gentlemen who had a taste for, and were desirous of patronising the art, to assemble and commune together with a view to its advancement. The late Sir J. Banks and a few other distinguished men, under these circumstances, established the Society, which had now grown up and become a most valuable institution. (Hear, hear.) From that society had emanated that foremost and most distinguished of collectors David Douglas—(hear)—an old and esteemed friend of his, who had lost his life in the pursuit of his art, and than whom no man of science had left a higher name behind him. The Horticultural Society had patronised David Douglas, and had also fostered and encouraged many other gardeners of great eminence; and another claim that it had upon their attention and respect was, that it tended materially to the establishment of this Institution. (Cheers.) He believed the periodical shows of the Horticultural Society at Chiswick had been of great benefit, by bringing together the patronisers of the art, and giving the most practical encouragement to its pursuits. (Cheers.) There had already been many offshoots from the Society, as the Botanic Society in the Regent's Park, and several others. He thanked the company very sincerely for having drank success to a society in whose welfare he was warmly interested, and which deserved every encouragement at their hands. (Hear.) With regard to himself, all he could say was, that he thanked them most cordially for having associated his name with that of the Society in the toast. (Cheers.) The CHAIRMAN next gave, "Success to the Royal Botanic Society," between which and the Horticultural Society he hoped there would always be an honourable but not a hostile rivalry, for there was quite room enough in this metropolis for both. He would couple with this toast the health of Mr. Hope. The toast was drunk with honours. Mr. HOPE, M.P., returned thanks. The Botanic Society had, without money, and without means, succeeded by the energy of some half dozen energetic men, of whom he was not one, in attaining its present position of independence. For the first exhibition of this year they had already sold 16,000 tickets. (Hear, hear.) After some other toasts, the contributions of the evening were announced as being near 400*l*. The principal subscriptions handed in on the occasion were:

Duke of Devonshire	£21 0	H. Berens, Esq., for his gardener, Mr. Stanly	£10 10
Earl of Carlisle (Chairm)	10 10	Mr. Joseph Robinson	10 10
Joseph Martineau, Esq.	10 10	Dr. Lindley	5 5
Messrs. Wrench & Sons	10 10	Capt. James Lamont	5 5
George Bishop, Esq.	10 10	Robert Hanbury, Esq.	5 5
Proprietors of Gardeners' Journal	10 10	Robt. L. Holford, Esq.	5 5
Thomas Rivers	10 10	John Lane, Esq.	5 5
Henry Thomas Hope, Esq., M.P.	10 10	Arthur Pott, Esq.	5 5
A. F. Slade, Esq.	10 10	James Thomson, Esq.	5 5
Messrs. Noble and Co.	10 10	Messrs. Miniers & Co.	5 5
Joseph Paxton, Esq.	10 10	Editor of the Gard. Mag.	5 5
		Mr. Glendinning	5 5

Home Correspondence.

Grape Rust.—The following statement may tend to strengthen one of the many suggestions already pointed out with regard to this malady to which the Grape is so liable; and as my case is so clearly proven to have proceeded from the effects of sulphur, my remarks may be the means of protecting some good Vine borders from condemnation. Two seasons ago the leaves of my early Vines were attacked with red spider, in consequence of which I was obliged to use sulphur for its destruction. I applied a little at short intervals, which did in some measure keep under that pest. I observed, however, that some of the berries were inclined to rust. I gave the border the merit of this, being, as I thought, too wet. In the following season I was afraid of a second attack of my enemy, therefore I applied the sulphur earlier and to a greater extent than before. Not being aware of its evil propensities on the berry, I thought if the foliage was preserved all would be right; but when the fruit came to be the size of Peas, I found, to my astonishment, their surface covered with rust to a fearful extent. I of course still continued to attribute the fault to the border. As I allowed no handling in the process of thinning, I was aware that it could not arise from that. Seeing, however, the evil effects of sulphur on young Grapes pointed out, it struck me that it might be the cause of my complaint. I concluded that I should put the experiment to the test next season (this one); I have, accordingly, never sulphured, and and the result is most satisfactory. I have a fine crop of fruit without the least symptoms of disease of any kind. I have therefore come to that conclusion, that where sulphur is applied early, that is to say while the skin of the berry is young and tender, rust will unavoidably follow; and I believe that many of the cases that we are daily hearing of proceed from the same cause. *Northman.*

Green Peas. — Having gathered some Peas this morning for my friends, I beg to send a few for your inspection. They were raised without artificial heat, on the principle of root ventilation. I have not grown many, but merely tried an experiment, with five of the reputed earliest sorts. They were all sown on the 12th of December last, and those now sent are the most forward by 14 days. They are Cormack's Prince Albert. They were in bloom on the 7th of April; and had the weather been fine, I should have had the Peas in April. However, as I have established the fact that I can grow them without heat earlier than usual by fully a month, I hope in another season to send you a dish worthy your notice. *J. Roberts, Eastcheap.* [Green Peas from Cornwall have been in the market these two weeks past.]

Observations on the Adjustment of the Animal and Vegetable Kingdoms, by which the Vital Functions of both are Permanently Maintained (*see p.* 279).—The interesting paper extracted from the "Florist, and Garden Miscellany," under the above heading, was the subject of a communication to the Chemical Society of London, and was forwarded to me by a correspondent. I very much regret that this information was not appended to the article, as in its present state it looks like an original communication, which it was not. *Edward Beck.*

Culture of the Chrysanthemum — It has been acknowledged by all who have witnessed the Chrysanthemum exhibition of the Norfolk and Norwich Horticultural Society, that in no county in England is this beautiful autumnal flower exhibited in a higher state of perfection than in Norfolk, and having received numerous letters of inquiry respecting the mode of cultivation pursued, we have taken advantage of your columns in giving publicity to the same. We do not wish it to be understood that every exhibitor pursues this precise method of treatment, but it is such as we ourselves adopt, and we venture to say that if carried out it will ensure dwarf plants from 1½ to 2 feet high, covered with rich dark green foliage, and carrying blooms from 5 to 7 inches in diameter. In the last week in May we select the tops of the strongest shoots for cuttings, putting four or five round the edge of a 3-inch pot, and placing them in a gentle warmth; when rooted they are potted singly in the same sized pot, and kept ia a close frame for a few days, until they have become established; the tops may then be pinched out, leaving five or six joints to remain for lateral shoots; after a few days' hardening off they are then removed to an open situation, allowing the plants a sufficient distance from each other to prevent their drawing, care being observed that they do not suffer from want of water. About the third week in July we shift for blooming into 7-inch pots, using a small handful of coarsely broken bones at the bottom. The soil we use consists of equal parts of well decayed (one year old) pig manure, turfy loam, and leaf-mould, adding half a barrowful of peat and half ditto of road drift to every four barrows of the above. When potted they are placed in rows 2 feet apart, and they require but little attention, except watering, for two months; at the expiration of this period we commence watering twice a week with liquid manure made with one bushel of fresh pig manure (free from straw), to about 80 gallons of water; this will be ready for use in two or three days. As soon as the plants show flower-buds, we tie each shoot to a stick, and train them fan-shaped. Disbudding ought now to be attended to, reserving only one or at most two at the top of each shoot; but where two are left, it is better to take out the second bud and leave the third, to prevent confusion. As soon as the buds show colour, the plants are then removed to the greenhouse or conservatory, giving plenty of air and substituting water for liquid manure. We ought to have mentioned that where a profusion of bloom is required, two or three plants may be inserted in the pots where only one is usually grown; this will afford an opportunity of cutting away the weakest shoots, and reserving the strongest only. *Youell and Co., Great Yarmouth.*

Guano.—The farmers and gardeners of this country owe you much for the exertions you have made to secure them against the tricks of the guano trade. I have discovered the hill side to which you allude in your leading article, and it is truly a real California. The trade is brisker since your exposure than it was before; "the waggon" has got an extra horse in it, and an extra waggon is put to work. The bags hold about 3 or 4 bushels, and are placed generally in the bottom of a covered waggon, but sometimes I see they have two layers of bags, one above the other. This I imagine depends upon how fast they can dig it on the hill side. If the company is carrying on this for the adulteration of guano, then I say there is no other way of putting a stop to it than by Government interference. No one person can do it. *Dulwich, May* 16.

The Stanwick Nectarine. — In November, 1848, I had some young Peaches potted, which had been raised from seed the preceding summer; intending to try an experiment in grafting Peaches (it may be mentioned that they are invariably budded), the Stanwick Nectarine happened to run to mind, and I thought my Peach stocks might possibly be turned to good account, by grafting the shoots of that rather than of Peaches. I therefore wrote to the gardener at Stanwick, to send me the prunings of the tree in lieu of, as usual, consigning them to the rubbish heap. The shoots were received in December, and immediately grafted on my Peach stocks in pots; nearly 200 were I think grafted, placed in a cool house secure from frost, and towards the end of January removed to gentle bottom heat over a tank; they seemed at one time as if every graft would grow. But, after making a shoot nearly an inch in length, they gradually died off, so that in the end only 25 were left. Twenty-four of these were sold on Wednesday last, and realised such prices as were never yet heard of for small trees of a Nectarine. What a solid benefit has thus resulted from a few apparently worthless shoots, and what a lesson to us gardeners never to despair, but to "try and trust." *T. Rivers.*

Fish Ponds.—In a garden attached to the premises in which I reside is a fish pond, in which are some Water Lilies and other aquatic plants. The Lilies have for some time looked unhealthy, and weighed down; on examining them, I find that the leaves are covered with the enclosed gelatinous substance, which I presume is a Mollusca of some water snail. Will you inform me if such is the fact, and if it is desirable to let it remain as a food for the fish? *C. E., Hanwell, May* 3. [We did not find the gelatinous substance spoken of.]

Societies.

LINNEAN, *May* 7.—The President in the Chair. M. Alphonse De Candolle, and Asa Gray, M.D., were elected foreign fellows, Dr. Lankester, E. Newman, Esq., and W. Spence, Esq., were appointed auditors. The President exhibited a leaf of Victoria regia, Lindl, obtained from the stove of the Duke of Northumberland, at Sion, where a plant is now flowering. The President said that some question had been raised as to the propriety of establishing a new genus for this plant. The characters which distinguished it from Euryale were sufficiently distinct; but whether they were of primary or secondary importance he would not pronounce. He thought the bodies which were ordinarily called stigmas, belonged to an outer series of floral appendages, whilst the true stigmas were seated below, directly over the summit of the fruit. "Notes on the Dry Rot, as observed in the church of King's Wear, Devonshire," by A. H. Holdsworth, Esq., communicated by the President, were read. In this instance some old wood was employed in a new building, and the rot spread in particular directions. On removing the affected portions of wood, the rot was speedily arrested. A letter was read addressed by the President to Sir Francis Beaufort, for communication to Baron Alexander von Humboldt, on the origin and mode of propagation of the Gulf-weed. Mr. Brown was of opinion that there was more than one species of plant included under the term Gulf-weed. Although the opinion had been pronounced that this plant grows on the shores of the west, and was brought out to sea by the Gulf-stream, he had observed certain appearances which led him to believe that the Gulf-weed might propagate itself whilst floating in the waters of the ocean.

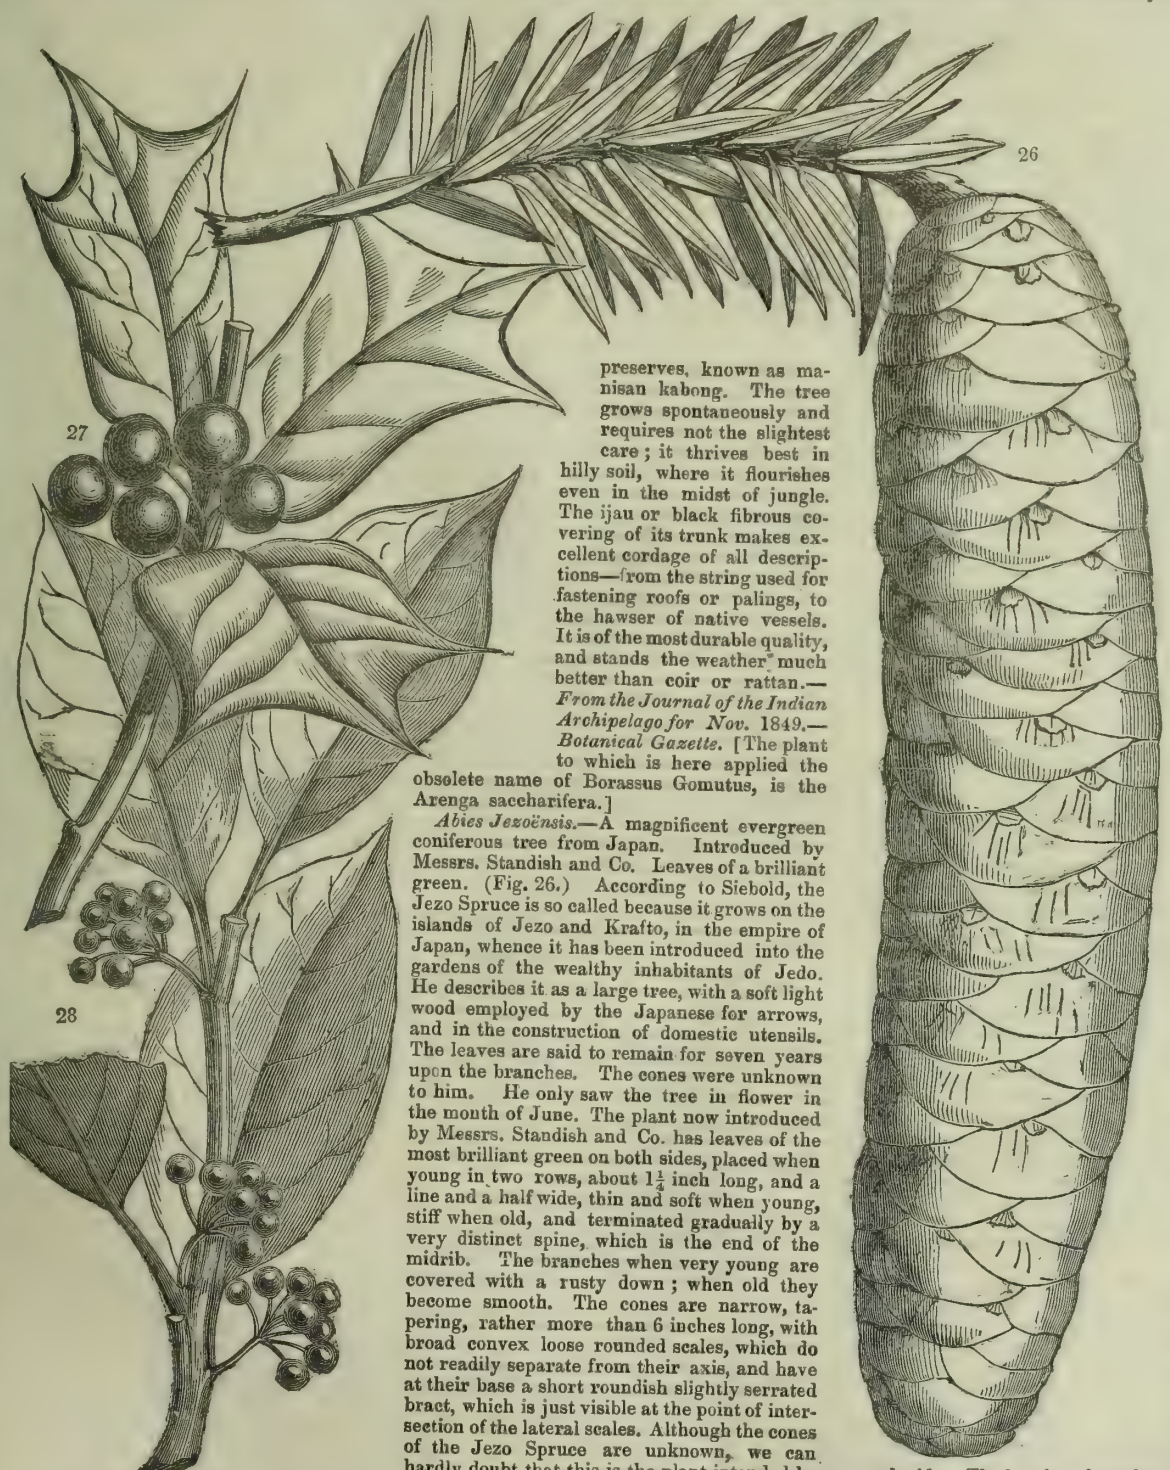
Garden Memoranda.

FLOWERING OF THE VICTORIA REGIA AT SION HOUSE, BRENTFORD.—As many of our readers know, this queen of aquatics has been flowering here for these two or three weeks past; and if we may judge from the quantity of flower-buds and young leaves at present in sight, it may be expected to go on blossoming for some time to come. When we state that this Water Lily has not only been grown but flowered in the comparatively short space of three months in a slate tank of about 22 feet long and some 12 feet wide, and at no very great cost for fuel and other appliances, many may be induced to become cultivators of so truly curious and magnificent a water plant, who have hitherto considered it beyond their reach.

The plant at Sion was received from Kew in the 2d week of September last. It was then a very small affair, the largest leaf not being more than 4 inches in diameter. No convenient receptacle having been previously provided for it, three Nelumbium tubs, *i. e.*, tubs in which Nelumbiums had been cultivated, were procured, one of these was filled with water, and in this the pot containing our aquatic was plunged. The other two tubs were placed one above and the other below this one, for the purpose of circulating and changing the water, which was led by means of a siphon out of the higher tub into the one in which the plant was, from thence into the lower tub, and out of that it was again pumped into the higher one, thus producing a continual flow of water from the higher tub to the lower one, a point (the circulation of the water) which Mr. Ivison considers of the highest importance in the culture of this aquatic. It was shifted first into a pot and then into a basket while it remained in the Nelumbium tub, which was at last enlarged to 6 feet square at the top by means of sheet lead, and even under those comparatively disadvantageous circumstances it made very satisfactory progress. A slate tank, 22 feet long, 12 feet wide, and 2 feet 6 inches deep, becoming shallower as its sides were approached, was about this time constructed for its reception. A hillock of well decayed turfy loam, mixed with a little river sand, and having brickbats below to keep it open, was placed in the middle of this tank, and the plant was planted out on this hillock a little after Christmas. The water in the tank is warmed by a 2-inch pipe at top, and a 4-inch pipe at bottom, and it is fed from a small slate cistern at one end, which keeps continually pouring warm water on a broad wheel about a foot in diameter, whose revolutions produce motion in the water in the large tank, the whole being supplied from a rain-water cistern in the open garden. The water is kept at a temperature of 85°, and the air of the house (formerly a low lean-to, but now altered to a span roof) between 80° and 90°. Since the house has been altered, the tank has been enlarged to 22 feet square, each corner containing Nymphæas of different colours, and there are also two Nelumbiums near the centre, whose foliage rising as it does above the surface of the water, gives to the whole an artistic appearance, which it would not otherwise possess.

At the present time, the plant has 10 leaves on it,

and one just expanding. Several of the leaves measure 5 feet in depth. They are almost quite circular, pink on the under sides and deeply ribbed, and most of of them have a turned up rim of from 1½ to 2 inches in diameter. The outside of the rim is a beautiful rosy purple on the side next the sun. It will be recollected that the rim never or very seldom showed itself on the leaves of the plant at Chatsworth, and Mr. Ivison attributes its production to the abundance of air which the small house at Sion allows him to give. The first flower opened on the 10th of April, and since that date up to the present time more than a dozen flowers have opened and closed, and there are now four flower-buds in sight. A flower-bud always follows the development of a leaf, on which, after a wavy motion, first to the right and then to the left, it finally places itself, and there it expands. The flowers continue in existence about two days. They open at 5 o'clock in the afternoon of the first day, and remain open all night. They close next morning between 10 and 11 o'clock, and reopen at 2 o'clock; the petals, which before were white, being this time changed to pink. These gradually fall down on the water, and an inner row of large petals, striped and mottled with purplish red, is unfolded about 3 o'clock; the latter reflex, and fall back on the others about 4 o'clock, when the whole flower assumes a flattened appearance, and discloses to view a quantity of smaller petals, overlapping each other and tapering to a rosy point in the centre. About 6 o'clock in the afternoon of the second day, it puts on its last form, exhibits to view a mass of yellow stamens, surrounded by a ring of small red and rosy petals, which, contrasting with the light coloured reflexed petals below, give the flower at this its last stage a beautiful and even striking appearance. After the flower has died off, it leaves a seed-vessel, having almost the exact shape of a large Meerschaum tobacco pipe. Some of the blossoms at Sion House measured 13 inches across.



It is much to be regretted that this fine Water Lily is tender; its large round leaves, even if it did not produce flowers, would form a noble appearance in our ornamental waters, and if it were possible to render its constitution hardier by crossing it with some less tender kind, the subject is one worth the attention of the hybridiser.

Mr. Groom's Tulips.—We paid a visit to Clapham on Thursday last for the purpose of inspecting these; but with a few exceptions they had not opened their flowers. They will be in perfection next week, when we hope to see them again.

Miscellaneous.

Uses of the Borassus gomutus.—The Kabong or Borassus gomutus is a Palm-tree of some importance. It grows to the height of the Cocoa-nut and sago trees, and is cultivated principally for the juice which it yields for the manufacture of jaggery. Like the Cocoa-nut and many other intertropical trees, it comes into bearing after the seventh year. It produces two kinds of mayams, or flower buds — male and female. The female shoot yields fruit, but no juice, and the male *vice versâ*. Some trees will give five or six female shoots before they yield one male, and such trees are considered unprofitable by the toddy collectors; but it is said in this case they yield sago equal in quality though not in quantity to the Cycas circinalis, although it is not always put to such a requisition by the natives; others will give only one or two female shoots and the rest male, from each of which the quantity of juice extracted is the same as that obtained from ten cocoa-nut shoots.

A single tree will yield in one day sufficient juice for the manufacture of five bundles of jaggery, valued at 2 cents. each. The number of mayams shooting out at any one time, may be averaged at two, although three is not an uncommon case. When sickness or other occupation prevents the owner from manufacturing jaggery, the juice is put into a jar, where in a few days it is converted into excellent vinegar, equal in strength to that produced from the vinous fermentation of Europe. Each mayam will yield toddy for at least three months, though often for five, and fresh mayams make their appearance before the old ones are exhausted; in this way a tree is kept in a state of productiveness for a number of years, the first mayam opening at the top of the stem, the next lower down, and so on, until at last it yields one at the bottom of the trunk, with which the tree terminates its existence. The fruit-bearing mayam has a beautiful appearance, the nuts hanging in clusters of many thousands, and when green the transparent kernel is made into preserves, known as manisan kabong. The tree grows spontaneously and requires not the slightest care; it thrives best in hilly soil, where it flourishes even in the midst of jungle. The ijau or black fibrous covering of its trunk makes excellent cordage of all descriptions—from the string used for fastening roofs or palings, to the hawser of native vessels. It is of the most durable quality, and stands the weather much better than coir or rattan.—*From the Journal of the Indian Archipelago for Nov.* 1849.—*Botanical Gazette.* [The plant to which is here applied the obsolete name of Borassus Gomutus, is the Arenga saccharifera.]

Abies Jezoënsis.—A magnificent evergreen coniferous tree from Japan. Introduced by Messrs. Standish and Co. Leaves of a brilliant green. (Fig. 26.) According to Siebold, the Jezo Spruce is so called because it grows on the islands of Jezo and Krafto, in the empire of Japan, whence it has been introduced into the gardens of the wealthy inhabitants of Jedo. He describes it as a large tree, with a soft light wood employed by the Japanese for arrows, and in the construction of domestic utensils. The leaves are said to remain for seven years upon the branches. The cones were unknown to him. He only saw the tree in flower in the month of June. The plant now introduced by Messrs. Standish and Co. has leaves of the most brilliant green on both sides, placed when young in two rows, about 1¼ inch long, and a line and a half wide, thin and soft when young, stiff when old, and terminated gradually by a very distinct spine, which is the end of the midrib. The branches when very young are covered with a rusty down; when old they become smooth. The cones are narrow, tapering, rather more than 6 inches long, with broad convex loose rounded scales, which do not readily separate from their axis, and have at their base a short roundish slightly serrated bract, which is just visible at the point of intersection of the lateral scales. Although the cones of the Jezo Spruce are unknown, we can hardly doubt that this is the plant intended by Siebold; at least we observe nothing at variance with his figure and description, except that he describes the young branches of that species as being smooth; in the plant before us they are covered with short down, but they become smooth with age; and as he describes those which he saw as having a yellowish rusty coat, the apparent difference is reduced to little. Probably perfectly hardy, but that is not yet ascertained. *Paxton's Flower Garden for May.*

Ilex cornuta.—A fine, hardy, evergreen Holly, from the North of China. Introduced by Messrs. Standish and Co. (Fig. 27.) When Mr. Fortune was in China (in the service of the Horticultural Society) he found this in flower somewhere in the neighbourhood of Shanghae, in April. During his present visit to that country he had again met with it, and in fruit, at a place called Kin-tang. It is a very remarkable plant, and promises to be, to English gardens, of much importance, on account of its hard, dark green evergreen foliage and large berries. The leaves are almost always furnished with three strong spines at the end, but when the plant is young there are added one or two more on each side. In the old plant the latter wholly disappear, while the end spines will occasionally extend, turn up their edges, and assume the appearance of strong horns.—*Paxton's Flower Garden for May.*

Ilex microcarpa.—Another hardy evergreen Holly from the north of China. Introduced by Messrs. Standish and Co. (Fig. 28.) Concerning this new shrub, we have no information beyond the statement that it was found at Tein-tung. The aspect of the plant is not unlike that of an evergreen Oak, but the leaves are quite smooth on each side. The berries when ripe are very small, and appear to be unusually pulpy, for, on drying they shrivel up, and leave the ribs of the four stones which they enclose quite apparent. It seems allied to Thunberg's Ilex rotunda. *Paxton's Flower Garden for May.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

As all the principal potting is or ought now to be completed, the routine work in this department will consist in watering, airing, and shading; training the plants, and keeping them and the houses perfectly clean. If the pots have been perfectly drained, and the plants potted in open soil, water may be liberally administered to those which are growing and rooting freely. But if anything like stagnation be observed, the fault may generally be attributed to some defect in the drainage, which should be immediately examined and put right. Sufficient air should at all times find admission into the houses, to produce a free circulation; but during the more active season of growth more than this is unnecessary, unless for the purpose of moderating the temperature in very hot weather. Shading should only be used in strong sunshine, and should be so arranged that it may be easily removed, or reapplied in changeable weather. Moisture, in conjunction with a high temperature, is indispensable for plants in a growing state. Where bottom heat is produced by tan or other fermenting materials, be careful that it does not decline

before the plants have completed their growth; but on the first indication of the heat failing, the bed should be stirred up and some fresh material added. All growing plants will require constant attention in the training, and occasionally stopping of the young growths, especially of those intended to form handsome specimens. To plants in a growing state, the allowance of heat, shade, and moisture during the day, should be increased rather than decreased, proportioning them to the still increasing strength of light; but avoid a high temperature during the night—68° is sufficient for anything—and whenever the weather is so warm as to raise the internal temperature higher than this, give air more abundantly; but, even in such weather, a little fire will be necessary the last thing at night to prevent the house being too cold at daybreak next morning. Let syringing be performed in good time in the afternoon, that superfluous moisture may dry up before dark; and to assist this some of the ventilators should be opened in the course of a couple of hours after syringing, and allow this air to remain on all night. This applies especially to houses with closely glazed roofs, where sufficient air to prevent stagnation cannot enter by means of the laps. Pelargoniums, Calceolarias, and other summer-flowering greenhouse plants should be accommodated with sufficient room to stand without being crowded, and that they may enjoy the full benefit of the sunlight with a free circulation of air. The flower stems of the Calceolarias should be supported with small neat stakes.

FORCING DEPARTMENT.

PINERIES.—Let the plants be liberally supplied with moisture during their growth, and especially those which are swelling their fruits; to the latter it should be given in the shape of liquid manure, and where it is desirable to produce the fruit as large as possible, its swelling will be assisted by removing useless suckers, and by affording a slight shade during bright sunshine. Maintain a moist atmosphere by sprinkling the paths, walls, and other evaporating surfaces, and by loosening the tan, to induce an exhalation of the congenial vapour arising therefrom. VINERIES. — Attend to tying, thinning, and stopping. Where plants of any kind are necessarily grown beneath Vines, the shoots of the latter should be stopped at the first joint above the fruit, and the spurs on which there is no fruit should be stopped at the fourth or fifth leaf. This will also apply to Vines on the rafters of greenhouses, which are just now breaking. In disbudding, not more than twice the number of shoots necessary to produce a crop should be retained, one half of which will carry bunches this year, and the other half will make wood on which to produce next year's crop. PEACHES AND NECTARINES which are just ripening should be assisted by a dry atmosphere, a free admission of air back and front, and by removing any leaves which shade the fruit from the rays of the sun. In the succession house very little fire will be required at night, if the sun-heat is properly economised by closing early in the afternoon. Tie in the young shoots as they advance.

FLOWER GARDEN AND SHRUBBERIES.

We feel it our duty to urge every gardener to proceed with the greatest possible despatch in planting out his bedding stuff; and particularly to take advantage of moist, showery, or dull weather; to push this work on with extra speed by borrowing workmen from other departments; that as soon as the season is sufficiently advanced, the plants which are properly hardened may be in their final situation as soon as possible. Annuals which have been sown or pricked out into frames or beds require transplanting into their final situations, and biennials into reserve beds for planting out next spring. A sowing of annuals should now be made for autumn flowering, including Mignonette, Nemophila, Virginian Stock, Silene, Collinsia, Sweet Pea, Gilia, Kaulfussia, Godetia, Clintonia, and any others which are sufficiently showy, and which come quickly into flower. Particular attention should be paid to the Rosery; the young buds will want looking after as carefully as those of Apricots, as they are troubled by caterpillars in a manner very similar, and, as in the case of the fruit trees, the best remedy is to examine them carefully and destroy the caterpillars with the thumb and finger. Shrubs which have been recently planted should not be allowed to suffer for want of water.

FLORISTS' FLOWERS.

TULIPS.—Seedlings as they expand must be marked, either for trial a succeeding season, or to be discarded altogether; it is useless, for instance, to preserve those which have either ill-formed or stained cups. The generally acknowledged standard is half a globe; therefore those which have long or pointed petals are out of the question. Form now is considered of very great importance; no other excellencies counterbalance a defect in this particular. Many seedlings have an impure base; this will occasionally "break out" when the flower blooms in a perfectly feathered state, but when flamed it is always apparent, and the variety will be valueless. The awning of the best or main bed will of course be on, though the Northerns will want all the sun they can get if they are to exhibit at either of the Manchester shows. PANSIES do not succeed very well under an awning; the best plan is to shelter the individual flowers required for exhibition with a neat shade. Much care must also be taken in the selection of seedlings, for in truth their name is legion; attend to rotundity of outline, substance of petal, and clearness and intensity of marking. Turner's Mr. Beck is a fine and successful new variety. All amateurs should aim at eclipsing such flowers as this. CARNATIONS AND PICOTEES must be well watered in dry weather (if in pots); the evening is the most proper time. PINKS.—As they advance, reduce both stems and buds, according to the strength of the plants. Plant out Dahlias, and attend to the general routine.

HARDY FRUIT GARDEN.

PEACHES AND APRICOTS ON WALLS.—Proceed with the final disbudding of these, leaving no more shoots than can be laid in without crowding. Where the young shoots seem likely to grow very strong, they should be stopped as soon as they have made from four to six leaves, and from the laterals consequently produced, one or more may be selected, which will generally form good bearing shoots of moderate strength; but if the wood they produce is still too strong, stop again, and continue the practice as long as the tree persists in throwing out strong growing shoots. This moderates the growth in those parts which are too vigorous, and helps to diffuse the sap over the whole tree with greater uniformity. The neglect of timely and judicious stopping of the gross shoots often proves to be the ruin of many a fine tree. Where the Peaches, Nectarines, and Apricots, have fortunately set an abundant crop of fruit, it will be necessary to examine them carefully, and to cut some away where they are too thick. This should be done when they are about the size of Walnuts, as they come in usefully for tarts. Attend vigilantly to the destruction of caterpillars and aphides. Continue to let down the canvas screens at night whenever the weather is wet or cold. Those trees which are protected by evergreen boughs should be gradually released, so that a free circulation of air and the rays of the sun may exercise their influence upon the rapidly-advancing fruit and foliage. If the covering is allowed to continue longer in contact with the branches, it will do injury by overshading. After all is removed, let the trees have a gentle washing with the engine, to remove any cobwebs, loose leaves, or other rubbish, which may be sticking about the walls; being at the same time untidy in appearance and a harbour for insects.

KITCHEN GARDEN.

A cool moist atmosphere should be maintained in the Mushroom-house, and cleanliness strictly attended to; let the hay used for covering the beds be occasionally changed, as it forms a more congenial harbour for insects when allowed to get old and musty. Pay attention to the destruction of woodlice, by laying slices of Turnips to attract them, in addition to which a few toads should be kept on all the beds. The Onions will soon require thinning, and if a sufficient breadth has not been sown, a bed should be prepared for transplanting those into which are thinned out of the principal bed. Make a sowing of the silver-skinned variety, moderately thick, to produce small bulbs for pickling. Give plenty of room to all growing crops, and stir the ground frequently with a fork, to encourage their progress and to keep down weeds. Make successional sowings of all summer vegetables which are of short duration, as Peas, Beans, French Beans, tall Runners, Spinach, &c., and salads of all kinds; also early Cabbages, and a small sowing of Cauliflowers for late autumn and early winter supply. The ground for Spinach crops sown at this season should be rich and deep, or the produce will be bitter and run to seed. Transplant Celery, and water freely, that the young plants may not suffer from the check, or from the drought in very dry weather.

State of the Weather near London, for the week ending May 16, 1850, as observed at the Horticultural Garden, Chiswick.

FISH: *H Seymour.* See the answer below under the head of "Valisneria."

GERANIUMS: *E C W.* The leaves of seedlings are always larger the first year than they are in the second or third.‡

GOLD GRASS: *F.* See p. 302 of our last week's Number.‡

HYBRIDS: *Ciolwlff.* A Fuchsia cannot be crossed with a Ribes. It is necessary in the hybridisation of plants that both should be of the same natural genus. There is no hope of getting a bright yellow Fuchsia. Read the late Dean of Manchester's treatise upon hybrids in the Journal of the Horticultural Society.

INSECTS: *Este.* The larva found in the heart of the branch of the Summer Nonpareil is that of the wood leopard moth; *Gardeners' Chronicle*, 1846, page 236, representing, 1, the

larva; 2, chrysalis; 3, male moth; and 4, mass of eggs. *W.—Essayer.* Your insect found on the Apricot is the caterpillar of the swallow-tail moth (Ourapteryx sambucaria). *W.—W B.* The grubs which have attacked the roots of the Cow Cabbage are the larvæ of the common daddy-long-legs, which had previously fed on the roots of the Grass you have lately broken up. You had better saturate the earth well round each plant with gas-tar water; but as the larvæ are nearly full grown, you must also kill as many of the flies themselves when they begin to appear. *W.— G S W.* Thanks for the reeds, but the majority seem old ones, from which the insects had escaped last year. The larvæ found in cocoons attached to the Rose-shred are those of the Rose antler saw-fly (Cladius difformis). The grubs found in the wine corks died; we shall be much obliged for another supply. They are known to turn to a small Tinea. *W.—H W B.* The insects which have attacked your neighbour's Cucumber plants are the common thrips. Fumigation will certainly destroy them, as well as the fumes from bruised Laurel leaves, but the frames must be made air tight at the time. *W.*

LETTUCES: *B C.* There are no full grown and well blanched Cos Lettuces in Covent-garden market yet. The weather has been unfavourable for their growth.‡

NAMES OF FRUITS: *G C.* The Easter Pippin or French Crab.‖

NAMES OF PLANTS: *J Ellis.* It looks like a bit of Oncidium urophyllum, but such things cannot be named without leaves, &c.—*P.* 1, 2, Aerides affine; 3, Oncidium filipes.—*An Old Sub.* 1, Astelia Banksii; 2, Leucopogon Richei; 3, Melittis melissophyllum. — *Addio.* Pulmonaria virginica. — *W G.* Apparently a white variety of Myosotis sylvatica; the specimen is quite unfit for examination.—*J K.* It is a parasitical fungus called Uredo Rosæ.—*H P G.* The Begonias in gardens are one mass of confusion. Yours is related to B. semperflorens, but distinct. We cannot just now spare half a day for the determination of its real name. It passes current under those of nitida and ulmifolia, both wholly wrong.—*A M.* Spiræa lævigata.—*A B C.* Ribes speciosum. —*Y Y.* Anagyris indica.—*W R.* A dried caterpillar attached by Sphæria Robertsii.—*Y Z.* Polystichum coriaceum. *S.*

PAINTING IRON HURDLES: *M A.* It is said that "the rustier they are the better before the composition mentioned at page 296 is laid on."‡

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

PINE-APPLES: *A young Beginner.* With a little experience you will learn that there is no such difficulty as you are beaten by. We cannot give a lecture upon this subject. Read Mills on the Pine-apple, or Glendinning, or some other writer of authority. We are sorry to see that you have undertaken a task without having been qualified for it by the necessary experience.

RHUBARB: *J W.* There is no room for a difference of opinion as to the treatment of the Rhubarb plant, as it attains a disposition to form for seed. Undoubtedly the flowering stem should be cut down as soon as it is half grown, or sooner.

SASHES: *A Constant Reader.* Mr. Montgomery, Brentford. You cannot use anything better than Atkinson's cement.

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

VALISNERIA: *J F J.* Mr. Warrington's address is Apothecaries'-hall, Bridge-street, Blackfriars.

VERBENAS: *Amateur.* Turfy loam mixed with a little leaf-mould or *rotten* dung and sand, so as to render it light, will suit Verbenas perfectly.‡

MISC.: *G C.* September is the best time for moving large variegated Hollies.‡—*Inquirer.* Apply to Dr. Lankester, 22, Old Burlington-street.—*D Y.* No Orchids can be grown out of doors, except the common hardy kinds. Eggs of silkworms may be obtained in Covent-garden market.‡

SEEDLING FLOWERS.

AURICULA: *G B S.* A promising pip: but we should like to see a truss before we offer any opinion of its merits.*

CEREUS: *M I.* A pretty flower, very much like that of C. crenatus.

CINERARIAS: *G R.* 1, white, faintly tipped with lilac; dark centre. A large clean-looking flower, but different in form. 2, bluish purple, with a narrow rosy circle round the centre; too small, and inclined to reflex.*—1 *c* 1. White centre, broadly margined with purplish lilac; too small and inferior to many sorts already in cultivation.*

EPIPHYLLUM: *T K.* A pretty rosy pink variety of E. truncatum.*

PANSIES: *J F O.* 1, white ground, top petals purple, lower ones margined with the same colour; eye large and bold, showing itself in the side as well as in the bottom petal; smooth, but rather long. 2, a flower of the same class, and similarly marked; purple much darker than in 1; substance not so good. 3, yellow ground, worthless.*—*P.* A substance not so good. 3, yellow ground, worthless.*—*P.* A yellow-ground flower in the way of Hooper's Masterpiece, but not so good.*

POLYANTHUS: *J W.* Your seedling is deficient in many points which it ought to possess in order to be a good florists' flower. Instead of being stained in the centre with dark yellow like a Cowslip, it ought to have been either pure lemon or orange, and the lacing does not strike through the centre of the petals to the eye, which it should do. It is large and striking, but worthless as a show flower.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

FOR TURNIP SOWING.

SUPERPHOSPHATE OF LIME AND CRUSHED BONES are the best and cheapest Manures for the Turnip Crops, and may be had in any quantity on application to Messrs. HUNT's Manure Works, High-street, Lambeth, London.
Established 1816.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
London, May 18.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	£10	0 0
Clover Manure, do.	...	11	0 0
Turnip Manure, do.	...	7	0 0
Superphosphate of Lime	...	7	0 0
Sulphuric Acid and Coprolites	...	5	0 0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MABE FOTHERGILL, 201a, Upper Thames-street, London.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.
Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot.

HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.
Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.
*** A liberal Discount to the Trade.
W. HILL, Horticultural Works, Greenwich.

HYDRAULIC ENGINES, WATER RAMS, &c. on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.
Direct to JOHN LEGG, Cheltenham.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).
It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*
The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip	...	per lb. 0*s.* 8*d.*
Ditto ditto		per qt. 1 0
Skirving's Liverpool Swede ditto, per lb., 8*d.*		per qt. 1 0
Laing's Improved ditto ditto, per lb., 8*d.*		per qt. 1 0
Purple-top Scotch ditto ditto, per lb., 8*d.*		per qt. 1 0
White and Green Globe per lb., 6*d.*		per qt. 0 10
White Belgian Carrot		per lb. 0 10
Yellow Globe Mangold Wurzel		per lb. 0 8
True Italian Rye-grass		per bush. 7 0
Best English Red and White Clover		per lb., 5*d.* to 0 7
Large Cattle Parsnip		per lb., 1*s.* to 1 6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)
PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30*s.* per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.
All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.
Railway and Steam communication to all parts of Great Britain and Ireland.
For Catalogues and further particulars apply to
WILLIAM E. RENDLE & CO., Union-road, Plymouth.
ESTABLISHED 1786.

TURNIP SEEDS.

DUNCAN HAIRS having personally superintended the selection and growth of the Turnip Seed he offers, can with confidence recommend them as genuine. Likewise, AGRICULTURAL SEEDS of every description, of first-rate quality and low in price. Catalogues with prices free.
Garden Tools, Nets, and every article connected with the trade wholesale and retail.
Seedsman and Florist, 109, St. Martin's-lane, Charing-cross.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.
The terms of the School can be had on application either personally or by letter.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.
Works, Sumner-street, Southwark-bridge-road.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 113, Fenchurch-street, and 8, Billiter-street.
N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12*s.* to 13*s.* per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 113, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.
N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3*l.* 5*s.*, to be had of the Maker, Mr. JOHN DAVIS, Optician, Derby. The above is securely packed and sent to any part of the empire.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.
PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.
G. BELL and Co., 2, Wellington-street, Goswell-street, London.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;
Deer, Sheep, and other Hurdles;
Hare and Rabbit-proof Wire Fencing;
Iron Bedstead Makers to the Board of Ordnance;
And Government Contractors.
The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The show-rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.
N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.
All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The GENERAL MAY MEETING will be held at the Society's House in Hanover Square, on WEDNESDAY, the 22d inst., at Eleven o'clock in the forenoon.
By order of the Council,
London, May 1, 1850. JAMES HUDSON, Secretary.

NOMINATION OF JUDGES.—On or before the General Meeting on the 22d of May, Nominations of Judges for Stock or Implements, at the Exeter Meeting, will be received from Members of the Society, who are requested to certify, from their personal knowledge, that the parties proposed are qualified and willing to act as Judges for the particular class for which they are respectively recommended, and who are unconnected with any Exhibitor of Stock or Maker of Implements, and have no direct personal interest in the Stock exhibited, as the breeder of any of the animals upon which they may be called upon to adjudicate.

RENDLE'S CHEMICAL PLANT MANURE.—We have just received the following letter from Capt. JAMES WILLIAMS, R.N., Newport, near Barnstaple.

"Newport-terrace, Barnstaple, May 14, 1850.

"Sir,—I acknowledge the receipt of another supply of your Chemical Plant Manure, and I have very great pleasure in informing you of the beneficial effects I have found it produce on my plants in general. I am certain a short trial of it will be satisfactory to any person using it. I find my plants *strong and full of flowers*, particularly my Geraniums, which are grown in very small pots, producing now, at this time, *fine trusses of flowers, large*, and *their colours clear*. On my Calceolarias it has an *astonishing effect* in the produce of flowers, both in quantity and size; with regard to Petunias the same. I now use it in the compost of all my greenhouse plants. I have so far been successful in the quantity I have used—one pint of manure to two pecks of compost; and as it is *inexpensive*, I wish you a successful sale, and trust that your customers will be as well satisfied as I am.

"I remain, sir, yours truly, JAMES WILLIAMS."

"P.S. I shall most assuredly recommend all my friends to use it."

Samples can be had gratis, by enclosing six penny postage stamps to pay the postage. Sold in tin canisters, at 1*s.*, 2*s.*, and 3*s.* 6*d.* each, warranted to give satisfaction, or the money will be returned.
Apply to WILLIAM E. RENDLE & Co., Union-road, Plymouth.

The Agricultural Gazette.

SATURDAY, MAY 18, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	May 22—	Agricultural Society of England.
THURSDAY,	— 23—	Agricultural Imp. Society of Ireland.
WEDNESDAY,	— 29—	Agricultural Society of England.
THURSDAY,	— 30—	Agricultural Imp. Society of Ireland.

WE have repeatedly warned our readers of the risk they run by purchasing cheap guano; but, notwithstanding all that has been said on the subject, there are still so many short-sighted as to persist in cheapening down this and other artificial manures, until it has become a regular trade to supply an article of which the principle recommendation is its low price. A summer or two ago, at a sea-port town, we saw a manufactory of cheap guano in full swing; there was a pug mill at work, mixing the Patagonian and chalk together, the result being a beautiful sample of *Peruvian guano!*

During the last week we have received intelligence of another manufactory of this kind, so busily engaged that the men are working night and day. The following is an analysis of the result, alongside of which we place an analysis of Peruvian guano, for the purpose of comparison:

ADULTERATED GUANO.		
Organic matter, yielding 7.36 ammonia		14.96
Earthy salts, containing 14.28 phosphate		17.22
Water		9.54—41.72
Adulterations:		
Common salt	13.52	
Brown ochre	44.76—58.28	
Total		100.00
PERUVIAN GUANO.		
Organic matter, yielding 19.48 ammonia		43.38
Alkaline salts		13.46
Earthy salts, containing 25.00 phosphate		28.50
Insoluble matter		2.16
Water		12.50—100.

The price of the former is 7*l.* per ton, that of the latter is 10*l.*; but when the amount of adulteration is taken into account, the

Adulterated guano costs about	... ...	15*l.*
Peruvian „ „	... ...	10*l.*

The folly of thus attempting to get guano *cheap* cannot be more strongly shown. Men will have, in fact must have, a profit upon their transactions; and if farmers will persist in only giving a certain price for guano, dealers will always be found who will undertake to satisfy them; and well they may,

for in this adulterated guano the brown ochre, with which it is mixed, costs little enough, leaving the fraudulent dealer a much greater profit than the honest merchant is satisfied with.

The party most to blame in this matter is the farmer; the chemical analysis by which the fraud was discovered in this case cost about 1*l.*, so that where any quantity is needed, that cannot be a serious consideration. Those farmers who cannot afford this, must go to dealers of established character, and, asking for the genuine article, they must pay the best price. By doing so, they may be perfectly satisfied that they secure a cheaper article than any discernment of theirs, unassisted by chemical analysis, could ever have effected.

One word to certain eminent chemists, to caution them against the extremely careless way in which many of them allow their names to be used. We have now before us a printed copy of an analysis, with the name of one of these gentlemen attached to it, by which guano has been sold by a very extensive dealer for upwards of two years, with what approximation to truth our readers may judge. We would also recommend that all analyses of guano should be calculated on one principle, so as to show, as in the instances we have quoted above:—

In 100 parts—1st, the organic matter, and the quantity of ammonia it yields; 2d, substances soluble in water, or alkaline salts; 3d, earthy salts or substances soluble in acid, containing phosphates; 4th, insoluble matter; and 5th, the quantity of water.

An analysis professing to give more information than this is a waste of time as far as the farmer is concerned. But, if all analyses were given in the above form, they could be more easily and more accurately compared than under the present system.

We have little hope that our repeated warnings will be attended to. The temptation of apparent cheapness is too great to be resisted, until the subject is either better understood, or until the farmer has found that low priced guano invariably produces inferior crops.

The farmer who requires a small quantity can only protect himself by dealing with men of known good character. We advise those who farm largely to ask for a sample from the tradesman, and when the bulk arrives send it with a sample selected by himself to a professional chemist, whose practical knowledge is sufficiently advanced to be able to speak not only to the comparative value of the two samples, but also to an approximation of the market value of either.

The low priced guano is not only actually dearer than the high priced sample when the quantity of fertilising ingredients each contains is taken into consideration; but the farmer also finds that his crops are wofully deficient when these cheap manures have been used. There are, surely, a sufficient number of chances against a good crop without the farmer adding to them by the use of inferior manures; and as this is the season when the principal purchases are made, we cannot too strongly urge upon them to abandon their present "*penny wise and pound foolish*" practices.

Unless some new source of guano be discovered, this valuable manure will gradually become very scarce, and the extensive system of fraud and adulteration now carried on will also tend to bring it into disrepute. By satisfying farmers that there are other sources of fertility besides the dung heap, it has, however, effected a revolution in practical agriculture undreamt of before its introduction. A new species of manufacture has sprung up to supply this growing deficiency, which promises to be of great importance not only to agriculture but also to the general trade of the community, and many who have entered this new trade seem to be actuated by the wish of making sales for ONE year only—one sample of superphosphate which we saw turned out by one of these gentry, actually contained 80 per cent. of gypsum; of course he could not expect any of his customers to come back to him the next season. A few years will, however, weed out such men, and those manufacturers who have been careful to manufacture a good article from the first, will speedily have the market to themselves.

We again reiterate our warning to farmers to be careful what they purchase, in the name of artificial manures. The character of a respectable tradesman, and the assistance of the chemist, are a sufficient protection if he will but avail himself of them.

"How can he get wisdom that holdeth the plough, and that glorieth in the goad, that driveth oxen, and is occupied in their labours, and whose talk is of bullocks?" Such, in ancient times, was the exclamation of the Hebrew sage; and the same enquiry may again be demanded of the present age with a similar hopelessness of solution. How are mental acquisitions to be obtained by the toiling labourer who for 12 hours daily is fagging in the field; who "giveth his mind to make furrows, and is diligent to give the kine fodder," instead of devoting his intellectual faculties exclusively to other objects which mechanism is unable to perform; and who has but little opportunity for the satisfaction of his mental appetite. While the sinews of a man are overstrained, and his nerves fatigued in daily drudgery, what vigour or inclination can he have for exercising and informing his mind? Education cannot be expected to develope with rapidity the mental capacities of the poor until business shall shorten its demands upon their time and energy; for while the working-men of Britain are entitled to honour for the triumphs they have in so many instances achieved over the ruthless obstacles that beset their progress, the far greater part have failed in strength or courage to destroy the lion difficulties in their path:

"Chill penury repressed their noble zeal,
And froze the genial current of the soul."

It is true to some extent that "the wisdom of a learned man cometh by opportunity of leisure, and he that hath little business shall become wise." But leisure alone will not suffice. Of all employments, that of farming is supposed to give the largest periods of cessation from labour; and yet agriculturists generally, at least of England and Ireland, are not usually classed as men of cultivated intellects and brilliant attainments. Poets discourse on the power of a constant familiarity with the operations of nature, such as is found in a rural life, to excite reflection and elevate the mind. But how then is it that the great mass of the farmers who enjoy such frequent and lengthened respites from the turmoils of business should be proverbially feeble and contracted in their mental aspirations and acquirements? How comes it that lectures, discussions, and public periodicals figure so diminutively in their hands; and how is it that while the charms of the chase, the glories of game, and the perfections of their beasts of sport form an absorbing topic at market meetings and convivial gatherings—the revelations of science, the birth of new truths, and the great questions which concern the welfare of humanity are comparatively so little esteemed? Leisure for study is not so much needed as a perception of the value of knowledge and an inclination to possess it. It may be said that we libel the class; but, we ask, are agriculturists generally considered as "readers;" do not the cheering glass and comfortable pipe or the desultory fireside conversation engross too many of the evening hours? We may have several useful agricultural magazines and papers, but these are mainly supported and purchased by the more opulent farmers and landowners; and, as a proof of how little the great bulk of the farmers read of agricultural information, where, we ask, are our farmers' penny periodicals circulating their 10,000 per week? Again, another testimony to the truth of our remarks is to be gathered from the lips of the farmers themselves: do they not repeatedly complain of the unpractical nature of communications in the journals?

It is common to hear the contents of an agricultural periodical summed up thus—"there are a few letters on cattle-feeding after a fashion which everybody knows, practises, or ridicules; a paper or two describing the farming of some innovating amateur; an article on some new-fangled notions of draining; a few pet opinions respecting foreign competition; and a one-sided estimate of expenses and profits—but nothing of real and practical utility." Now, why do not these men themselves write "practical papers?" The fact is, their complaints are merely an evidence of the unliterary tastes and habits of their class. Those who would claim to themselves the distinction of "practical" farmers are in general too unfamiliar with the pen to take the rural journalism out of the hands of the "fancy farmer" or son of science. The lawyer and physician seem to possess more favourable opportunities than the farmer for studying the "theory" of their professions; because their business is much amongst books and papers, and they cannot acquire an adequate knowledge of their practice without reading, whereas farm operations may be directed without the aid of written information. The learned professions discover past theory in books of cases, &c.; the farmer finds it in the modified farm practice of the day. The habits of reading and writing are intimately connected with the one variety of pursuits, and widely severed from the other: hence the lawyer and medical man are accustomed to rest their belief and knowledge upon recorded facts, while the farmers are chiefly influenced by improvements performed before their eyes. But cannot these trammels of habit be broken through: is the mighty power of the press to be limited in its usefulness by the uncongenial tastes of men? If there be any truth in chemical and geological science, agriculture will progress in proportion as the principles and facts of these sciences are known and understood by the cultivators of the soil; and, by what means are those truths to be disseminated if not by the press? If there be any advantage accruing from the publication of discoveries and the discussion of opinions, then is the agricultural press destined to effect an entire renovation of our art.

The necessity of multiplying the vehicles of information, and the importance of employing every means by which printed statements may be made valuable and convincing, are points upon which many columns might be written. Undoubtedly one of the causes which have operated to the hindrance of agricultural improvement has been the broken channel of intercourse between mind and mind. The incongruous facts and fragmentary evidence collected by dispersed and scattered individuals have been preserved in publications whose scanty circulation could not exhibit them sufficiently before the public eye. The consequence has been that, while private dogmas have been many, definite generalised results have been rare: agriculture as a science is still unfounded upon secure fundamental truths. If, however, the observations and speculations of all could be instantly placed before the attention and criticism of all, by means of cheap papers universally circulated, agriculture would no longer hesitate so timorously in adopting new truths, and would be less dilatory in the application of proved principles.

We have many writers and readers among the agricultural public, but the smaller occupiers, and indeed a large portion of those "who ought to know better," have not fully admitted the idea of deriving assistance in their art from the pages of the press. Removed from that "mental attrition" which sharpens, warms, and stimulates the residents in towns, the more isolated agriculturists probably require the urgency of circumstances to impel them toward completer knowledge for relief. It may be that the present pressure will turn us from our crippled resources to that certain fountain of success, and lead us to demand a wider diffusion of information. *I. A. C.*

GUANO.

Return to an order of the honourable the House of Commons, dated 14th February, 1850;—for, an account "of all guano imported into the United Kingdom, in each of the years 1838 to 1849, inclusive; distinguishing the quantities imported from each country, respectively."

Previously to 1841, when it was first specifically charged with duty in the tariff, the article of guano was entered at the custom-house under the general denomination of "goods not particularly enumerated." No account of the importations can, therefore, be rendered for the years 1838, 1839, and 1840. *W. Irving, Office of the Inspector-general of Imports and Exports, Custom-house, London, 23d March, 1850.*

Home Correspondence.

Prices of Drain Cutting.—In a recent number of the *Agricultural Gazette*, I saw a request to correspondents, to forward to the editor the price which they pay, in different parts of the country, for cutting and filling in drains. Believing that such information may be very useful to the public, I beg to inform you that I have till this year been in the habit of paying for clay cutting, *i.e.*, anything which will cut with a digging tool without stocking, for 3 ft. deep, 5*d.*; 3 ft. 6 in., 6*d.*; 4 ft., 7½*d.*; per perch of 5½ yards; this year I have reduced each ½*d.* per perch, and pay 4½*d.* for 3 ft.; 5½*d.* for 3 ft. 6 in.; 7*d.* for 4 ft., including everything; and the men have this season, I consider, earned from 10*s.* to 12*s.* per man per week all round. Where stocking is required, it is impossible to fix any general price, as all must depend upon the obstacles to be overcome. I have paid 9*d.* and 1*s.* 4*d.* in the same season for making 4 feet drains, and the men did not earn so much at the latter as the former. *J. Curtis Hayward, Quedgely House, Gloucester.*

Mr. Caird, of Baldoon, and his Reviewers.—Knowing Galloway well, and the position Mr. Harkness once held as an authority in all matters connected with farming in Wigtonshire, and Rhins of Galloway, I think his reply is sufficient to dispel all doubts respecting Mr. Caird and his agricultural skill. I question if a more intelligent and enterprising body of farmers are to be found in Great Britain than those located in the districts adjoining to Baldoon, and Mr. Caird is universally spoken of by them as a first-rate farmer and worthy man. On the first appearance of Mr. Caird's pamphlet on the high farming at Auchness, the agricultural world was puzzled at some of the statements made in it; and to this day many farmers in England believe that it contains lies from beginning to end. The quantity of manure made was the great stumbling-block to the unbelievers; but did they know that, on farms near the sea-coast, on the west of Scotland, sea-weed is to be procured in great quantities, and that it soon rots every particle of straw or rubbish mixed with it, their unbelief would soon vanish. In Ayrshire, on farms near the sea-shore, I have seen heaps of sea-weed piled up in a single day, after a storm, that would have surprised any one unacquainted with the locality. This manure, when well made, that is, mixed with stable litter, is always found the most powerful for raising every kind of green crop. I have never seen larger Swede Turnips, Ox-Cabbages, or Carrots, grown in any county in England than those to which this manure was applied. The quantity of Potatoes grown at Auchness, and the profit realised from them, was another bugbear. The soil there being newly reclaimed moss, which has always been the freest from disease, was, no doubt, one cause of the tenant at Auchness growing so many Potatoes; but no crop, on any description of soil, is so profitable, if they are properly managed. It is true that if there was no rot, and that every farmer grew as many in proportion as in the Auchness case, that prices would soon find their level, and that Potato growing would be as unprofitable as Wheat growing; but this is no answer to the argument, for the tenant at Auchness found that many were deterred from planting their usual quantity for fear of disease, and he calculated on high prices in consequence. Every farmer, according to his individual case, ought to do the same with any description of crop, and discriminate which one would pay him best for his skill and outlay. Having spent all my life in the deep and proper cultivation of the soil, I, for one, firmly believe that there is no limit to increased production in this country, that is, when capital and skill are properly applied. *T., Notts.*

The New Churn.—How to solve a doubt. Two gentlemen, extensive dairy farmers in the neighbourhood of Stony Stratford, having expressed a wish to see Anthony's patent American churn in operation, being somewhat sceptical about the merits of new inventions, requested to be allowed to bring their own cream and try the churn at our place of business in Newgate-street, which we at once consented to, and accordingly, on Saturday, they made their appearance, with somewhere about 4 quarts of excellent cream. We handed them a 6 lb. churn, with the use of a man to turn the handle, and they proceeded to business. The cream was put in at about a temperature of 58°; the operation commenced, and in exactly 6 minutes 3 lbs. 10 oz. of first-rate butter was obtained, much to the satisfaction of the doubters, and to the delight of several gentlemen who had dropped in during the process. The butter was washed in the churn, the butter-milk being squeezed out thoroughly by the dasher, a little salt added, and thus without human hand ever touching it, it was prepared, and with a slice or two from a nice cottage loaf, eaten with much relish by all present; but the following certificate will attest their opinion:—"We whose names and addresses are hereunto annexed, being desirous of witnessing the operation of Anthony's patent American churn, brought about 4 quarts of our own cream, and witnessed the working of the churn, which produced from that quantity, in 6 minutes, 3 lbs. 10 oz. of excellent butter, of exceeding good flavour, firm, and hard. The temperature of the cream, when put in, 58°; and we most willingly bear testimony to its merits, considering it a great and useful implement as a butter-making machine: Thomas D. R. Rolch, Drumlanford House, Ayrshire; Peter Murdoch, Longbank, Renfrewshire; W. G. Duncan, Bradwell, Stony Stratford; Joseph Peers, Plasnewydd, Denbighshire." It is most remarkable that this certificate contains the opinion of England, Scotland, and Wales; and we feel the greatest satisfaction in having it in our power to introduce to the public so useful, so thoroughly good and economical a butter-making machine as this churn, the merits of which are placed beyond all doubt. *Key and Mitchell, Sole Agents for the Proprietors, 97, Newgate-street.*

Public Houses.—Gentlemen are making great and commendable exertions to get the Beer Bill repealed. Efforts nearly of the same magnitude and earnestness were made to obtain its enactment 19 years ago. Both, I doubt not, have sprung from the same laudable motive of conferring an advantage upon the working classes. But both, I feel assured, involve one great error, which is, ignorance of the nature and properties of the article called beer, which these houses are licensed to sell. If the article is good, why either interdict its sale, or limit the number of places in which it is sold? If the article is bad, and injurious to those who use it, why license its sale at all, either in beer-houses or houses kept by licensed victuallers? But if licenses are granted, merely in deference to public opinion, yet limited, in order to lessen the evils produced, why not excite public opinion against the liquor, by constantly stating that the evils complained of arise from the liquor itself. Here I think the agitators for closing beer-shops are greatly at fault, for in none of the appeals have I yet seen this point insisted upon. There must be some strong reason why beer-shops are disorderly and coffee-shops perfectly quiet; why the sale of malt liquors should generally produce vice and crime, while the sale of milk is harmless in its effects. Let us have the same neighbourhood; let us have two houses adjoining each other, and exactly the same company, one selling coffee and the other beer, and you shall find the effects upon the company so different as at once to convince any impartial person that the fault is in the liquor, and not in the men who drink it. It was the long-cherished opinion that malt liquor was nutritious and useful to the working man, which led many well-meaning persons to advocate the Beer Bill; and I fear the same favourable opinion is still cherished even by some of those who are seeking its repeal, and that the present movement does not spring from a conviction that working men (and still less those who are not working men), are injured by taking this beverage, but that it should either be brewed at home or taken in places under strict magisterial surveillance. Now if it be demonstrable, as I maintain it is, that malt liquor (so called) is injurious to the human system, then the original opinion urged for opening beer-shops is at once destroyed, and it would only remain to be decided how far in deference to existing prejudices it should be sold at all, and under what restraint. Beer produces exactly the same physical effect when sold at the "licensed victualler's" as at the "beer-shop;" and any difference in its moral effects arises from the influence of other restraints. One of the fundamental principles of the Temperance reformation is, that it is not the shop but the drink that is in the fault; that it is not the incautiousness of the moderate drinker, but the drink that produces that incaution, and that consequently the evil to be guarded against is, not the abuse but the use, one being certain to produce the other, so long as man's physical constitution remains what it is. Alcoholic liquor has the same effect wherever taken; but the manifestations of bad drink are no doubt restrained by the character of the company in which the drinker is found; and hence the evils of drinking are not so palpable in the licensed victualler's establishment as in the jerry-shop. I hope my Lords Harrowby, Ashley, and others will not lightly pass over this view of the subject, but institute an inquiry as to what this long and far-famed "malt liquor" is; and if they should become convinced that the fault is not in the man but in the liquor, they will have a ten-times stronger case with which to go to Parliament for the refusal or limitation of licenses to sell this article. I will attempt briefly to show what this far-famed national beverage is. I only know three properties for which beer can be recommended; first, to quench thirst; secondly, to give strength; and thirdly, to afford a stimulant. That it cannot do the first, I think is now conceded on all hands. It creates thirst, and the stronger the liquor or the more a man drinks, the thirstier he becomes. The nearer it approaches water, the less thirst it creates; and hence, for allaying thirst, the beer at 1*d.* per quart is far superior to that at 6*d.*; but water is decidedly better than either. Then comes the question, does it give strength, or does it merely excite the system?—in other words, is it nutritious, or is it merely stimulating? That the latter are its properties is most obvious; and to this we have now the united testimonies of all classes of workpeople. The less ale, the more labour is performed; the more ale, and the less work is done. Ale stimulates for a short time, but does not strengthen; and there is a great difference between stimulation and strength. We may blow up the fire with the bellows, just as we may excite the nervous and arterial system by the spirit from malt (alcohol); but it is only by solid fuel that we can sustain it. The Saturday night's glasses, even when not taken to great excess, instead of producing strength for Sunday morning, as we might expect according to the old theory, are the cause of languor, inactivity, and depression, and the whole of Sunday is scarcely sufficient to throw off their effects. It is good food, not stimulating liquids, that is to sustain the human system. But if the honest experience of thousands, often told, is not sufficient to convince, we have only to attend to the process of ale-making to learn at once that the sole object in every process is not to produce a feeding, but a stimulating liquor. For instance, Barley is the only ingredient used which can feed, and as the nutritious properties of ale are only in proportion to the quantity of this which it holds in solution, we shall see by an impartial inquiry that it cannot possibly be a feeding liquor. In a gallon of ale, we have, first, above three quarts and a pint of water; secondly, about six ounces of malt spirit (whiskey); and, thirdly, only about nine ounces of the worst parts of the Barley, including a few particles of Hop. That which is really food, and which alone can give strength, comes actually short of a single pennyworth in a gallon. If we go step by step into the manufacture of malt liquor, we shall not be surprised at this result, and we shall also at once be convinced that notwithstanding the high opinion often expressed of its nutritious properties, the sole object of every process in its manufacture is to produce, not a feeding, but an intoxicating beverage. For instance, in the first place, there is not more than five-pennyworth of Barley used in making a gallon of ale of ordinary strength, and of this five-pennyworth, above four parts are either abstracted or converted into spirit in the process of malting, mashing, fermenting, and fining. The maltster, for instance, first takes this Barley, and, by allowing it to lie together in a wet state, forces it to germinate; that is, he brings it into a similar condition to the sprouted Wheat which stands in the fields during a wet and sultry season. After sprouting the Barley, and then drying it on a kiln, the sprouts are taken off by a machine, and sold as "malt combs." The Barley, nearly 50 lbs. to the bushel, is reduced, when malted, to 38 lbs.: this is the first stage of abstraction. The brewer next takes the malt, but does not boil it, as any one would whose aim was to produce a feeding liquor; no, he makes an infusion which he calls "mashing," that is, dissolving the saccharine matter. This liquor, called "sweet wort," he draws off as carefully as possible, and most of the solids remain behind, being what we call "grains," sold for the purpose of feeding cows and pigs. This is the second stage in which there is a considerable loss as to food. Up to this point the malt liquor is perfectly innocuous; it contains no spirit, and could not by possibility intoxicate. It is in the next, the fermenting process, that all the mischief is done. In this, which is the first process of vegetable decay, the sugary matter becomes changed into alcohol and carbonic acid gas, and acquires the power of intoxicating. This is the third stage in which a loss of food is sustained. Next, in order to make good ale, fine and sparkling, is the "fining" process; and by this nearly all the particles of the Barley which had not been previously appropriated, sink, and are called "barrel bottoms." These are also disposed of in various ways, and hence this is the fourth loss. It is an indisputable fact, that the five-pennyworth of Barley used in brewing two shillings' worth of ale, loses in these processes full four-fifths of its nutritive properties, for the whole scheme of brewing is to make a stimulating and intoxicating beverage; and provided this property be secured, the less food it contains, and the higher it is estimated. The basis of all spirit is saccharine matter, or sugar. The malting process is to develope more sugar, the mashing to wash out this sugar, the fermenting process to convert this sugar into spirit, and the fining to rid the liquor of the dregs of the Barley, in order that it may be as clear as possible. I may just add that the Hop is used to improve the colour, to impart a bitter to the flavour, and to preserve the drink from running into the acetic fermentation; it is a narcotic, but contains nothing in the shape of food. Indeed, ale is little more than whiskey and Hop-water. While men are, therefore, trained to drink beer under the delusive notion that it is either calculated to quench their thirst or increase their strength, drunkenness is sure to continue; and the only rational way of curing the evil is, honestly to explain to the operatives its true properties. It is from "malt liquor" that our whiskey and gin are distilled; and a tumbler of spirit and water, of equal alcoholic strength, is scarcely as injurious as a tumbler of ale. I would, therefore, most respectfully submit these views to my Lords Harrowby, Ashley, and others, so that they may urge public opposition to the Beer Bill upon the broad and defined principle that beer is not a nutritious, but an intoxicating drink; that its use ought to be discouraged in all places, as well as in beer-shops. And I cannot help adding that, to be consistent, everyone who agitates for the repeal of the Beer Bill, should unhesitatingly see that he has neither a beer barrel in his cellar, nor ale or porter upon his table. *J. Livesey, Preston, April 18.*

The Coming Generation.—If means are not taken to instil into the minds of the young (both male and female) habits of industry, we shall leave a fearful legacy to the next generation, in the way of an idle and discontented race of work-people. There are in England thousands of acres of land capable of producing something, now barren, and there are also thousands of acres which would yield double by the expenditure of tough muscle and sinew upon them. Does it not appear akin to folly, to use no harsher term, to waste capital &c., the shape of human labour, by feeding in indolence, and under the name of charity, an enormous amount of able-bodied beggars and paupers. These could support themselves if properly managed, and under the direction of district inspectors, receiving small salaries; who would regulate the machinery of a society, to supply work to those who are able to contribute their share to the riches of the country. The expenses to be defrayed by voluntary subscription, which would not amount to so much as is now given in abused charity. Do not let me be mistaken, I should be the last man to close either

the heart or purse strings against the call of real distress and misfortune; but I do maintain the indiscriminate dispensing of alms is most mischievous. Inquiries amongst those who are well acquainted with the habits of trampers would soon convince the kind hearted of the impositions practised upon them, deceit gloried in, when the culprits are carousing at night, and recounting their success, and the manner of cheating the unwary. I must confess, at one period, to have been deceived as much as anybody, but having lately taken the trouble to look after those whose stories appeared to be most lamentable, my eyes have been opened to the folly of throwing away money upon sturdy beggars, which might be more advantageously spent on hard-working men and their families. It is extraordinary how little influence the parents of poor children have over them, and how careless they are in taking advantage of the education the offspring receive in parochial schools. The heads of families scarcely ever dream of exercising their authority, and compelling obedience on the part of their children; indeed they appear almost to fancy the mechanical part of reading and writing is quite sufficient to provide them with bread in after life. What crime and misery might be prevented, by attending to the common duties of father and mother, which are so neglected! *Falcon.*

Potatoes.—It would be most interesting to farmers and gardeners if some scientific persons would ascertain the analysis of Potatoes under various circumstances: 1st, when thoroughly ripe and fresh from the soil, after drying two or three days; 2dly, after having been allowed to heat in a bury; 3dly, when they have sprouted half-an-inch in the spring, previous to planting; 4thly, the same description of Potato kept under cover during the winter, and turned frequently, to prevent both growing and heating. The last will probably prove the best seed, and produce the cleanest and most abundant crop, if planted early. I before mentioned having planted my crop of Potatoes, in 1849, before the end of February; they have kept admirably—during the late winter not a bad one amongst them. In 1848 I lost half my crop, pursuing the old system of placing the Potatoes in heaps, and setting them late. *Falcon.*

On Storing Turnips.—I am satisfied, from some years' practice, that Turnips may be taken out of the ground without in any way injuring them, by a much less expensive method than is usually adopted. I may remark, however, in passing, that unless it be in situations which render it necessary to have the Turnips removed at an early period, to make way for another crop, or some other cause, I do not think either the land or the Turnips are injured by allowing the Turnips to remain in the ground during the months of winter, or as long as they are in a dormant state. Until signs of vegetation appear, they neither waste themselves nor injure the land. On the contrary, with a little earthing up, to keep off severe frost, I think they preserve their juices and freshness better in the soil than in any heap in which they may be stored. To return, after this short digression, I proceed to state my mode of taking Turnips out of the ground. A few women (more or less, according to the size of the field) go along the Turnip drills, and with the common hoe which is used for hoeing Turnips, cut off, in fresh and dry weather, the whole of the Turnip leaves at their junction with the bulb, and which they do with wonderful neatness and expedition. When the Turnips are thus deprived of their leaves and tops, a ploughman with a pair of horses and a common plough (without its mouldboard), go along the drills and with a slight furrow turn the Turnips over on their sides, which at the same time cuts off great part of their tap roots. In the course of a day or less after the Turnips are turned over by the plough, the earth about the base of the Turnips, if the weather be dry, will become dry also. A pair of harrows drawn by a pair of horses, is then put on the field, and the field is first harrowed with a double strike of the harrow along the drills. This operation, or at most another double strike with the harrows, shakes the earth from the Turnips. Next a few women go along the field, and throw the Turnips into carts, in which they are conveyed to the homestead, and stored in the usual way. In this manner a large field of Turnips may be raised and carted to the farm steading in a very short space of time, and at comparatively little expense. The chief point to be attended to is, that the operations be performed only when the weather and soil are dry. Should any one still wish, however, to continue the present plan of topping and tailing Turnips with a knife, he will find that much labour may be saved by adopting the first part of the plan now recommended, namely that of first raising the Turnips from the ground by the plough, and then shaking the earth from them with the harrows. *A Turnip Grower, Elgin, April* 30.

Foreign Correspondence.

Berlin, *May* 11.—Nothing in the farming line has pleased me so much in point of general appearance as that part of Westphalia lying between the towns of Hamm and Minden. Both soil and cultivation are far more pleasant to an English eye than Belgium. It is equally unenclosed, but the soil has got some colour and texture in it, either of which it is almost impossible to describe, in Belgium. A white powdery sand that seems never to *mix* with the dark doughey clay that lies under it, added to the excessive and unvarying flatness, makes a great part of the latter country as cold and unpleasant to the eye as it is strange. The patchy style of cropping too—so small a pattern in so large a carpet—makes one very far from wishing that English farming may be ever like it in *all* respects, at least. But Westphalia is more cheerful. A range of distant hills on either side gives a frame to the picture, which is drearily deficient in the other. The colour of the soil is that of the new red-sandstone. The culture has the same style of high finish that you see in Belgium; but the implements! they hardly deserve the name. In one place I think I saw at least twenty little wooden ploughs at work, near and distant, drawn each by a *single* bullock, with a boy guiding by the *single handle.* The wonder is how such work is accomplished by such tools. The Rye-crop is the great favorite here, and no cheapness of Wheat flour (and it is cheap enough at present) is likely to make any change in the local consumption. It is equally relished by rich and poor, only in different quantities: the latter consuming and preferring it, alone, the former using it much as oat-cake is eaten in Scotland, and brown bread in England. It is baked in enormous loaves—a yard long—and being slightly fermented before it reaches the oven, acquires a half-sweet half-acid flavour, which the German palate does rejoice in, most unfeignedly. It is darker colored than gingerbread: and indeed if you can fancy a jolly compound of the latter with heavy brown bread with the bran in, to the bargain, the whole gone a little sour, you have not a very distant notion of this far-famed 'Pumpernickel'; which you will be pleased to masticate respectfully, and keep a due control over the nerves of your face, if you regard popularity or the credit of a man of taste. They recommend you to *begin* with it, as a sandwich, between slices of 'common' bread, and so proceed to better acquaintance, as, like many 'good things' it is apt to make the waistcoat sit a little uncomfortably if *indulged in too freely at first!* Like all ancient and well established nationalities, it is a delicate subject, however, to joke upon: and I merely throw the hint out for the benefit of those whose compassion for 'the poor foreign peasant eating brown rye-bread' might chance to meet with the sort of thanks encountered by those who interfere between a man and his wife. Great fears are entertained for the crop this year, owing to the cold and backward spring. Everywhere that I have seen it, it looks cut by the frost, and reminding one of the phrase sometimes applied to Wheat, of 'standing on one leg.' It is sown in such quantities that a failure would be very severely felt, and would act upon the price of Wheat very extensively, From the accounts from Stettin, it seems to have already begun to do so, at the ports.

The greatest breadth of Wheat, and the most forward, I have seen, is in the immediate neighbourhood of Magdeburg, a remarkably rich country, considered the best corn-land in Germany. The Elbe which carries its produce down to Hamburg, is kept equally hard at work in grinding it, for the river is full of water-mills *at anchor:* that is, a couple of barges fast-moored with an immense wheel between them, which above and below the bridge at Magdeburg make the stream pay toll in passing at a pretty handsome rate. Besides Wheat-grinding, there are two Beet-root-sugar manufactories there, well worth seeing: and why the saccharine juice should not be crushed out of Beet-root as well as out of sugar cane, I cannot imagine; but I understand the Powers that be, in Prussia, like our own, have determined that the trade is to be 'crushed' instead, by the imposition of a heavily increased duty, very shortly, with the object of putting an end to it. But why should this be? If a trade grows up spontaneously, and healthily, in a country, on what possible principle of economy can it be desirable to destroy it, in order to purchase the same article, less cheaply, from a distance? Is this Free-trade or Protection? It seems to have the evil attributed to both without the good of either. "On account of the Revenue," is the only answer one can get. But what a way of making a Revenue; by destroying a domestic trade. For in this country there is not even the excuse of the 'Colonial' argument.

But Magdeburg is quite a garden of Forbidden Fruits: for another of its staple crops is Chicory, which is cultivated to a great extent, upon its beautiful soil. That wicked herb that has the witchcraft of making Coffee twice as good and twice as wholesome, and, by so doing, of ultimately increasing instead of diminishing its use, since, however good as a component, it is not good as a substitute, to any palate. I could not help thinking as I journeyed over the miserable eighty-five miles of sandy desert that separates Magdeburg from Berlin, that its splendid old Fortress may yet have another siege to stand of modern warfare in behalf of Free Cultivation and Common Sense.

Nothing can exceed the contrast between the Brunswick and the Berlin side of the Elbe. The country from a few miles out of Magdeburg, to Potzdam, is like the sea-shore, without a sea. Here and there a lake indeed: but all the rest a pale bleak drifting sand: and if one wondered before, where mouths could be found for all the produce, one wonders afterwards, for a much longer distance, where subsistence can be found for the half-million mouths of Berlin! which stands, like Tadmor of old, a city of palaces, in a desert. *C. W. H.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Professor Way, at the request of the Council, repeated his important lecture "on the Absorptive Powers of Soils in reference to Manures" at the house of the Society in Hanover-square, on Wednesday last; when a numerous and distinguished auditory were present on the occasion. We reserve, until next week, our report of this lecture, and the interesting discussion which ensued on its delivery.

Farm Memoranda.

Important Drainage Operations at Rufford.—This district, as our readers are aware, comprises immense tracts of low land, bordering on the river Ribble, and to a great extent incapable of cultivation, in consequence of their frequent inundation. To bring into operation an effective system of drainage on such land, has, during the last two years, been a favourite object with Sir Thomas Hesketh; but previous to more extensive experiments on Hesketh Marsh and other places, a portion of Martin Mere has been selected for the trial of a scheme of drainage suggested by Mr. Boosie, by which the land will be enabled to keep its "head above water" the year round, instead of being submerged to the depth of several feet, 5 or 6 months out of 12. "Martin Mere" is the name given to a very large tract of land (lying in the townships of Rufford, Tarleton, Burscough, Scarisbrick, and North Meols), which is constantly during the winter season, and also occasionally in the summer, covered with water. Its extent is about 5120 statute acres, to which there are four proprietors, viz., Sir Thomas Hesketh, the Earl of Derby, Charles Scarisbrick, Esq., and G. A. L. Keck, Esq. Up to the present time there is no recollection of this land having been under cultivation, in consequence of the continual inundations to which it has been subject. Upwards of 20 years ago the drainage of Martin Mere was contemplated by Mr. Miller, land surveyor, of this town, who drew up a report to the several landed proprietors, containing suggestions for effecting the object; but owing chiefly to the want of unanimity on the part of the proprietors, no practical improvement was attempted, and the land was permitted to lead its customary amphibious life, until Mr. Boosie, the present agent of Sir Thomas Hesketh, Bart., determined upon draining that portion of the Mere belonging to Sir Thomas, who was still unable to obtain the cordial concurrence of the other landed proprietors. The portion in question to which Mr. Boosie's efforts have been directed is at the eastern end of the Mere, within Rufford and Tarleton, and is about 1200 acres in extent, of which 800 acres will be reclaimed or benefited by the new drainage. The plan of drainage proposed by Mr. Boosie (in the execution of which he has had the able assistance of Mr. Porter) has been as follows:—In the first instance, two catch-water drains (about three and two miles in length respectively) have been formed to bring the surface-water from the higher grounds to a sluice which discharges itself into the river Ribble at Crossens. From the lower lands, however, in the interior of the Mere, the water could not be drained by this process (the level being quite as low as the outlet to the river;) therefore recourse has been had to mechanical means which we shall explain. Two principal and several collateral drains have been constructed to bring the water to one terminus or reservoir at the south side of the Mere, the water having in its course a fall to the reservoir of about 6 feet. At this terminus or reservoir an engine of 20 horse-power has been erected to lift up the water into the sluice already mentioned as the recipient of the catch-water drains, and which discharges itself into the river at Crossens. The process of lifting the water is as follows:—To the engine is attached an immense water-wheel, 30 feet diameter, with 40 scoops or buckets around the circumference. These buckets, when the wheel is revolving at its ordinary speed, lift up and discharge into the sluice 45 tons of water per minute, or upwards of 7½ million gallons of water in 12 hours! The water thus discharged into the sluice has a course of 4 miles to run into the cylinders at Crossens, through which it passes into the river. It is calculated that the total quantity of waste water lodged in the whole of the Mere annually, is no less than 25,000 millions of gallons, of which the portion of land belonging to Sir Thomas Hesketh will receive about 250 million gallons annually, and all this will have to be pumped away by the machinery we have described. To prevent the water, after being raised into the sluice, rising and again overflowing the land, an embankment 4½ feet in height, and upwards of three miles long, has been raised along the margin of the sluice. Of the 800 acres of land which will now be brought into cultivation by the drainage being effected, a large proportion has hitherto produced only a scanty herbage of the poorest Grasses. It will in future be fitted for all sorts of crops, some of it being very fertile soil, particularly adapted for growing Potatoes and other vegetables, for which Rufford and the vicinity have long been famous, and it is almost needless to say that the cultivation of so large a tract of hitherto lost and useless land will considerably increase the employment of the labouring classes in that neighbourhood. The salubrity of the district must also be improved by the removal of so large a body of stagnant water, exhalations from which are too often a subtle source of endemic disease. Were the other landed proprietors to imitate the spirited example of Sir Thomas Hesketh, 5000 acres of good land would be brought under profitable cultivation on Martin Mere alone, and if so desirable an improvement were extended also to the Formby district, the extent of land under cultivation in West Lancashire would be increased by no less than 11,520 acres! The improved value of the land, calculating it at the low rate of 10*s.* per acre, would be 5760*l.* per year.

In addition to the land actually under water during a great portion of the year, there are some hundreds of acres of adjoining land which will be indirectly benefited by these improvements, inasmuch as their drainage is at present very ineffective, in consequence of the long detention of the water in the lower grounds. Indeed, we may here mention the fact that the entire district to which Martin Mere and the Formby marshes have hitherto been the reservoirs, is upwards of 100 square miles in extent, a fact which shows to what degree the experiment now made by Sir Thomas Hesketh is capable of being extended by the adjacent proprietors, for their own advantage as well as that of the public. The engine, boiler, and water-wheel are comprised in a brick building, erected immediately to the east of the public road leading from Holmeswood to Ormskirk, and the tall chimney at the east gable forms a very conspicuous object for miles round in a landscape so level as that of the Martin Mere district. The whole of the machinery is from the establishment of Messrs. Benjamin Hick and Son, of Bolton. We have not been informed of the exact cost of the entire improvement, but we should think that it cannot have been less than 3000*l*. It may be here mentioned that one plot of the newly-reclaimed land (about 120 acres) has already been ploughed for a crop of Oats. Tuesday last was fixed upon for the first public working of the new draining apparatus. Accordingly in the forenoon of that day a considerable concourse of spectators, including the tenantry and labourers for miles round, and a number of visitors interested in agricultural improvements from Preston, Ormskirk, &c., assembled to witness the experiments. About 10 o'clock the engine with its immense water-wheel was set in motion, and continued during the day lifting the water out of the race in which it was brought from the Mere, into the sluice which conveyed it to the river. The process went on most satisfactorily, and the gradual subsidence of the water in the drain leading to the engine, soon showed how effectively it was performing its task. Since writing the above we learn that by Thursday the water in the catch ditches within the banks was reduced 4 feet below the surface of the land; and with the apparatus frequently at work, it is not expected to be any higher in future. *Preston Guardian.*

Farmers' Clubs.

EAST ILSLEY, *March* 27: *On the best method of managing Farm-yard Manure, so as to make it the most productive*:

Mr. FORDHAM, of Snelsmore-hill East, said, 20 or 24 bushels of Wheat per acre, at 35*s.*; 32 to 36 bushels of Barley, at 20*s.*; or 40 to 48 bushels of Oats, at 14*s.* or 15*s.*, must occasion an awful loss of capital, and surely some improvement in husbanding that "life's blood" of farming, or an improved method of making it, should be our constant attention—the system of our forefathers must be laid aside—the method of 40 years ago is of very little use now. I regret I cannot point out in this locality a farm-yard formed according to my idea among the many I am acquainted with. The prevailing fault is the waste of space. Many so large that much of the straw is as free from "mulch" as when it was first laid down, perfectly void of any manure, and blowing about as dry litter. A few pigs are seen in this great waste, and perhaps two or three cows or heifers; the stable-dung cast out in the rudest manner, and there suffered to lie, as chance may happen, wet or dry, until the time arrives between the breaking up of winter and the finishing of the spring crops; when this stuff, in the middle of the yard, well saturated with rain water, is carted, with a portion of the dry top and side straw mixed with it, and hauled to the field intended for Swede Turnip or Mangold Wurzel. No farm-yard can be complete without all the buildings are spouted to carry off rain water. One great deficiency in many farming concerns is the very inadequate mode of making manure. Unless a large quantity of this indispensable ingredient is made on a farm, it is utterly impossible that good farming can be attained. This manure can only be raised by feeding upon green crops with large stock. The economy of the management of the farm-yard depends upon collecting and preparing manure. When manure from the stables, cattle stalls, and other places are collected, and put under cover, pit, or hovel, it is certain that fermentation will take place, and every fresh addition of litter will ferment, as, in the first instance, the mass in the lower part will cool and keep cooling upwards as the decomposition goes on; considerable reduction in the original bulk will take place, the gas generated during the process of decomposition would pass upwards; the escape might be prevented by covering it with gypsum, which would convert the ammonical gas into sulphurate of ammonia. Liquid manure added to the fresh litter excites fermentation. The method I adopt is to convey the drainage of the pigsties through the dung-pit, and by a lower drainage into a tank; if you follow this plan you would never have a "fire-fanged," or mould-like appearance. The advantage of this system, will be found, in my humble opinion, of great importance; a much greater quantity of the best fertilising manure will be attained, rich in phosphates, the best possible dressing for Beans, Swedes, or Mangold Wurzel, and of course for the succeeding crops. If no pit or hovel covered to prevent rain water or the escape of the fertilising gases, I would strongly advise the free use of sulphate of lime (gypsum) sprinkled over the farm-yard; it would fix a portion, and would be a good addition to the manure. The practical farmer should always use gypsum in the stables and cattle sheds. 50 lbs. of gypsum will supply 30 lbs. of sulphuric acid to fix the ammonia in a ton of farm-yard manure, if the decomposition is complete.—Mr. JAMES OWEN, of West Ilsley, said he had at all times great difficulty in managing his yard manure, the space being too large for the proper fermentation to take place, and thus little or no decomposition took place in the mass, the swine in the yard principally turning the litter about, near the stables. He had this day employed his man to throw up the litter in heaps, taking care to add the stable dung and that from the pigsties in due proportion with the different heaps. He regretted he had not a covered pit, as he had observed how much better the dung came from them to what it turned out in the general old-fashioned way. He instanced a large farm, where the yard was half an acre and upwards; he saw it once occupied by a single hog; he avoided coming through the mountain of straw, and had a path all round the yard, as if it was made for his especial exercise.—Mr. JOHN BROWN, of Compton, said he thought, as practical men, they were bound to give what information they could to one another, though he did not admire some of the public writings of the day; he thought much that appeared in print could not be carried out in practice upon a large scale, and he instanced the present society, some of whom had many hundreds of acres under their care, so that no day was too long for them; he had made some alterations in his pig management, so as to have the manure separate, having a drain and a tank in the outward sty, covered with open 1½ inch planks, to admit the liquid and the droppings from the pigs, adding, from time to time, ashes to absorb all moisture, intending to apply this mass to the land by drill. He admitted the improvement of the manure by keeping it under cover, but was confident upon a large scale it could not be done; besides the great space of fold-yards, he had a yard and hovel upwards of two miles from the homestead. He experienced great difficulty in making manure there; used to keep pigs there, but unfortunately always lost one or two in a season by the dishonesty of some one. As to these modern ways, he thought they were attended with great expense; hinted that our forefathers got crops, and so he thought it might be done again, though perhaps not quite so heavy as some farmers boasted. He related an anecdote of a friend, a large farmer, setting his man to cart into the dung-yard a quantity of snow to moisten the litter.—The Chairman, Mr. JONES W. WILLIAMS, thought that manure might be made much better in a pit or hovel covered, but these low-price times deterred many from improving their homesteads; he had a barn and yard two miles from home; being high, his straw and fodder was constantly blown from the yard, and dispersed to the neighbouring lands. He always experienced great difficulty to manure this land.—Mr. FORDHAM, in answering the objections to the modern farm-yards, said he recollected in this locality a farm, some years ago, under a six-course system and a naked fallow; even then about 24 bushels was near the average of this farm; was glad large holders of land, such as Mr. Jas. Owen and Mr. John Brown, admitted that a great difficulty did exist in making sufficient manure for such numbers of acres under one holding by the old-fashioned way, and though not admirers of some of our published recommendations, still they were moving in the right direction. The next monthly discussion is "How to live at the present prices." *Amicus.*

Miscellaneous.

The Con-acre System.—The con-acre system was hitherto the universal plan of conducting the labour of farms in this part of the country. According to the quality of the land, it was charged to the labourer at from 6*l.* to 8*l.* and 10*l.* an acre per annum, the most worthless heath being let, when limed, at the former sum. The rent was paid by the labourer's work; and the system was, to let out as much land as paid the whole labour bill of the farm. In every way the necessities of the labourer were taken advantage of. The highest rent was charged, and that was paid by the lowest rate of wages. This system of course fell to pieces when the Potato failed; and the farmer, having no capital to pay his labourers in cash, failed also. * * * Nothing has contributed so much to the entire dependence on the Potato, and the consequent increase of a miserable, half-fed, naked population, as the system of con-acre labour. No truck system is comparable with this. It encourages a tenant without means to offer an exorbitant rent for land, which he pays by exacting one still more oppressive from his labourer. Its two-fold action is to raise rents, and depress wages, by over-competition. Enormous rents are exacted for the patches of Potato ground, which are paid by the very lowest scale of nominal wages. It compels an entire reliance on the Potato, inasmuch as the labourer can get Potatoes only for his food, no money-wages being ever paid. It encourages the landlord to expect a high rent for his land, without demanding from him in return any outlay for its permanent improvement. *The Plantation Scheme, by Mr. Caird.*

Tiptree Farm.—As very exaggerated and incorrect statements have been put forth respecting my farming operations, I have, on public grounds, and by the advice of competent friends, determined that six public valuers of eminence shall, in due season, value my present standing crops, stock, and implements, and fix the rent I have to pay, placing me in the position of a new tenant, entering upon the farm at Michaelmas next. My accounts will be annually submitted to the same valuers, and the detailed results or balance-sheet, good or bad, published in your journal, under their audit, sanction, and responsibility, my account-books and servants being, of course, at all times accessible to them. I pledge myself thus publicly to this course so long as I may continue to farm, in order to stimulate agricultural amendment and to test the practicability of farming poor lands profitably under our altered circumstances, with the necessary appliances of skill and capital on the part of both owner and occupier. *J. J. Mechi, in the Times.*

Calendar of Operations.

MAY.

SOUTH HAMPSHIRE FARM, *May* 11.—Since our last report the weather has been for the most part cold, for the time of year, and ungenial for vegetation. The sharp frosts which we have experienced lately have been beneficial than otherwise to the Wheat plant, upon all good soils in high cultivation, as the check which it has received will go far to prevent any superabundance of straw; but upon light and thin land, and also upon strong undrained soils, the appearance is altered so much for the worse that we much doubt whether an average crop of straw or corn will be obtained from such soils. The horse labour has been much retarded lately by a succession of wet weather; yet we have finished drilling and dibbling our Mangold Wurzel and Carrots. The horses have been engaged during the intervals of dry weather in ploughing, harrowing, rolling, &c.; forwarding the tillage of land intended for the Turnip crop—but the fallows generally are not in a forward state, so much time having been lost by the succession of rains during the month of April. Our labourers have been employed by draining in the meadow land and in the ordinary work of the farm, such as continually presents itself with the season; also by cutting and burning the sod upon the borders of the fields for the purpose of obtaining a supply of ashes, at all times useful for mixing with artificial manures for application to the Turnip crop. Some of our men have been employed during wet weather in screening ashes, and mixing with night-soil, in readiness for drilling with superphosphate and bone-dust for the Turnip crop, which application we found last year answer best of any we used. Our crop of Swedes for several years past having had a great tendency to rottenness and decay, we were induced to try some experiments upon the comparative value of the application of 2½ cwt. of superphosphate of lime, with 20 bushels of ashes, drilled, and 2 cwt. of Peruvian guano, sown broadcast, per acre, and of an application of 2½ cwt. of superphosphate of lime and 20 bushels of ashes with bone-dust previously mixed and fermented in yellow sand. The money value of each application was the same: the result was from three to four tons per acre more Swedes were produced where guano was applied, but there was in every instance a great loss from rottenness and deficiency in nutriment upon the soils where tried, viz., loam, clay, sand, and gravel; whereas the Swedes grown from the application of fermented bone-dust, in addition to the superphosphate, although the lesser crop, were the most valuable, having proved sound and highly nutritious in every instance up to a late period of the feeding season. We have no hesitation in saying that we can distinctly trace the rottenness of former seasons to the effects of guano, which we have used for the growth of our Turnip crops. We have in consequence decided upon discontinuing the application of guano for the Turnip crop, believing as we do that guano and all manures possessing a large proportion of ammonia are best suited to the growth of corn and Grass, and that when applied to Turnips it will be found too stimulating, and producing in every instance roots deficient in nutrition and hardihood. *J. B.*

Notices to Correspondents.

ADDRESS: *Mr. Crockford*, who describes his steam engine in No. 18, would much oblige us by his address.

AMERICAN CHURN: *Scotus.* It was thought that the account of it at page 269 would suffice. It is a small box churn, half filled with the milk or cream, the dasher contains cells which lift the milk as they rise, letting it escape and fall again through the air, and carry air down with them, which also escapes and rises again through the milk, so that it is an admirable contrivance for thoroughly mixing the air and the milk, at the same time that the latter is as completely shaken and shattered as by any ordinary churn. Further particulars can be given only by advertisement.

BACON: *Sigma.* Fifty of salt to one of saltpetre; but we do not know how much is rubbed into a flitch. It is used abundantly, and suffered to lie upon the flitch in excess. Mangold Wurzel and Turnip seed will not suffer from a little caustic lime being dusted among them.

BONES: *E T F.* The best way of dissolving them most certainly is by the use of acid. There is no loss during the process, if conducted with ordinary care.

EARLY TURNIP: *J E M.* The Swede is hardier than the Turnip, and may be sown the earliest, but you cannot sow in the end of March without great risk of losing the young plant by frost.

EDUCATION: *W P, Taunton.* Many thanks: we have access to the works you name.

FLAX: *J K.* Sow 10 pecks per acre. Buy T. K. Short's Tract on the subject.

GUINEA FOWL: *Sylvanus* wishes to know if the guinea fowl ever breeds with the the barn-door fowl, as a friend of his thinks that he has some hybrid chickens[!]

HAMPSHIRE FARM: *The Reporter for South Hampshire Farm*, in answer to the enquiries of "A. B." begs to say that a good bred horned ewe will make her lamb 10 lbs. per quarter in about 11 weeks, if well kept; and the food required to fatten the ewe at the same time will be 1 pint of Oats and ½ lb. Linseed-cake per day, in addition to cut Swedes and hay.

RURAL CHEMISTRY, by E. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

Markets.

COVENT GARDEN, MAY 18.

Vegetables are well supplied, but most kinds of winter Fruit are over. Strawberries and Hothouse Grapes are both more plentiful, and the same may be said of Pine-apples, of which some good fruit may be obtained. Walnuts and Chestnuts are abundant; and Oranges and Lemons sufficient for the demand. A few bunches of young Carrots and Turnips may be had at from 6d. to 2s. 6d. per bunch; and some green Peas of good quality have been supplied from Cornwall and France. Frame Potatoes fetch from 1s. to 2s. per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, Pinks, Carnations, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Oranges, per doz., 9d to 1s 6d
Grapes, hothouse, p. lb., 5s to 10s	— per 100, 5s to 12s
— Portugal, p. lb., 9d to 1s	Almonds, per peck, 6s
Strawberries, per oz., 4d to 1s	— sweet, per lb., 2s to 3s
Gooseberries, green, per half sieve, 5s to 7s	Walnuts, p. 100, 1s 6d to 2s
Apricots, green, p. pottle, 8d to 1s	— p. bush., 16s to 24s
Apples, kitchen, p. bsh., 4s to 6s	Nuts, Barcelona, per bush., 20s to 22s

Celery, p. bundle, 8d to 1s 6d	Horse Radish, p. bdl., 1s to 4s
Carrots, per bun., 5d to 7d	
Spinach p. sieve, 9d	

POTATOES.—SOUTHWARK, May 13.

The Committee report that the market has been but moderately supplied this week, both coastwise and Continental; there are so many in store, that it is only good fresh Potatoes that make a little more money. The following are this day's quotations:—York Regents, 110s. to 130s. per ton; Scotch cups, 60s. to 70s.; ditto whites, 40s.; French whites, 40s. to 65s.; Rhenish do., 40s. to 65s.; Belgian do., 40s. to 60s.; Dutch, 35s. to 40s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, May 16.

Prime Meadow Hay	68s	to 74s	Clover	60s	to 85s
Inferior ditto	55	65	New Clover	—	—
Rowen	54	60	Straw	22	25
New Hay	—	—		J. COOPER.	

The supply short, and prices looking up.

CUMBERLAND MARKET, May 16.

Prime Meadow Hay	75s	to 80s	Inferior	60s	to 68s
Inferior ditto	50	68	New Clover	—	—
New Hay	—	—	Straw	26	28
Old Clover	75	88		JOSHUA BAKER.	

WHITECHAPEL, May 16.

Old Clover	75	80			

COAL MARKET.—FRIDAY, May 17.

Wallsend Braddyll's Hetton, 15s. 6d.; Wallsend Haswell, 16s. 9d.; Wallsend Lambton, 15s. 9d.; Wallsend Tees, 16s. 3d. Ships at market, 111.

SMITHFIELD, Monday, May 13.

The number of Beasts is rather larger than on Monday last; trade is, however, quite as good; indeed 3s. 6d. is more generally given for choice Scots. The supply of Sheep is by no means large; trade is active, and on the average prices are better. Lamb meets with a cheerful sale at a small advance. The Calf trade is very dull, especially for middling qualities. From Holland and Germany there are 203 Beasts, 340 Sheep, and 75 Calves; from Scotland, 500 Beasts; and 2400 from Norfolk and Suffolk.

Per st. of 8 lbs.—s	d	s	d	Per st. of 8 lbs.—s	d	s	d
Best Scots, Herefords, &c. ... 3	4	to 3	6	Best Long-wools . 3	8	to 4	0
Best Short-horns 3	2	— 3	4	Ditto Shorn ... 3	4	— 3	8
2d quality Beasts 2	8	— 3	0	Ewes & 2d quality 3	4	— 3	8
Best Downs and Half-breds ... 4	0	— 4	4	Ditto Shorn ... 3	0	— 3	4
Ditto Shorn ... 3	6	— 3	10	Lambs 5	0	— 5	8
				Calves 2	10	— 4	0
				Pigs 3	0	— 4	0

Beasts, 3579; Sheep and Lambs, 23,070; Calves, 177; Pigs, 250.

Friday, May 17.

The supply of Beasts is large, and, the weather being warmer, the demand smaller; consequently trade is heavy, and they cannot all be sold, although a reduction is submitted to. The number of Sheep and Lambs is unusually large; prices for the former are about the same as on Monday, and for the latter fully 4d. per 8 lbs. lower, with a great many left unsold. Calves are plentiful, but the average quality not good; consequently choice ones are making 4s. freely. From Germany and Holland there are 207 Beasts, 300 Sheep, and 145 Calves; from Scotland, 600 Beasts; from Norfolk, 100; and 133 Milch Cows from the home counties.

HOPS.—Friday, May 17.

Messrs. Pattenden and Smith report that the demand continues good for all healthy and well kept Hops. The bine is still in a very backward state, and looks unkindly.

MARK LANE.

Monday, May 13.—The supply of English Wheat to this morning's market being small, factors were enabled to realise it at 1s. per qr. over the rates of this day se'nnight. Foreign was in less active demand than last week, but being held with great firmness, a similar improvement was insisted upon in the retail sales which were effected.—Barley and Oats maintain the advance of Friday last, viz., 6d. to 1s. per qr.—Beans and Peas are also 1s. per qr. higher.

Friday, May 17.—The arrivals of grain from abroad during the week have been to a fair extent, with the exception of Oats, which are small, as are also the supplies from our own coast. This morning's market was poorly attended, and the business transacted very limited; we quote Wheat, both English and foreign, nominally the same as on Monday.—Barley, Beans, and Peas are held for that day's prices.—Oats are the turn dearer; 30s. is made for Galatz Corn arrived, and 37s. refused for Polish Odessa floating.—Flour is a dull sale at late rates.—The weather to-day is warmer and more genial.—Since the 10th inst. the weather has been showery with a very cold atmosphere, and occasional night frosts. Vegetation has made but little progress.

Liverpool, Friday, May 17.—Influenced by a return of mild weather, and a slender attendance of country millers, less animation was displayed in the Wheat trade at our market this morning than on the previous days of the week; the operations in Wheat being only moderate, and holders nevertheless remaining equally firm as before. Barley and Malt, upon a moderate demand, remained unaltered in value. We have no change to note in English and foreign Beans, excepting Egyptian, which are held steadily at 6d. per qr. advance. Oats, though not readily saleable, slightly improved in value.

HARTLEY'S PATENT ROUGH PLATE GLASS.

In submitting our list of prices, we would beg to direct attention to the Leading Article of the *Gardeners' Chronicle* of Saturday, Dec. 8, upon the subject of "Patent Rough Plate." Some alteration having been made in the mode of manufacturing this description of Glass, the quality is greatly improved, and we now supply it perfectly flat, and, by an arrangement with Messrs. Hartley and Co., precisely at their prices. Cut to order in panes of

8 by 6	and under 10 by 8	at 4½d.	per foot.
10 by 8	,, 14 by 10	at 5d.	,,
14 by 10	,, 1½ foot	at 5½d.	,,

7 by 5 and 7½ by 5½...12s. 0d. 9 by 7 and 10 by 8 ...15s. 0d.

Milk Pans from 2s. to 6s. each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Wasp Traps, 3s. 6d. per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7s. 6d; 6 tubes, 10s. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

JAMES PHILLIPS and CO., 116, BISHOPSGATE STREET WITHOUT, LONDON.

GLASS FOR CONSERVATORIES, &c.

Hetley and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. Millington's SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

Of every manufacture FIT FOR USE, including the make of Messrs. Chance, Hartley, Swinburne, and others.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. Cogan and Co., 48, Leicester-square, London.

MEADOW AND PASTURE GRASS SEEDS.

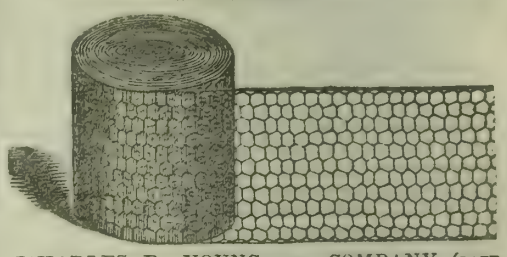
George Gibbs and Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32s. per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1s. 3d. per lb.; fine sorts for forming Lawns, 1s. 4d. per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

TO FLORISTS, HORTICULTURISTS, &c.

Morrell's REGISTERED FLOWER LABELS are ready for delivery in any quantity; they will be found unimpaired by any change of weather, either of heat, cold, wet, or dry, and therefore suitable for the Stove, Hothouse, Greenhouse, or the open ground; also his improved Flower Sticks, of various lengths, from 12 inches upwards.—May be had of most Seedsmen and Ironmongers in town and country; and wholesale at 149, Fleet-street, London.

Baker's PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

BEE HIVES.



George Neighbour and Son respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: Wm. Drury, Castle-street, Liverpool; Hall and Wilson, 50, King-street, Manchester; Austin and M'Aslin, 168, Trongate, Glasgow.

Netting, Flags, and Bunting.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from John King Farlow's Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 2d. per yard 2 yards wide, or 6d. per yard 4 yards wide. Woollen Bunting, any length or width, at 6d. per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

Allsopp's BURTON and EAST INDIA PALE ALES.—Messrs. S. Allsopp and Sons beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

Charles D. Young and Company (late W. and C. Young),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

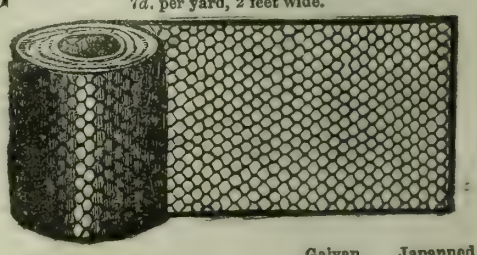
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...		7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...		9 ,,	6½ ,,
2-inch ,, extra strong ,, ...		12 ,,	9 ,,
1½-inch ,, light ,, ...		8 ,,	6 ,,
1½-inch ,, strong ,, ...		10 ,,	8 ,,
1½-inch ,, extra strong ,, ...		14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

Sales by Auction.

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith, in consequence of the premises being required by the London and Birmingham West-India Dock Junction Railway Company, to sell by Auction, on the premises, Dalston, Middlesex, on MONDAY, May 27, and following day, at 12 o'clock each day, the valuable GREENHOUSE PLANTS, consisting of choice Azalea indica, Erica, Epacris, Boronia, Burchellias, Diosma, Pimelea, Erythrina, Kennedya, Metrosideros, Fabiana, Geraniums, Fuchsias, Verbenas, Chrysanthemums, Lobelias, Calceolarias, Heliotropes, Cupheas, Myrtles, Hydrangea, Alstrœmerias, Cactus, Gardenias, Clianthus, Dahlias, Clematis, Jasmine, Aloes, Brooms, Roses, Magnolia grandiflora, &c.—May be viewed two days prior to the sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises, at the Shop in Covent-garden, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

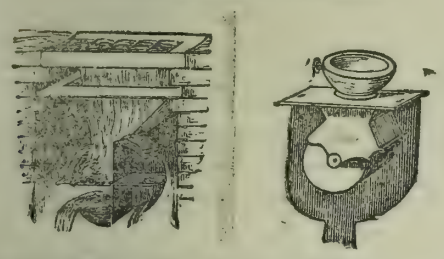
TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, May 23, and FRIDAY, May 24, at 12 o'clock, about 1000 DAHLIAS, consisting of all the leading sorts and the newest varieties; together with Fuchsias, Verbenas, Heartsease, Geraniums, and a variety of Ornamental Plants for Bedding.—On view on the morning of Sale. Catalogues to be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TULIPS. — To be sold cheap, the ground being wanted for building on, a Bed of Choice TULIPS, 65 rows, 455 roots, price 10*l.*; a Bed of Offsets, 60 rows, 5*l.*; and a Bed of Seedlings and Breeders, 62 rows, 7*l.*; either together or separately in rows: and also Border Boards, iron Hoops, Canvas, Drawers, &c. The Tulips consist of a fine strain of Louis XVI., Victoria, Lavinia, Ada, Rainbow, Titian, Claude, Magnet, Solon, Rose Brilliant, Queen Boadicea, &c. Also a Garden Seat, 10 feet long and 6 feet high, with the back in the Chinese style, price 5*l.*—May be seen on application to Mr. T. CONSTABLE, Oil and Colourman, 36, Lower-street, opposite Church-street, Islington, London.

CORNWALL.

TO BE LET, for 14 or 21 years, from Michaelmas next, Three or Four FARMS, situated in the most fertile district of that county, containing about 200 acres each (to which more may be added) of Arable and Pasture Land, with thriving Orchards. Every information respecting these Farms, which are in a fair state of cultivation, may be obtained by addressing a letter to A. B., Post-office, Bodmin, Cornwall.



N.B. It may be right to add that none but men of skill and capital will be treated with, to whom long terms (at corn rents, if preferred) will be granted.—May 18.

TO GENTLEMEN FARMERS. — If this should meet the eye of any married gentleman largely engaged in farming pursuits, having more house accommodation than he requires, and residing in a part of the country that can boast of a good trout river, for fly-fishing, and fair general shooting, and who for society sake might wish to meet with, and to accommodate, a married gentleman, who is an officer in the army, without family, but with one servant, he may do so, by fully entering into particulars upon each point, with L. M. N. R., 10, Charles-street, St. James's-square, London.—Any offer that may appear eligible will be replied to.

STOUT AND PORTER.— JENNER, WICKING, AND JENNER are now delivering, for cash, to private families, their celebrated PORTER, at 1*s.*; and IMPERIAL STOUT, at 1*s.* 4*d.* per Gallon.—May be had in casks of 4½, 9, 18, and 36 gallons.

N.B. Their Ales are now in very fine condition.
South London Brewery, Southwark-bridge-road.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, King's Road, Chelsea, near the Bridge.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION. — Beware of the words "From METCALFE'S," adopted by some houses.

TABLES ON DRAINING.
Just published, price 2*s.* 6*d.* cloth,

AN ANALYSIS OF THE BRITISH FERNS, and their Allies. By G. W. FRANCIS, F.L.S. Author of "The Little English Flora," "Grammar of Botany," &c.

London: SIMPKIN, MARSHALL, and Co.

CURTIS'S BOTANICAL MAGAZINE.—This, the oldest, and confessedly the best of our botanical periodicals, is now in the 64th year of its existence, without the intermission of a single month. While many rival publications have been discontinued, this still retains its pristine vigour numbering upwards of 4500 beautiful and accurately coloured Plates. During this lengthened career there have been many fluctuations in the sale of this valuable periodical, and this, with other easily imagined causes, must have left in the hands of the public a great number of incomplete copies of the work, which not unfrequently fall into the hands of parties desirous of rendering them perfect. Under these circumstances the proprietor has thought it desirable to make known to the public generally, that any imperfect copies can be completed, on application by post, or otherwise, to Mr. SAMUEL CURTIS, High-street, Homerton, who will deliver the required Numbers to any part of London.

Also GENERAL INDEX to the first 53 Volumes, with Memoir of the Author.

COMPANION TO THE BOTANICAL MAGAZINE. — This work was published a few years ago, and contains a series of original articles, recording such useful botanical information as was not suited to the pages of the magazine, and is illustrated by 48 Plates and Portraits of eminent collectors of plants. It will be read with pleasure even by those who are not deeply versed in science. It contains, among other papers of great interest, a Journal of an ascent to Adam's Peak, Ceylon; an Account of Mr. Matthews' Journey to the Peruvian Andes; Memoirs and Portraits of the late Messrs. Fraser, Douglas, and Cunningham, &c.

Price, in 2 Vols., 8vo, cloth boards, 25*s.*

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21*s.*, 18 gallons; 10*s.* 6*d.*, 9 gallons; Family Ale, 16*s.*, 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

BEAUTIFUL TEETH.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE. A white Powder, compounded of the choicest and most *recherché* Ingredients of the Oriental Herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in giving sweetness and perfume to the Breath. It extirpates all tartarous adhesions to the Teeth, and ensures a pearl-like whiteness to the enamelled surface. Its Anti-Septic and Anti-Scorbutic properties exercise a highly beneficial and salutary influence; they arrest the further progress of decay of the Teeth, induce a healthy action of the Gums, and cause them to assume the brightness and colour indicative of perfect soundness; while, by confirming their adhesion to the Teeth, they give unlimited enjoyment and fresh zest to appetite, by perpetuating effective and complete mastication. The Proprietors of this Dentifrice pledge themselves that its efficacy in preserving and embellishing the Teeth far surpasses anything of the kind ever yet offered to the public, and has, in consequence, obtained its selection by Her Majesty the Queen, the Court and Royal Family of Great Britain, and the Sovereigns and Nobility of Europe. — Price 2*s.* 9*d.* per box.

CAUTION.—To protect the public from fraud, the Hon. Commissioners have directed the Proprietors' Name and Address, thus—"A. ROWLAND and SON, 20, HATTON GARDEN," to be engraved on the Government Stamp, which is affixed on each box. Sold by the Proprietors and by Chemists and Perfumers.

THE ONLY RATIONAL REMEDY IS

PARR'S LIFE PILLS.

THE ADVANTAGES DERIVED FROM TAKING PARR'S LIFE PILLS ARE,

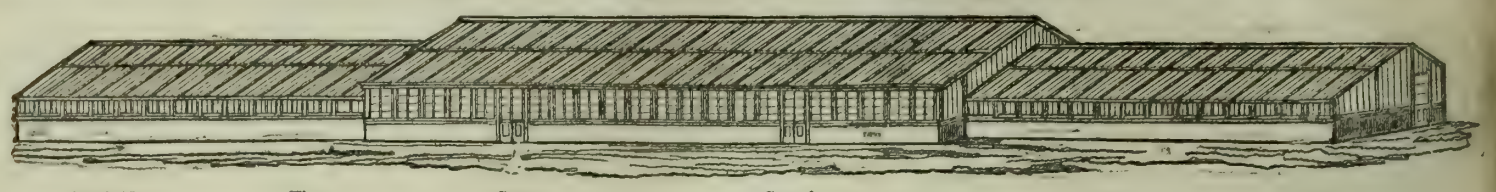
1ST.—LONG LIFE AND HAPPINESS.
2D. —SOUND AND REFRESHING SLEEP.
3D. —GOOD APPETITE.
4TH.—ENERGY OF MIND, AND CLEARNESS OF PERCEPTION.
5TH.—GENERAL GOOD HEALTH AND COMFORT.
6TH.—THEY ARE FOUND, AFTER GIVING THEM A FAIR TRIAL FOR A FEW WEEKS, TO POSSESS THE MOST ASTONISHING AND INVIGORATING PROPERTIES.

To have produced a medicine so benign and mild in its operations and effects, and yet so effectual in searching out and curing disease of however long standing, exhibits on the part of OLD PARR deep research and a thorough knowledge of his subject. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Direction.

Sold in boxes, at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

Wholesale London Agents:—Messrs. Barclay and Sons, Farringdon-street; Edwards, St. Paul's Church-yard; Sutton and Co., Bow Church-yard; Sangar, 151, Oxford-street; Hannay and Co., Oxford-street, London; Mottershead and Roberts, Manchester; Raimes and Co., Edinburgh; and J. Noble, Boston; and sold by all chemists.

A CLEAR COMPLEXION.



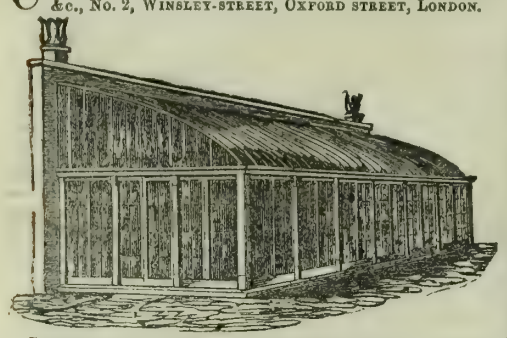
GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY. —This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

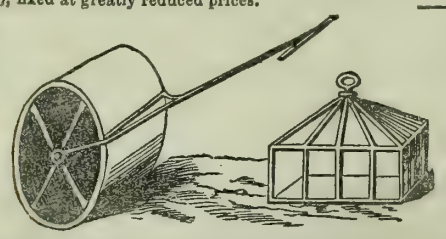
Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

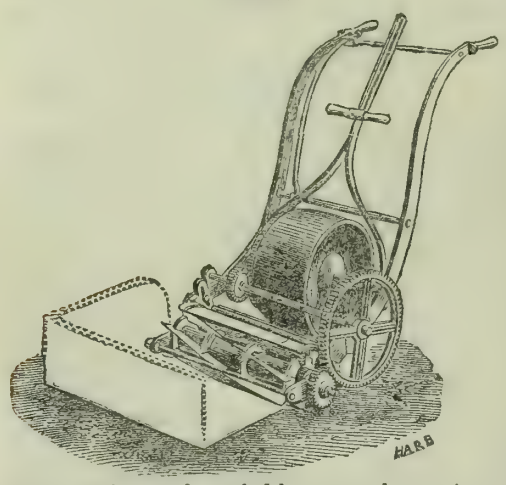
COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.



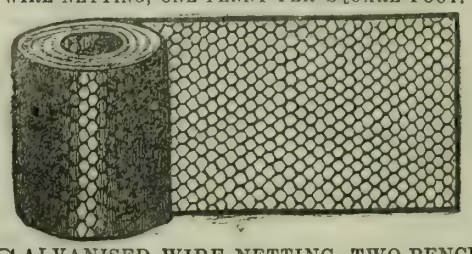
Every description of Work, both plain and Ornamental, in wrought and cast iron, for Gardens, &c. &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

BUDDING'S PATENT MOWING MACHINE.



This Machine may be worked by persons who cannot use a Scythe. It may be adjusted to cut any length, and leaves a more even surface than can be produced by the most skilful mower. The Grass may be cut when dry, and may be collected in the box, which enables the gardener to cut his lawns at the most convenient time, and renders sweeping afterwards unnecessary, while with the same amount of labour more than double the quantity of work can be done than with a scythe. Various sizes are made both for manual and horse power, and the prices have this year been reduced to the lowest possible scale. There are now between 3000 and 4000 of these Machines in use.

Manufactured and sold by JOHN FERRABEE and SONS, Phœnix Iron Works, near Stroud, Gloucestershire.

GENERAL WHOLESALE AGENTS.—Messrs. Ransomes and May, Ipswich.

AGENTS.—Messrs. Mapplebeck & Lowe, Bull Ring, Birmingham; Messrs. Lister and Lees, Cateaton-street, Manchester; Mr. Wm. Drury, Castle-street, Liverpool; Messrs. J. Nelson and Sons, 47, Briggate, Leeds; Mr. T. Johnson, Leicester; Messrs. Stratton, Hughes, and Co., Clarke-street, Bristol.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard	30 inches wide	7½d. per yard.
18 "	4½d. "	36 "	9d. "
14 "	6d. "	48 "	1s. "

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

HENRY BIERTUMPFEL, MANUFACTURER OF IMPROVED AND PATENT GARDEN SYRINGES, AND ORNAMENTAL ICE MOULDS, 68, Albany-street, Regent's-park, London, respectfully tenders his thanks to Gentlemen, Florists, Nurserymen, &c., for their continued and extending patronage, and ventures to hope that he may still be honoured with their commands. To those who have not at present used his Improved and Patent Garden Syringe, he respectfully solicits a trial, as he can confidently recommend them to be unsurpassed either for durability, cheapness, or utility; and being manufactured of the Imperial White Metal, they never corrode or cause verdigrease, to which the brass ones are liable.

H. B. would also take this opportunity of calling attention to his New and Ornamental Ice Moulds, they being a very great improvement upon the old shape. They are used and approved of by some of the first Club Houses in London, and by all the most eminent Confectioners, and are particularly admired for their elegant and unique shape.

N.B. Made in Pints, 1½ Pints, Quarts, and 3 Pints.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

NEW TRAVELS IN NORTHERN AFRICA.

Now ready, in 2 vols., 21s. bound,

DIARY OF A LADY'S TRAVELS IN NORTHERN AFRICA.

"These exceedingly interesting volumes contain a very lively and graphic narrative of the author's experiences amongst the curiously mixed population of Barbary; with many important facts and much useful intelligence."—Weekly Chronicle.

London: HENRY COLBURN, Publisher, 13, Great Marlborough-street, London.

GARDENERS' BENEVOLENT INSTITUTION.—NOTICE is hereby given, that a GENERAL MEETING of the Subscribers will take place at the London Coffee-house, Ludgate-hill, on WEDNESDAY, the 12th of June next, for the purpose of considering a Report from the Committee, recommending certain Alterations in the Rules of the Charity. An Election of TWO PENSIONERS will also take place from among the following Candidates, whose testimonials have been examined and approved by the Committee:

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

The next Meeting will take place on SATURDAY, the 8th June. The Gates will be open to visitors at One, P.M. Tickets are issued to the orders of Fellows at this Office, price 5*s.* each, or at the Garden in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each.

N.B. No Tickets will be issued in Regent-street on the day of Exhibition. 21, Regent-street.

J. COLE, NURSERYMAN and FLORIST, Rugby, Warwickshire, begs to inform the public that his SPRING CATALOGUE OF BEDDING PLANTS is now ready, at the following reduced prices:

DAHLIAS, fine named sorts, 6*s.*, 9*s.*, to 12*s.* per dozen.
VERBENAS, of last year, 6*s.* per dozen.
Do., good mixed varieties, 3*s.* 6*d.* per dozen.
HELIOTROPES, 4*s.* per dozen.
PETUNIAS, good mixed, 3*s.* 6*d.* per dozen.
GERANIUMS, good named, 8*s.* to 12*s.* per dozen.
PHLOXES, 6*s.* to 9*s.* per dozen.
ANTIRRHINUMS, 6*s.* per dozen.
Catalogues may be had by inclosing one penny stamp.

VERBENA—"MELINDRES ALBA."

G. H. BUNNEY, NURSERYMAN, Stratford, Essex, is sending out strong plants of the above VERBENA, price 2*s.* 6*d.* each, or 24*s.* a dozen. The usual allowance to the Trade.

The above Verbena is of dwarf compact habit, and a very profuse bloomer, making it one of the very best white Verbenas for small beds, or single plants in the flower border.

CHEAPEST BEDDING PLANTS OFFERED THIS SEASON.

VERBENAS, CALCEOLARIAS, PETUNIAS, Mimulus, Fuchsias, Heliotropes, Salvias, Mesembryanthemums, Dahlias, &c. Strong well-established plants, 3*s.* per doz.—THOMAS WATTS, Camden Nursery, Camberwell, London.

SPLENDID SPECIMEN AZALEAS.

WM. IVERY, Hanover Nursery, Peckham, has some Splendid Specimen AZALEAS for Sale, of the following celebrated varieties, which may be seen in full bloom at the above Nursery, or price given on application:—Lateritia Formosa or Conqueror (Ivery's), Iveryana (ditto), Rosea Elegans (ditto), Coccinea Superba (ditto), Delicata (ditto), Lateritia Pulchra.

GREENUS'S DWARF BONNET ASTER "MULTIFLORA."—Best Bedding Flower of last season, producing the greatest quantity of blossoms of the largest size in the smallest space of any flower yet introduced.

"Average height, 6 to 9 inches; diameter of plant, 15 inches; diameter of flower, from 2 to 2½ inches; average number of flowers on a plant, 30 to 40; perfectly double; colour, light purplish-crimson or high rose. As a bedding ornament it is unrivalled." See Gardeners' and Farmers' Journal, in Editor's remarks of 22d September last, at page 600.

EDWARD RUTTER GREENUS begs to say that he will be happy to supply healthy plants of the above at 2*s.* per dozen, and if five dozen or more are taken, carriage paid to any part of the kingdom. Poor soil most suitable to plant them in.

Post-office orders expected from unknown correspondents.

Railway Nursery, Watford, and Nurseries, Rickmansworth.

ESCALLONIA MACRANTHA.

LARGE RED-FLOWERING EVERGREEN ESCALLONIA.

MESSRS. VEITCH AND SON have much pleasure in calling the attention of the public to the above beautiful Escallonia (figured in Curtis's Botanical Magazine for October 1849, and therein described as "assuredly the handsomest of all the known species.") It has proved a perfectly hardy evergreen Shrub, having stood in the open border during the last severe winter, free from injury, without any protection whatever. The foliage is a dark glossy green, habit compact and good, and an abundant bloomer through the summer and autumn; it is altogether a very fine plant, and one they can confidently recommend. Fine well-established plants on and after the 1st of June at 21*s.* each; one plant over to the trade on every three taken.

A coloured Plate and letter-press description may be had (postage free) on application enclosing six postage stamps.

Also ready, on and after the 1st of June, the following new and desirable plants, viz.,

OXALIS ELEGANS, Elegant Wood-Sorrel from Peru.

This beautiful Oxalis, which is figured and fully described in Paxton's Magazine of Gardening for October 1849, also in Curtis's Botanical Magazine for January last, was exhibited and received a medal at the London Horticultural Society's meeting in Regent-street, July 1848. It has stood three winters uninjured, without shelter, in the open border, and may therefore be considered a hardy plant. It is an abundant bloomer, flowering from June till November, and a very desirable and showy plant for the flower-garden. Good established plants 5*s.* each, or six plants to the trade for 21*s.*

CALCEOLARIA GRANDIS.—A dwarf, compact, evergreen, shrubby, Peruvian species, with green glossy foliage, and an abundant bloomer; exhibited at Chiswick, May 1849, when the large silver medal was awarded it. Good established plants 5*s.* each, or six plants to the trade for 21*s.*—Exeter, May 25.

CEDRUS DEODARA.—Seeds of this magnificent hardy tree, recently imported from India, and warranted fresh, may be had till the end of June, when the remainder will be planted. Price 2*s.* 6*d.* per 100, or 20*s.* per 1000 seeds.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

Streatham-place Nursery, Brixton-hill, near London.

SEEDLING PELARGONIUM EXHIBITION.—The Seedling Pelargonium Exhibition is to be held this year at the Surrey Zoological Gardens, on WEDNESDAY, JUNE the 19th. The following Prizes are offered for Seedlings not less than two years old, and which have not yet been let out to the public: 1st, 5*l.*; 2d, 4*l.*; 3d, 3*l.*; 4th, 2*l.*; 5th, 1*l.*; 6th, 10*s.* To be paid immediately after the award.

Exhibitors will please to remember that the judges will be directed to withhold any of the prizes if the plants exhibited are considered no improvement upon the varieties already in cultivation. On the other hand, 2*l.* more than are offered will be at their disposal in case any deserving seedlings remain unrewarded after the distribution of the above prizes. The judges will be requested to bear in mind the object the Subscribers have in view, viz., the improvement of the Pelargonium in form, novelty, brilliancy, and beauty of colour, freedom of bloom, and habit of plant. The judges will be two nurserymen, two amateurs, and a fifth appointed by the Committee of the Royal South London Society. Any raiser is at liberty to compete, and no entrance money is required.

MESSRS. J. AND H. BROWN'S New List of Bedding out Plants can be had by post, and the following Select Plants immediately sent to any part.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

COOPER'S PATENT PRESERVED FRUITS IN SYRUP, prepared for the Dessert.—A small hamper, containing various kinds of Fruit, one of which contains Raspberries and Currants, the growth of the year 1840, and is still warranted for three years in advance, for family use. A hamper will be forwarded, free of expense, to any part of London, for an order for 7s., directed to Mr. JOHN SMITH, 8, St. John-street, Clerkenwell, London.

NETTING, FLAGS, AND BUNTING.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3d. per yard 2 yards wide, or 6d. per yard 4 yards wide. Woollen Bunting, any length or width, at 6d. per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

DESTRUCTIVE ANIMALCULÆ.

READ'S GARDEN ENGINES AND MACHINES.—As summer approaches, the larvæ of destructive insects are propagated in infinite multitudes, to the great injury of the young shoots of Trees, Vines, Plants, and every species of vegetation put into motion and growth by the genial influence of the season. RICHARD READ, Instrument Maker (by special appointment) to her Majesty, begs to inform Amateur and Practical Gardeners, &c., that he has made considerable improvement in his Garden Engines and Machines, which are now so perfect that he will warrant the valves to keep in repair during the term of the patent.—Manufactured only at 35, Regent-circus, Piccadilly.

MARQUEES, SUN-BLINDS, RICK CLOTHS, &c.—Manufactory, Old Kent-road, facing the Bricklayer's Arms Railway Terminus, and 17, Smithfield-bars, London.

"The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee,
This tent for our dinner, and that for our tea."

Marquees and temporary rooms superbly fitted up for fetes, &c., on most moderate terms, by THOMAS EDGINGTON and Co.—Tents of every description, Rick-cloths, with poles, &c. Tanned Netting, for the protection of fruit-trees from frost, blight, and birds, and for the security of fresh-sown seed either in gardens or fields, at unprecedentedly low prices, viz., 1d. per square yard, or 200 yards for 14s., or 500 yards for 30s., or 1000 yards for 50s. Sold to gardeners and shopkeepers by the cwt. —New Archangel Mats and Scrim Canvas for wall fruit; Tarpaulings for houses under repair, on hire. Orders and inquiries per post immediately attended to.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

MONTGOMERY'S RAFTERS AND SASH BARS, FOR GREENHOUSES, SKY-LIGHTS, &c.

Prices of Sash Bars, Rafters, &c., including Waste, per 100 ft.

Glass Shades; Tiles and Slates of any size; Wasp Traps, 3s. 6d. per dozen; Lamp Shades; Rough Plate Glass of every thickness. Lactometers, for trying the quality of milk, 4 tubes, 7s. 6d.; 6 do., 10s. Glass Stands for Pianoforte, and every article in the trade.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅜ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

EXOTIC AND INDIGENOUS FERN SEEDS.

WILLIAM MAY, F.H.S., begs to announce to the admirers of this interesting group of Plants, that he has been presented with a Collection of Seeds from one of the most celebrated growers in this country, consisting of 60 distinct species and varieties, which will be sent, post free, on receipt of 20s.—The Hope Nurseries, Bedale, Yorkshire, May 25.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.

MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21s. each.—Bagshot Nursery, Surrey.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

ACHIMENES TUGWELLIANA.—This beautiful Achimenes was raised by Mr. Carmichael, gardener to G. C. Tugwell, Esq., Crowe Hall, Bath. It was the admiration of all who saw it in bloom, and the following opinions were expressed upon its merits:

"ACHIMENES: *W. C.* Your hybrid between A. patens and A. longiflora, with deep violet-purple flowers, about the size of those of A. patens, is a decided cross, and is a very beautiful thing, nice in colour."—*Gardeners' Chronicle*, August 11, 1849.

"ACHIMENES: *William Carmichael.* Your hybrid between A. patens and A. longiflora is distinct from both the flowers, being about the size of A. longiflora, with a colour intermediate betwixt the parents. It is undoubtedly a desirable acquisition to this already useful and ornamental class of plants."—Gardeners' Journal, August 18, 1849.

R. GLENDINNING possessing the whole stock of the above desirable Achimenes, will be prepared to send out good plants the first week in June, at 7s. 6d. each. For every three ordered one extra will be added.—Chiswick Nursery, near London.

VALUABLE HARDY CONIFERÆ.—This being the best season for planting out these important Ornamental Trees, the following are offered as some of the most desirable of the hardy species. They are especially recommended as being all RAISED FROM SEEDS, none being either grafted or cutting plants. Many other species besides those enumerated may be obtained.

ROBERT GLENDINNING, Chiswick Nursery, near London.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, are now sending out young plants, strong and healthy, of all the best varieties of CHRYSANTHEMUMS for autumn flowering, at 9s. and 12s. per dozen; the newest sorts at 18s. per dozen; and good free flowering sorts for planting in the open borders, 50s. per 100.

The Plants are in small pots, and in good order for packing. A Descriptive List may be had on application.

It is requested a Post-office order may accompany all orders from unknown correspondents.

RENDLE'S CHEMICAL PLANT MANURE.—We have just received the following letter from Capt. JAMES WILLIAMS, R.N., Newport, near Barnstaple.

"Newport-terrace, Barnstaple, May 14, 1850.

"Sir,—I acknowledge the receipt of another supply of your Chemical Plant Manure, and I have very great pleasure in informing you of the beneficial effects I have found it produce on my plants in general. I am certain a short trial of it will be satisfactory to any person using it. I find my plants *strong and full of flowers*, particularly my Geraniums, which are grown in very small pots, producing now, at this time, *fine trusses of flowers, large*, and *their colours clear*. On my Calceolarias it has an *astonishing effect* in the produce of flowers, both in quantity and size; with regard to Petunias the same. I now use it in the compost of all my greenhouse plants. I have so far been successful in the quantity I have used—one pint of manure to two pecks of compost; and as it is *inexpensive*, I wish you a successful sale, and trust that your customers will be as well satisfied as I am.

"I remain, sir, yours truly, JAMES WILLIAMS."

"P.S. I shall most assuredly recommend all my friends to use it."

Samples can be had gratis, by enclosing six penny postage stamps to pay the postage. Sold in tin canisters, at 1s., 2s., and 3s. 6d. each, warranted to give satisfaction, or the money will be returned.

Apply to WILLIAM E. RENDLE & Co., Union-road, Plymouth.

HENRY BIERTUMPFEL, MANUFACTURER OF IMPROVED AND PATENT GARDEN SYRINGES, AND ORNAMENTAL ICE MOULDS, 68, Albany-street, Regent's-park, London, respectfully tenders his thanks to Gentlemen, Florists, Nurserymen, &c., for their continued and extending patronage, and ventures to hope that he may still be honoured with their commands. To those who have not at present used his Improved and Patent Garden Syringe, he respectfully solicits a trial, as he can confidently recommend them to be unsurpassed either for durability, cheapness, or utility; and being manufactured of the Imperial White Metal, they never corrode or cause verdigrease, to which the brass ones are liable.

H. B. would also take this opportunity of calling attention to his New and Ornamental Ice Moulds, they being a very great improvement upon the old shape. They are used and approved of by some of the first Club Houses in London, and by all the most eminent Confectioners, and are particularly admired for their elegant and unique shape.

N.B. Made in Pints, 1½ Pints, Quarts, and 3 Pints.

WORTON COTTAGE MEETINGS.—Raisers of Seedling Florist Flowers sending them to these meetings for the censors of BECK'S FLORIST AND GARDEN MISCELLANY are earnestly requested to be particular in packing them carefully, and in suitable tin boxes. They must be addressed, Mr. BECK, Worton Cottage, Isleworth, and be posted so as to reach him on the morning of the meetings.

The next Meeting will be held on Wednesday the 29th inst.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50	best new sorts	25s.
25	ditto	15s.
12	ditto	9s.

Well established in small pots, or per post free.

Their successful mode of cultivation is published in the *Gardeners' Chronicle* of Saturday last.

THE NEWEST AND MOST BEAUTIFUL PLANTS FOR BEDDING OUT can now be supplied by YOUELL and Co., comprising the most distinct and striking varieties of recent introduction, at 4s., 6s., 9s., and 12s. per doz., viz., Fuchsias, Verbenas, Petuniaa, Antirrhinums, Anagallis, Bouvardias, Calceolarias, Chrysanthemums, Cupheas, Carnations, Geraniums (scarlet and fancy kinds), Heliotropes, Lantanas, Lobelias, Lychnis, Mesembryanthemums, Nemophila maculata, Pansies, Pentstemons, Phloxes, Salvias, Double White Rockets, Zauschneria, &c., of which Catalogues can be had on application.—Royal Nursery, Great Yarmouth.

The Gardeners' Chronicle.

SATURDAY,	June	1	Royal Botanic Gardens (American Plant Show)	2 P.M.

COUNTRY SHOWS.—Tuesday, May 28: Whitby Floral, and Manchester Great Northern Tulip.—Thursday, May 30: Saltiouse Village Horticultural.—Friday, May 31: Darlington Horticultural.

WE entirely agree with the judgment of those who, on looking at parts of the EXHIBITION of flowers and fruit AT CHISWICK on Saturday last, declared that cultivation could go no further. It can go no further. We may see larger specimens, and greater variety, and more novelty, perhaps; but we shall never see better gardening. There was scarcely an ill-grown plant in the tents. The Roses, the Azaleas, the Heaths, the Orchids, and the various races of "Stove and Greenhouse Plants" were so many living fountains, from whose bosom poured a magnificent stream of wondrous forms, gay colours, and sweet odours.

"I don't see much novelty here," said a foreign gentleman, looking at the Orchids, of which he possesses a vast collection; "I think I have all that is brought to-day; but how *do* the gardeners make them *grow and flower in this wild profusion*." That is just the point; money will make a collection of plants; but skill alone will make them flourish.

Foremost among the wonders of the day were specimens in flower of THE VICTORIA, two leaves and a flower from the Duke of DEVONSHIRE, one leaf and a flower from the Duke of NORTHUMBERLAND; all in a state of admirable beauty. No description can give an idea of what this plant is; we may say, indeed, that its leaf is 15 feet in circumference, and like a huge tray, that it is sustained upon the water by purple ribs 2 inches deep, that its stalk resembles the pipe of a Hookah, that it is half pierced by thousands of microscopical chimneys, and coated next the water by millions of millions of glands (?), and that the whole fabric is the result of one week's growth. Yet to feel the force of this description, the leaf must be seen. Fortunately the flowers were in perfect order, and during the afternoon expanded very nearly, throwing off now and then volumes of fragrance which diffused itself around whenever the glasses which protected them were removed. Although no opportunity was afforded of a minute examination of their structure, yet there was evidence enough to show that Victoria is no GORGON, as some dreaming gentlemen still fancy.*

Among other novelties the first place was occupied by the *jasmine-flowered Rhododendron* from Messrs. VEITCH, of Exeter—an evergreen greenhouse bush, with long, narrow, waxy, white flowers, possessing a delicious fragrance. As it was stated to have been referred to Rhododendron by Sir WILLIAM HOOKER, we presume that the genus has been certainly ascertained.

Then came a beauteous Hovea, something like CELS's, but with very broad leaves, raised from New Holland seeds by the gardener to Mr. HENRY BERENS. This promises to be more manageable than CELS's Hovea, and if so it will be a great acquisition.

A most curious thing should next be mentioned, of which a well-grown plant came from Messrs. VEITCH, of Exeter. This was *Lobb's Bolbophyl*, a very remarkable stove plant, with large Maxillaria-like flowers, curiously spotted and striped with buff.

Inferior to these, but still of much merit, were the *transparent Dendrobe*, and the *fringed Stylewort*, both from Messrs. VEITCH, of Exeter; the former with gauzy white and pink blossoms, and the latter with flowers of the palest chalky yellow. The *great bracted Medinilla* was also there, but as a cut specimen, and injured in the carriage.

Of plants less novel the most striking was a large handsome specimen of the *plaited Gueldres Rose*, a Japan shrub, originally imported by the Horticultural Society, but on this occasion exhibited by Messrs. STANDISH and NOBLE, of Bagshot. By some mistake it was placed in a wrong class, and was, therefore, passed over by the judges; had it been in its proper class, it must have taken a first prize, for it was the finest thing among the non-novelties.

In another column will be found a full account of this remarkable exhibition, which, it must be allowed on all hands, was a triumphant example of our native skill and industry. The visitors to it, however, as always happens in May at the Horticultural Society's meetings, were more remarkable for their selectness than their number; so that, notwithstanding the issue of an unusually large number of tickets, the official returns do not show a greater attendance than 3142.

We may add that the new arrangements for facilitating the access to the tents, and for the accommodation of exhibitors, appeared to be universally considered as great improvements in the appearance of the Garden. Fortunately, however, their value as a protection against rain was not put to the test; for the day was dry, although chilly and frequently overcast.

* We believe we are correct in saying that the French notion still exists in England of Victoria being the same genus as Euryale!

IT is with many painful feelings and recollections that we have to announce the untimely death of Dr. CORDA, of Prague, who perished at sea on his return from Texas, where he had been residing 10 months, during which he had made many valuable collections and observations that, we fear, are now entirely lost to science. He was unfortunately implicated in the political agitation of his native city, Prague, in 1848, where he had a narrow escape from assassination. Being a man of very varied talents, and by no means a mere botanist, he had been employed by the Emperor of AUSTRIA to report on the Industrial Exhibition at Paris in 1844, where we had the pleasure of his society for some time; and a high sense of his abilities induced the Prince COLLOREDO to select him, as a fit person to conduct a large party of emigrants to New Braunfels, in Texas, where the Prince was about to establish a colony. His passage had been taken in the ill-fated ship from Bremen, which perished on the Kentish coast in the autumn of 1848, and while we were yet in doubt as to his escape, we had the pleasure of receiving intelligence from him from the Isle of Wight, announcing his safety, in consequence of being obliged to delay his voyage.

His contributions to mycology, and other branches of botany, were of first-rate importance, but they were, in some degree, impaired by too much haste, which led him sometimes into errors, and from a certain exuberance of fancy which induced him to jump to his conclusions without being sure of all the intermediate steps. There was, unfortunately, something of the same fault in his conversation as well as in his writings, which excited a prejudice against him in those who either did not know him well or were not disposed to make a little allowance, but he was sincerely esteemed by a large circle of friends, many of whom, as Baron STERNBERG, for instance, had considerable influence, who knew his kindness of spirit, and admired his undoubted talents. His "Icones Fungorum" contain a mass of observations, a great portion of which are entirely new to science; and we can vouch for the accuracy of a large part of the figures from the comparison of authentic specimens communicated for the express object of testing their correctness, which had been called in question rather unfairly. As a draftsman he was excelled by few. The "Prachtflora" is one of the most beautiful specimens of illustration with which we are acquainted. The figures in the grand work of "Krombholz" are all from his pencil, and indeed the text was also supplied by him. His magnificent work on fossil plants is one of the most valuable contributions to structural botany, and we have not only had the opportunity of examining the very specimens figured, and comparing them with the original drawings, but have, through his kindness, received several of his most interesting genera. Before he left Germany, drawings on stone were made for a sixth fasciculus, a vast portion of which consisted of Truffles. A complete set of the proofs was fortunately communicated to Dr. MONTAGNE, and an imperfect set is in our own possession. We trust, however, that the publishers, in whose hands the stones were left, will print them for general

circulation, even though they should be obliged to publish them without text.

It is intended shortly to dispose of his collections, but we fear that many of the subjects figured in the earlier fasciculi were lost, as appear from his private correspondence, which is the more to be regretted, as several of the figures are neither so accurate nor so well designed as in the later numbers.]

A COMMUNICATION was made at a late meeting of the Linnean Society respecting a peculiar form of DRY-ROT which spread with extreme rapidity in the church of King's Wear, Devonshire, by means of long, byssoid, rope-like shoots, different in the mode of their development, except on a very small scale, from anything which had before come within our notice.

A still more curious case, which we are inclined to refer to dry-rot, has lately been sent to us for inspection, reminding us of the mural leprosy of Judea, attacking, as it does, and more or less destroying not merely the timber, but the solid walls themselves. It occurred in an old house near Erith, on the banks of the Thames, where it has penetrated into every crevice in and between the walls and wood-work, separating the bricks and mortar, and rendering the whole so friable that the walls must be rebuilt, to prevent their falling down. The mycelium here forms a widely expanded net-work of threads, which are twisted together in every possible way, so as to form anastomosing strings, of considerable tenacity, as thick as small pack-thread. A strong solution of corrosive sublimate is an effectual cure for such affections, where it is possible to apply it; but where, as in the present instance, the plague infects the whole substance of the structure, destruction seems to be the only remedy. The circumstance of the mycelium penetrating into the mortar and brickwork to such an extent appears to be new, at least we do not recollect to have heard anything of the kind before.

It cannot be positively asserted, in the total absence of hymenium, that the mycelium is actually that of Merulius lachrymans, as there are seldom any distinctive marks by which the spawn of one fungus can be accurately known from that of another more or less allied species, and there are several besides the true dry-rot which pass under the common name. Many species concur frequently in the same ship in the work of destruction. Thelephora puteana is frequently the cause of dry-rot, wholly unaccompanied by the Merulius; and we have seen a large hothouse destroyed conjointly by Dædalea quercina and Polyporus versicolor. In Germany the Hausschwamm or domestic dry-rot is frequently due to a species of Polyporus (not yet observed in this country in such a situation, though it has been found near London on Fir stumps), whose development is said to be greatly favoured by the presence of foul air from drains, or other receptacles of impurities.

WE learn from Messrs. LOW and Co. that one of the STANWICK NECTARINES, purchased at the sale the other day, was for Mr. WOOD, of the Nursery, Huntingdon; and from Messrs. GARRAWAY, MAYES, and Co., of Bristol, that the plant purchased by Messrs. HURST and M'MULLEN was on their account.

AMONG our advertisements will be found an announcement of the sale of a part of Mr. BATEMAN'S great collection of ORCHIDS, in aid of the funds of a church to be constructed in that gentleman's parish. We understand that all Mr. BATEMAN'S finest specimens and rarest plants will be brought to the hammer on this occasion, some of the former being of from 10 to 15 years' growth.

ON HUMUS AND MANURES.

By M. E. SOUBEIRAN.

M. E. SOUBEIRAN addressed to the academy the resumé of his treatise on humus, and the part which manure plays in the nourishment of plants; this treatise having received the prize at the meeting of the Central Society of Agriculture of the Seine-Inferieure.

1. The woody fibre, which undergoes decomposition on contact with air and moisture, is converted into humus, and at the same time furnishes carbonic acid, which is perhaps absorbed by the roots of plants.

2. The proportion of carbon in humus and manures never exceeds 56 to 57 per cent. This is the extreme limit which the decomposition of woody fibre can attain to in contact with air and moisture.

3. Pure humus contains $2\frac{1}{2}$ per cent. of nitrogen, which appears to be essential to its composition.

4. Humus is scarcely altered in contact with air.

5. Humus, scarcely soluble of itself in water, acquires solubility by its combination with lime; but the principal agent of its solution is the carbonate of ammonia, which reacts equally on free humus, and on humus combined with calcareous matters.

6. Humus rendered soluble, is absorbed by the roots of plants; it serves in a direct manner for the nourishment of the plant.

7. Humus has also a favourable action on vegetation, by attracting and retaining the moisture of the air and ammonia, by facilitating the solution of the earthy phosphates, by ameliorating the physical qualities of the soil, and by moderating and regulating the decomposition of decaying animal matters.

8. Manure *par excellence* is that which at the same time contains the earthy and alkaline salts, ammoniacal salts, animal matter in a state of putrefaction, humus already formed, and vegetable remains in a state of transformation.

9. In valuing a manure, it is necessary to take into consideration not only the quantity of nitrogen furnished by analysis, but also the state in which that nitrogen exists in the manure; also the state of the ammoniacal salt, or of the putrescible animal matter, and the state of the soluble ammoniacal salt, or of the ammoniacal magnesian phosphate.

10. The analyses of fermented dung which have hitherto been made are defective, in that they have not taken into calculation the loss resulting from the action of carbonate of lime on the salts with an ammoniacal base, during the drying of this manure. The result is, that the tables which have been published, representing the proportion of nitrogen in manures, give only approximate results.

11. The comparative value of manures cannot be estimated by simply reckoning the quantity of nitrogen afforded by analysis; because, on the one hand, the nitrogenous matters are not the only active principles of manures; and on the other hand, because the value of manures depends much on the state of the nitrogen contained in them; and consequently it is impossible to frame a table of equivalents for manures.

DISEASES OF PLANTS.

(*Continued from p.* 309.)

MUCH has been written on the means of preserving our lands from the ravages of the Grillus grillotalpa, *L.*, (called by us *grillotalpa, zeccajuola, zuccajolo* or *baco da zucche*, and by the French *courtilière*). It may be true, as Bosc asserts, that it is carnivorous, not herbivorous, and that it cuts off plants in the search after insects; but it is not the less true that it is one of the greatest enemies of our gardens, Rice grounds, &c. Passing a heavy roller over the ground in the early spring is a practice much vaunted, but of little use. Deep ploughing in the middle of winter will cause many of these insects to perish. It is certain that every female that is killed prevents the development of 800 to 1000 eggs which she bears. Some sink into the earth vessels full of water into which these insects fall and are drowned. A more certain way is to pour water into the holes of these grillotalpa, and when full to the level of the ground drop a few drops of oil on it. The insect endeavouring to escape from the water has its organ of respiration covered over and choked by the oil and perishes. If the owner of a small garden takes this method of destroying the first grillotalpa he sees, he will stop the evil at its commencement, and thus avoid great future havoc.

Coleoptera are doubly injurious. In the state of larva they kill many plants by attacking and lacerating their roots. When perfect insects, during the few moments of their lives, they feed on the leaves and flowers of many plants. Among their number one of the greatest enemies to all vegetation, in the state of larva, is the cockchafer, or Scarabœus melolontha, *L.* It lives several years in that state. There is but one way of getting rid of it. When it is perceived that they are much multiplied in a piece of ground, let Lettuces be sown upon it. These larva are very fond of them, and they will all attach themselves to the young plants, and may thus be exterminated in the course of a few hours. In the spring also all those that are found in the perfect state should be destroyed, they are always abundant along hedges and ditches. This plague is greatest after mild winters and moist springs. It has been observed that most of the beetles which attack corn are much more readily developed if the eggs are deposited under patches of cowdung; these ought therefore never to be left lying on pasturages, especially on artificial meadows.

Amongst hemiptera the greatest injury is caused by the grillotalpa in its perfect state. But the numerous series of bugs, aphides, cicadæ, cocci, and flower eaters, are the more fatal the less we are able to guard against them. I am well aware how many fumigations have been invented to destroy them, but all require great caution in using them. I have observed, however, that their ravages are always much less where the ground has been well worked and kept in perfect order, and where the manures used have been well fermented and laid down at the right season. To destroy the [gorgoglioni]* which make such havoc among Cabbages, it is recommended to sow Rape seed amongst them, which the insects will attack, in preference. Some persons, like Gullet, in the "English Transactions" have asserted that the crops have been preserved from these insects by passing branches of Elder over them, and the experiment is also said to have been successfully tried with us.

By the lepidoptera of our country our crops are more frequently destroyed. Caterpillars, which are no other than their larvæ, strip branches of their leaves, penetrate into fruits and eat out their substance, cut off stalks, suck out the fluids, and sometimes suffocate plants with their webs. In the perfect state they are only injurious from depositing their eggs in plants. A very useful practice, which may very much diminish the dissemination of the eggs, more especially of moths, is the lighting a number of small fires at night. The moths fly into these fires, and great numbers are thus destroyed. As their larvæ are generally developed in the earth or on herbs rather than on trees, these burnings to which I have previously alluded, ploughings in the winter and early spring, and frequent changes of crops, are the best preservatives. For those lepidoptera that propagate upon trees, or climb them for their food, it is indispensable to destroy their nests. It has been observed that many lepidopteræ select for the deposit of their eggs dead stumps and broken branches, where there is rough dead wood, thence the importance of cutting all branches off clean and covering the wound with clay and cow-dung. Butterflies and moths are said to be kept away by the smell of dung. The taking caterpillars' nests is often practised, but the season selected is not always the right one. It commences in August and ends in February. Later than that there is danger that the remedy may be insufficient. Sufficient care is likewise not taken to burn the nests. A countryman who had with great care cleaned his trees, complained that they were nevertheless devoured by caterpillars, which he attributed to the season. On inquiry I found he had followed the usual practice of throwing the nests on the ground, and as the caterpillars were hatched they returned to the tree. For those caterpillars which are not bred on trees, but climb them for their food, which they generally do by night, the stem of the tree should be smeared with a ring of some thick glutinous matter to which the caterpillars in mounting will adhere, and may be easily taken in great numbers. I say nothing of aspersions and fumigations, as experience has taught me how useless they are.

It does not appear that neuroptera do any mischief to terrestrial plants, possibly it may be otherwise with aquatics.

Amongst hymenoptera, a few do mischief. Thus the cynips in laying its eggs produces galls, the calabrone [humble bee?] which with a kind of double saw cuts off the shoots of the Rose, for instance, in order to lay its eggs; and finally, the ant, which, though defended by many, commits nevertheless great ravages in gardens. All the contrivances of gardeners for the destruction of these insects have been hitherto attended with but little success. Fabbroni found that pouring upon their nests a few drops of a mixture of red-lead and honey, of the consistence of a syrup, disperses them, but even this method has not succeeded with me.

The diptera, as for instance flies and gnats, seem to confine themselves to flowers; and finally, among aptera several bugs, lice, spiders, &c., are injurious to plants.

In order not to exceed my limits, I will not enter into any further details on the destruction of insects, but I must say a few words on three genera of animals, which commit great ravages in the country, though they do not belong to the class of insects; one is the earthworm, of the class of worms, the two others belonging to mollusca, are the snail and the slug.

It is true that earthworms, by dividing and turning up the soil, are often of advantage in agriculture, but they also disturb and expose the tender roots of young plants. The best means of preserving gardens from them is keeping the soil dry. Some persons chase them, by pouring a quantity of water into their holes, which causes them to come to the surface, when they are easily taken.

Complaints are everywhere heard of the ravages of snails, of which there are several species known. I cannot here do better than transcribe the words of the celebrated Bosc, author of the article Helice in the "Nouveau Dictionnaire d'Histoire Naturelle." "Thousands of receipts for the destruction of snails have been published, but the only good one is the killing them one after another. A careful gardener will therefore make the tour of his garden early in the morning, and take all he can find. It is especially after summer rains that snails in the day-time issue forth from their hiding places, and it is at such times therefore that a particular search should be made for them." My own experience fully confirms what Bosc has said. I have tried a number of secrets, and all have proved useless.

* Ré generally calls aphides by this name, but it is applied to all small insects which are gregarious, and here he must mean something like the Turnip fly.

VILLA AND SUBURBAN GARDENING.

SUCCESS in gardening, in many cases, depends more upon continual watchfulness than on skill. Peach trees at this season are either preserved or destroyed, according to the attention now bestowed on them. Hot sunshine, for a few hours during the day, does much mischief; it causes swarms of green fly to spring into life; this sunshine is succeeded by dry easterly winds at night; these prevent the deposition of dew, and therefore all circumstances are favourable, as far as natural provision goes, for the destruction of the foliage. Little as my amateur readers may know of vegetable physiology, it will require but few lessons, or study, to fully comprehend how valueless a fruit tree—more especially one whose fruit is supposed to be set—must be when the leaves are either rendered useless as regards their necessary and natural functions, or the tree entirely denuded of them. The vegetable economy at this peculiar season is in the highest possible degree of excitement. Almost every plant is like a cauldron at the boiling point just about to run over. Nature, however, provides for the plant leaves which elaborate the excess of sap, and new combinations are formed, unless some event transpires to interfere with the ordinary laws by which vegetable life is controlled and regulated. When its foliage is destroyed, the Peach tree in an

especial manner suffers more than any other fruit-bearing plant I know of. The immediate effect is, that the warmth of the sun during the day excites the sap to such a degree that all the sap-vessels burst, and extravasated sap may be observed on all parts of the tree. A few hot sunny days expel the moisture from the extravasated matter, and it then assumes the form of gum, which envelopes every branch or twig in a thousand different places, until the tree actually expires in its grasp. Do not suppose that this is an overdrawn picture; I could point out where this has already occurred in one or two favoured counties, and even in their most renowned gardens. Trees, nay whole walls of the finest Peach trees, which the eye would have desired to look upon, are this season already numbered with the things that were. The amateur must, therefore, take measures of a precautionary kind as soon as possible, in order that the evil may be avoided. It would be wise, previous to the spring nailing or tying, as the case may be, to coat the trees well over in every part with the following mixture: 1 lb. of black or soft soap, ½ lb. of flowers of sulphur, and ½ lb. of tobacco; let these be well mixed in 4 gallons of boiling water. Strain the mixture through a sieve, and add sufficient soot to thicken it to the consistence of cream. Keep the mixture at a temperature of 150° at least, and cover every crevice of the tree with it, laying it on with a painter's brush. As soon as the foliage begins to open, keep a watchful eye, in order to detect when the larvæ begin to breed; then remove any leaves which are curled, and apply the above mixture reduced one-half, leaving the soot entirely out. Be careful that it reaches every crevice; and when the fruit is set, and the mornings mild, apply it also with the syringe. *Pharo.*

LONDON PARTICULAR GUANO.

Take of genuine guano 2 cwt., worth ...	£1	0	0
„ dried loam, 10 cwt., worth ...	0	10	0
„ blue Billy, 4 cwt., worth ...	0	0	0
„ ground stones, 4 cwt., worth ...	0	4	0
	£1	14	0

This makes capital guano, worth, among country flats, from 7*l.* to 8*l.* per ton.

Another Sort.

Genuine guano, 1 cwt., worth ...	£0	10	0
Dried loam, 10 cwt., worth ...	0	10	0
Blue Billy, 5 cwt., worth ...	0	0	0
Ground stones, 4½ cwt., worth ...	0	4	6
Ground coprolites, ½ cwt., worth ...	0	1	6
	£1	6	0

This is a particularly first class article, which by analysis will be provable to contain phosphates.

N.B. Where it can be had cheap, pounded limestone may be substituted advantageously for ground stones; unless it should be more profitable to sell it as bone dust.

Copied from a paper picked up in Mark-lane, and supposed to have been dropped by a guano merchant.

Home Correspondence.

Tender Aquatics.—The account given, May 18, of the Victoria regia, at Syon House, "that it has not only been grown, but flowered in the short space of three months in a slate tank," leads me to ask whether it would by any possibility, live and grow in water of the summer temperature, not of our running streams, but of our artificial and ornamental ponds, which is much higher. Is it one of those plants which require stove heat to keep it alive, or is it only tender in the usual gardening sense, namely, that the least touch of frost will destroy it? Because, if like the Calla æthiopica, it is only tender in the latter acceptation, it might be grown with advantage as a tender aquatic annual, by being raised in a stove, planted out at the end of May, with the prospect of affording a superb display of foliage and flowers, at least during the month of September. The introduction of a few showy robust summer-growing aquatics that would not stand our winter, would be most acceptable. They could answer their purpose and be renewed at pleasure without becoming the serious nuisance into which our native aquatics grow, beautiful as several of them are, if incautiously introduced into still waters, where the conditions are favourable for their increase. I have lately been carting away loads after loads of Water Lily roots, white as well as yellow, with some degree of sorrow, that their encroaching disposition should compel one to decline their acquaintance altogether; but if the Victoria regia could be made to occupy the now clear water, even for a month or two, I would endeavour to introduce one as soon as the plants become a little more easily procurable. *D.* [You can do nothing with it unless the water is 80°, and the temperature of the air which surrounds it at least as high.]

Cheiranthus Marshallii.—I see by the account of the show at Regent's Park, that you noticed my new Cheiranthus as being violet scented, and as being represented to be so by me. I believe the plant shown was one I sent through Mr. Moore, of the Chelsea Botanic Garden, and it may, by a "*lapsus calami*," have been so described by me. The plant in question, however, will remind those whose olfactory nerves are in right order more of honey than Violets. It is of the character of Galium verum and some other common plants, and, while strong, is not overpowering. You will doubtless ere long have an opportunity of testing it yourself, as I have every expectation it will become a very popular plant. It is a hybrid between Erysimum Perofskianum and Cheiranthus ochroleucus. *R. M. Stark, Edinburgh.* [To us the smell is more that of Violets than of honey.]

The Weather on the 3d of May.—In reply to "T. R.," I beg to state that on the morning of the 3d of May the thermometer stood here at 39° at 7 A.M. The lowest point registered during the night was 29°. —*Subscriber, Southborough, Tonbridge Wells, May* 14. ——In your Nos. of the 4th and 11th of May, mention has been made of the extreme cold which has occurred in the months of March and May. The following extracts from my journal show a simultaneity in the changes of temperature, although the precise degrees of cold do not correspond. The month of February was mild, the monthly mean being nearly 5° above the average of the last 35 years. The month of March was cold, more especially the last 10 days; the lowest temperatures on the nights of the

Date.	Five feet above the surface of the ground.	Radiator.
25th	20°	15°
26th	23	17.5
27th	20	13
28th	21.5	15
29th	31.8	27

The temperature of the dew point on the 25th, at 5h. 30m. P.M., was 20°; the sky was clear until midnight, after which snow fell to the depth of half an inch. On the 27th, between 6 and 7 P.M., a heavy shower of snow fell, which was succeeded by a clear night. In March there were 18 frosty nights. The temperature of April was above the mean until the 20th; during the last 10 days of the month the N. and N.E. winds prevailed, and the day temperature did not once rise to 60°; neither did the night temperature, at 5 feet above the surface of the ground, fall below the freezing point. The temperature from radiation receded five times below the freezing point; the minimum of cold was 28°. The month of May has been remarkable for its very low day temperatures; the temperature at night has fallen but once below the freezing point, which was on the night of the 2d of May, when the thermometer, at 5 feet above the surface of the ground, receded to 30°, the night being calm and clear, and the upper current from the N.E., the temperature from radiation fell to 23°; the subsequent nights being generally cloudy, no other degree of extreme cold has been registered. The mean temperature of the first 10 days of May was 45.5, which is about 7° lower than the average of the last 35 years. The low temperature at Oswestry on the 27th March may have been the consequence of a locality favourable to radiation, the effects of which would be greatly increased if the ground were covered with newly fallen snow. The temperature of the air at Sawbridgeworth on the 2d of May was 23°, the identical degree of cold from radiation at Greenwich on the same night. *John Henry Belville, Hyde Vale, Greenwich.*—A thermometer here, hanging 2 feet above the ground, and 20 feet from a south wall, registered 26° on the 3d of May. About two-thirds of the Peaches are dead. Early Cherries, Pears, and Plums are very much injured; they all looked well before the 3d of May. *S. Smee, Gosfield, Essex.*—The thermometer, a good one, made on purpose for Dr. Reid's use in the House of Lords, by Bennett, Cheapside, who makes for the Royal Observatory, marked 25° on 3d May. It is placed 3 feet from the ground, 3 feet from a wall, at the edge of a gravel walk, against a piece of board at the top of a post with a screen over it, pointing N. by E. Soil gravel. Locality between London and Dartford. Strawberries hurt, those that were out and the buds ready to open. Pears, including Duchess D'Angoulême, Beurrés, Coupan, Sweetwater, Marie Louise, Lammas, Gansell's Bergamot, Glout Morceau, Bon Chrétien, Chaumontelle, Bishop's Thumb, are heavy still, but do not appear to swell. Gooseberries suffered. Bigarreaus suffered; the blossom still most abundant. Bees busy on the Apples now in full bloom, but the blossom exceedingly pale. Wall fruit uninjured. Box edging much cut at the top. *Este.*—Although the frost of the night of the 2d inst. was severe enough to form ice of considerable thickness for the time of year, the nights of the 13th and 14th were more destructive at 100 miles N. of London. Potatoes turned quite black, and the Plums have been falling off by dozens since. Pears have escaped better, especially those with strong leaves. We have several of the choicer kinds on espaliers, which have been protected by the cotton frame net at 6*d.* a yard, 8 or 9 feet wide, which appears to have sheltered the blossoms. A Brown Beurré on a wall, E.S.E., which has never escaped damage, has set an abundant crop so protected; and even if only a quarter should remain on the tree, there would be sufficient. I have no faith in acclimatising plants. The fine old sorts of Pears, such as the above, or the Chaumontelle or Colmar, are not one step hardier than ever they were. *Amateur.*

Araucaria imbricata.—What is the cause of the leaves of Araucaria imbricata turning brown, in patches of 2 or 3 inches, more or less, principally near the extremities of the branches? There is generally only one patch on each branch. White moss is beginning to grow on the plant. I have another planted in the same year (1846) which made very fine growth in 1847 and 1848, but last year not so good, and this spring I observe an odd leaf turning brown, although to all appearance the plant is very healthy, and promises to make a fine specimen. I am situated in one of the wettest and most cold backward parts in the south of Ireland, 30 miles east of the Atlantic. Are A. imbricata and A. lanceolata much alike? A gentleman once told me that I had the lanceolata amongst my young plants; I could never observe any distinct difference. Is A. lanceolata equally as hardy as A. imbricata? *K., County Cork.* [The mischief is probably produced by wet. If by A. lanceolata is meant the old Pinus lanceolata, now called Cunninghamia sinensis, it is not so hardy as A. imbricata.]

The Cuckoo.—Has any one remarked the unusual absence of the cuckoo? Most certainly for the last three or four years its song has been but little heard in this part of Kent. I have seen three at a time in my orchard a few years ago; now I never see them, and others remark the same. *Este.*

A Country Gardener's Jottings on the Chiswick Fête.—Such a May day as Saturday was, even old Herrick himself would have rejoiced at, and doubtless could the old lover of out-door amusements have revisited the earth, a special invitation to his Corinna to go a-Maying would have celebrated the occasion. And Maying it was in earnest, if sunny skies and happy faces, flowers of every hue and clime, and music the most classical, could in their combination constitute a May festival. For all these were present. And the glory of an English garden—a lawn of velvety turf, in the highest possible condition, formed no mean adjunct in the combination. But of the flowers staged for competition, what could be said of them more than, as a whole, the superlative of excellence was stamped upon them. To enter into a minute description is not the object of this notice. Those who were present need it not; those who were not fortunate to look upon them would gather but a slight gratification from a description. All I wish to do is to offer a few remarks from jottings made at the exhibition, and such as possibly will not form part of the official report. Of course the queen of the exhibition was the Victoria regia, flowers and leaves of which were exhibited; novelties which few of us had previously the good fortune to behold. The chaste beauty of the flowers forcibly reminded one of the exquisite lines which Mrs. Hemans has addressed to our own less attractive but no less elegant "queen of the lake:"

"Bright Lily of the wave,
Rising with graceful form at every swell,
Thou seem'st as if a spirit meekly brave
Dwelt in thy cell."

The large drawing afforded a good idea of the habitat of this wonderful flower, The exclamation of an enthusiastic foreigner as he entered the grand tent, and caught a perspective view of a combination of floral beauty not to be described—"Superb, superb!" will convey as full a description as is possible. And superb indeed it was. If the shades of some of our old gardeners who have "slept with their fathers for half a century, could again have tenanted their clay," and mixed with the busy scene, what exclamations would have escaped them, and how would they have extolled the industry and skill of gardeners, and the enterprise of gentlemen and ladies, by which such scenes are produced! Here, in one galaxy of beauty, were collected the minute and hardy denizens of the Alpine heights—regions of snows and storms—the Papilionaceous plants of New Holland, and all the beauties of the Cape. From the woods and plains of the tropics, Orchids of every hue, and fragrance, exhibiting forms as indescribable as their beauty. From every latitude, tropical, temperate, and frigid, the industry and enterprise of man had borne some trophy of his perseverance, and bade them blossom in a foreign climate beyond their natural wont. As one stood amid such a scene, and allowed the mind to wander beyond the mere glittering surface, beautiful as it was, and in fancy beheld the toils and anxieties, the hopes and fears, the proud satisfactions which claimed their birth from circumstances connected with it, how was the mere ocular gratification augmented by a higher and nobler one, a mental gratification. To particularise the Orchids would be next to impossible, suffice it to say they were magnificent. Stanhopea tigrina was unquestionably the queen. As one wandered along, the eye was caught now by the chaste Calanthe veratrifolia, the quaint spider-like Brassia maculata, or the Weeping Scuticaria Steelii; Phalænopsis amabilis, resembling nothing earthly but a quantity of white butterflies perched on a slender twig; the singular Acanthophippium bicolor, and the no less so Acineta Humboldtii, with the Vandas, Oncidiums, and Saccolabiums, presented themselves in such rapid succession, that each vegetable beauty seemed to give place to a greater. The remark of a lady when examining this department of the exhibitions was a just one. It was to the effect, that our artificial flower makers and designers for fabrics would do well to study from them more than at present they appear to do. I recollect seeing the other day in a window in Regent-street, a carpeting with designs of Orchids. It is needless to say how novel and rich was the effect. Amongst the plants claiming notice from their comparative rarity in exhibitions was Lyperia pinnatifida, a mass of rosy purple blossoms, apparently an ordinary greenhouse plant; Indigofera decora, a native of China, with beautiful pinnate foliage and racemes of blossom; Siphocampylos microstoma and Franciscea macrophylla. Amongst the Gardenias, of which there were several, Fortunii must bear away the palm—a more superb plant it would be difficult to imagine. The petals are of so fleshy a nature as to give the flower an appearance of richness not to be described. A fair admirer,

"Herself a fairer flower,"

compared them to Roses transformed to marble. Acrophyllum venosum, with the foliage of an Ilex and the flowers of a Spiræa, must not, however, be omitted. Signs of a better taste in many climbing plants was

exhibited in the specimen of Tropæolum, by Mr. Stuart. When will the old pudding-shaped trellis give way to something more in accordance with taste and elegance? And now a word or two on the tendency of such exhibitions, as affecting the gardeners. Unquestionably they offer a great stimulus to exertion, and in minds rightly constituted the result must be beneficial. Bringing together, as such exhibitions always do, the best flowers of the best kinds, and in the highest degree of development, they form epochs in the history of gardening, periods at which we can look back upon, and from which we can note the rapidity of our progress. And as a *fête*, a gala day to all the lovers of flowers—and who does not love them?—it affords a means of the fullest gratification—a gratification which, unlike much that we extol, brings with it no sting for the morrow. The pleasure is purely an innocent one; it involves no cruelties, it has no immoral tendencies. The secret of this is, it produces no false excitement. *L., May* 19.

Distribution of Sewage Water.—Can you inform me what is the best method of applying liquid manure to garden ground under the following circumstances? The garden, containing 12 acres, is attached to a public institution containing about 450 inmates. The main sewer runs through the centre of the garden, and four excellent catch pits have been formed along its course. The quantity of water used daily is 16,000 gallons. The surface soil is sandy loam, the subsoil white sand. I have an excellent double action force-pump, moveable from one catch pit to another; but have experienced difficulty and expense in the management and duration of hose for the conveyance of the sewerage water from the pump to the crops. I began with 100 feet of patent 1½ inch hose of hemp, woven without a seam, which answered well for one season, but at the end of the second season was rotten and useless. This hose, with three unions, cost 9*l.* 17*s*. It was therefore too expensive to replace, as it lasted so short a time. I have since made two attempts to replace it by a hose made of the best sail-cloth, sewn by the most skilful sail-maker I could find; but this substance cannot be made to bear the pressure of water, although dressed with boiled oil, pitchy compounds, or white-lead, all of which I have tried. The water escapes through numerous minute orifices, so that a jet cannot be produced from the end of the pipe, and without a jet I find it difficult to apply the water to garden crops. A length of hose filled with water is heavy, and if much moved about in garden crops, beats down and injures them, so that it is indispensable to have a good jet, by which the gardener may stand in one spot and water around to a certain extent without shifting his position or that of the hose. I wish, therefore, to know if any hose can be procured which is at the same time impermeable, durable, and reasonably cheap. My experience of leather hose in the brew-house informs me that it is too expensive and too apt to become brittle after moderate use for this purpose, and I hesitate to incur the expense of vulcanised India-rubber hose, which has been recommended to me, because I observe that this material, when used for other purposes, becomes in a year or two brittle and useless, and the cost of 200 or 300 feet would be considerable. I have tried to irrigate the garden with sewage water by means of shoots laid upon the ground, but find that a small stream passes into the porous soil and away, and that a large stream is apt to wash the soil from the roots of plants; however, under certain conditions of crop, and when the soil has been previously soaked with rain, I have found it more convenient to distribute the sewerage by means of shoot than by the force-pump and hose. At present, for want of a good hose, I am adopting the dilatory and inefficient plan of hand barrows and watering pots. Has not a successful attempt been made to convey some of the sewerage water of one of the large towns in Lancashire to the fields adjoining a canal by means of barges? If so, can you give me the name and address of the company? *J. C.* [Perhaps some correspondent who has had experience in this matter would have the kindness to answer "J. C.'s" inquiries. If his land sloped enough, we should have thought that pierced pipes, fed by a "head," would have been the most simple means.]

Preserving Fruit.—Perhaps some of your readers may be desirous of trying the following method (which I believe to be the best yet invented) of preserving small fruits: to every quart of fruit add 6 ozs. of moist sugar, bottle in wide-mouthed bottles in the usual way; place the bottles in a cauldron of cold water over the fire; when it boils, keep it boiling for 20 minutes; remove the cauldron from the fire, and cork the bottles very closely, immediately, tying them over with bladder; but as this operation is not easy to perform without removing the bottles from the water, it is essential that it be done as rapidly as possible, and the bottles returned to the cauldron, there to remain till the water becomes cold. Care must be taken not to expose the hot bottles to currents of cold air, nor to place them on cold surfaces, during the operation of corking, &c.; perhaps a doubled flannel, dipped in hot water, would be as good as anything else to place the bottles on. The lady from whom I received this receipt, ties her bottles down with double bladders, without corks, before placing them in the water; but I think the method I have described is preferable, as from the expansion of the contained air, by the heat in boiling, occasionally the bladders, and also the bottles, burst; and moreover the air cannot be so perfectly expelled, on which very much depends. By the usual methods of bottling much of the peculiar flavour of the green Gooseberry is lost, which by this way is preserved. I partook, two or three weeks ago, of some Gooseberries, preserved in this way, in 1848, and they were perfectly good, and retained the young flavour admirably. Rhubarb, cut ready for tarts, and preserved in this way, will be excellent. My informant preserves Plums, and the smaller fruits, Currants, Raspberries, Strawberries, and Berberries, by placing them in a deep dish, stratified with the same proportion of sugar, and placing them in a moderate oven; when sufficiently done, she transfers them into hot jars, as quickly as possible, and secures them immediately with double bladder. *Lusor.*

Mildew. — On entering the kitchen garden one morning last summer, I observed that the leaves of all the black Currant trees were thickly covered with mildew. I immediately watered them, by means of a rosed watering-can, with the collected contents of the bedroom-vessels, urinals, and wash-hand basins; and before 4 o'clock on the same day the mildew had entirely disappeared, and both foliage and fruit were preserved. *E. E., Penegoes.*

The Guano Trade.—A person who deals in hay and straw was here last night, and in speaking about business being so bad, said that he knew of only one business that paid, and that was the mixing up of manures for the farmers. His son is at work at a manufactory of guano, where loam makes a large proportion, and his son says the owners are coining money. He heard that the loam came from Croydon, by rail, but he says it arrives in covered waggons. *Eyebright, Covent Garden.*

Green Peas.—Your observations last week respecting early Peas having been in Covent-garden Market a fortnight earlier than those I sent you, rather damped my energy, because I thought the circumstance impossible. I immediately instituted enquiry, and could hear of but one small parcel, which came from Cornwall at the time you name, and they were "forced." I have taken the trouble to ascertain the fact by sending to Cornwall, and with this I send a letter in reply, received this morning from there, which I beg you to peruse, and having done so, trust you will do me the justice to state as much in your next Number, as you will admit that "fair play is a jewel," and should be extended to all amateurs, particularly if they are to persevere in their discoveries; otherwise there is but little encouragement for them. *John Roberts, Eastcheap.* [The following is the letter alluded to: "I have this day made enquiries respecting the Peas, and find that one lot was sent to London about a fortnight since grown in this neighbourhood, but forced. Out-door Peas are very late this season. *J. Prockter, Penzance, May* 22."]

The Awards of the Judges at the Chiswick Exhibition on the 18th inst.—I am sorry to feel myself called upon to make any complaint on this subject. I had always been led to suppose that it was intended to make the miscellaneous collections as varied as possible, by not allowing duplicates in them. If this is the object in view, then the judges committed a mistake in giving the 3d prize for 15 stove and greenhouse plants, which ought to have either been disqualified or placed 5th, for it contained a small collection of six Azaleas and three Heaths, and a plant of Adenandra that was a disgrace to the exhibition. I am aware that the Council does not interfere with the award of the judges, but I have thought it advisable to remind the latter that exhibitors do not like such blunders. The judging the 12 Azaleas was also in my opinion discreditable to respectable men. *W. Taylor, Gardener to J. Coster, Esq.*

Societies.

HORTICULTURAL: GARDEN EXHIBITION, *May* 18.—The leading features of this great exhibition being fully reported in another column, we will confine ourselves to describing the scene in detail.

In collections of 20 STOVE AND GREENHOUSE PLANTS, the large Gold Medal was awarded to Mr. May, gr. to Mrs. Lawrence, of Ealing-park, for a group containing many excellent examples of the best cultivation. At the back stood an immense Epacris grandiflora, whose equal it would be difficult to find, and supporting it huge plants of Polygala acuminata, Eriostemon buxifolium, Polygala Dalmaisiana, a handsome kind; Bossiæa disticha, Ixora coccinea, Eriostemon intermedium, the best of all the Eriostemons; Podolobium trilobatum, a Pimelea spectabilis, than which we have never seen a better, except perhaps one from the same establishment shown as a single specimen; a double red Azalea, Eriostemon neriifolium, Boronia serrulata and pinnata, the larger variety of the beautiful blue Leschenaultia, L. formosa, Chorozema varium nanum, C. Lawrenceanum, a graceful species; Gompholobium barbigerum, Hovea Celsi, and a large Pimelea diosmæfolia. Without being too diffuse, these plants were sufficiently so to render them graceful, and, with one or two exceptions, hardly a stick was to be seen.—Another group of 20 was contributed by Mr. Cole, gr. to H. Colyer, Esq., of Dartford. It comprised Stephanotus floribundus, the bright red Azalea called optima, the showy Adenandra, Erica Cavendishii, a well flowered Clerodendron splendens, the beautiful Hovea Celsi, Leschenaultia formosa, Chorozema Henchmanni, Boronia serrulata and pinnata, the Hoya-like Cyrtoceras reflexum, Chironia glutinosa, a beautiful Aphelexis purpurea macrantha, Chorozema varium nanum, the useful Franciscea acuminata, Ixora coccinea, Erica ventricosa coccinea minor, one of the most free flowering of Heaths; the Box-leaved Eriostemon, Pimelea spectabilis, and an Azalea, on which were "worked" lateritia, Gledstanesi, and variegata, the three varieties forming a nice bush of various coloured blossoms. Groups of 20 plants were also contributed by Messrs. Frazer and Pamplin. The former had Epacris grandiflora, Polygala acuminata, three red Azaleas, Pimelea spectabilis, the larger variety of Leschenaultia Baxteri, Boronia pinnata and serrulata, Chorozema varium and Henchmanni, Erica propendens and Cavendishii, Eriostemon buxifolium, Hypocalymna robustum, a plant not very often seen; Lachnæa purpurea, Leschenaultia formosa, Aphelexis speciosissima, and the Nerium-leaved Eriostemon.—Messrs. Pamplin sent Epacris grandiflora, a huge Genista racemosa, a large Erica vestita, a white Azalea, Pimelea spectabilis, linifolia, and lanata, Eriostemon buxifolium, Polygala oppositifolia, a nice Hovea Celsi, a neat Erica propendens, E. intermedia, and Dillwynia juniperina.

Collections of 15 STOVE AND GREENHOUSE PLANTS were numerous. The best was produced by Mr. Green, gr. to Sir E. Antrobus, Bart. It consisted of Polygala oppositifolia, the Box-leaved Eriostemon, a large and finely flowered double red Azalea, A. variegata, Boronia pinnata, Aphelexis humilis, the sweet smelling white-flowered Sphenotoma gracilis, the dark green leaved Spiræa-like Acrophyllum venosum, Chorozema varium nanum, Baxter's Leschenaultia and L. formosa, a well flowered Erica depressa, E. Cavendishii, Pimelea spectabilis, and a purple Everlasting.—A group little inferior to the above was produced by Mr. Carson, gr. to W. F. G. Farmer, Esq. It contained the gracefully drooping yellow and brown flowered Bossiæa linophylla, Azalea variegata, Franciscea macrophylla, a coarse species, but when well flowered as this was tolerably attractive; a large Pimelea spectabilis, a neat Ixora coccinea, Smith's red Azalea, at least 6 feet high and quite a pyramid of flowers; Oxylobium Pultenææ, a useful greenhouse plant; Leschenaultia formosa, Polygala oppositifolia, a rampant Epacris grandiflora, Adenandra speciosa, the Anemone-leaved Boronia, Sphenotoma gracilis, Burchellia capensis, and "last, but by no means least," a charmingly flowered specimen of Mr. Fortune's Gardenia, whose large waxy blossoms of snowy whiteness were the admiration of everybody.—The third group was furnished by Mr. Gerrie, gr. to Sir J. Catheart, Bart. It comprised large plants of Eriostemon buxifolium, Azalea variegata and lateritia, Pimelea spectabilis; a good plant, but with few blooms on it of Æschynanthus Boschianus; a white Azalea at least 6 feet in height; Zichya villosa, the brilliant Epacris miniata, Erica halicacaba, a curious green-flowered species; Adenandra uniflora, and one or two other plants.—A fourth group was produced by Mr. Taylor, gr. to J. Coster, Esq., of Streatham. We remarked in it Adenandra speciosa; Aotus gracillima, a profuse blooming brown and yellow flowered New Holland plant, of rather recent introduction; a pyramidal Eriostemon buxifolium, Polygala oppositifolia, the broad leaved Daviesia, Pimelea linifolia, a badly flowered Azalea, the buff-blossomed Heath called Alberti, the cheerful rosy-pink flowered Adenandra fragrans, an Everlasting, Epacris lævigata, a nice Ixora crocata, and Erica elegans.—Mr. Ivison, gr. to the Duchess Dowager of Northumberland, showed a fifth group of 15 plants, among which were a large Euphorbia splendens, Polygala oppositifolia, a fine specimen of Gardenia Stanleyana covered with flowers, which however were unfortunately much past their best; Zichya coccinea, a huge Nerium-leaved Eriostemon, Gompholobium polymorphum, Hardenbergia monophylla, a white Azalea, a small Vinca rosea, a nice Aphelexis sesamoides, Lyparea pinnatifida (one of the most useful greenhouse plants an amateur could possess, for it is nearly always in flower), the brilliant scarlet Siphocampylus microstoma ruber, the double flowered Tabernæmontana coronaria, Mr. Fortune's elegant Chinese Indigofera, and a small Azalea called fulgens.

Six collections of 10 STOVE AND GREENHOUSE PLANTS were exhibited. The first was produced by Mr. Malyon, gr. to T. Brandram, Esq., Blackheath. It contained Pimelea spectabilis, Aphelexis humilis, Crowea saligna (insufficiently in bloom), Chorozema Lawrenceanum, a double-red Azalea, some Heaths, and other plants. Second, Mr. Stuart, gr. to T. Huggins, Esq., of Norwood, large Cytisus canariensis, Boronia anemonæfolia, Zichya longipedunculata, a pretty species; Podolobium staurophyllum, a white Azalea, a tastefully-trained Tropæolum tricolorum, Erica intermedia and depressa, Eutaxia myrtifolia, and Leschenaultia formosa. Third, Mr. Speed, of Edmonton, Erica perspicua nana, the pretty Tremandra verticillata, Dillwynia pungens, Azalea variegata, Aphelexis speciosissima, Erica hybrida, Chorozema Lawrenceanum, Azalea phœnicea, Pimelea Hendersoni, and Vinca rosea. Fourth, Mr. Young, gr. to C. Baron, Esq., of Denmark-hill, Camberwell, an Everlasting, a purple Azalea, Chorozema varium, Genista rhodopnœa, Pimelea spectabilis, Epacris miniata, Eriostemon buxifolium, Erica Cavendishii, Chorozema Lawrenceanum, and Dillwynia ericoides. Fifth, Mr. Glendinning, of Turnham-green, Eriostemon myoporoides, Chorozema varium nanum, a nice Polygala oppositifolia, Dillwynia speciosa, Tremandra verticillata, Sphenotoma gracilis, Muraltia Heisteria, an Everlasting, the creamy yellow flowered Heath called fastigiata lutescens, and Pimelea Hendersoni. Sixth, Mr. Slowe, gr. to W. R. Baker, Esq., Gompholobium polymorphum, Epacris grandiflora, Pimelea spectabilis, the blue Leschenaultia, Adenandra speciosa, Polygala oppositifolia, and a small plant of the seldom seen Eriostemon scabrum.

Collections of 6 STOVE AND GREENHOUSE PLANTS were numerous. Mr. Kinghorn, gr. to the Earl of Kilmorey, sent well managed plants of Leschenaultia formosa, quite a little pyramid of flowers; Eriostemon buxifolium, the brilliant Azalea optima, Erica ampullacea,

Chorozema Henchmanni, and Tremandra verticillata. The next best six plants were Erica Cavendishii, Aphelexis purpurea, Ixora coccinea, Sphenotoma gracilis, Chorozema Lawrenceanum, and a Franciscea, from Mr. May, gr. to E. Goodhart, Esq.; and Mr. Stanly, gr. to H. Berens, Esq., sent Epacris grandiflora, Franciscea augusta, Daviesia latifolia, Aphelexis humilis, Pimelea spectabilis, and Erica Cavendishii.—Mr. Bruce, of Tooting, had Erica vestita, Leschenaultia formosa, Epacris miniata, an Everlasting, the showy Adenandra, and Chorozema varium.—Mr. O'Brien, gr. to G. Read, Esq., of Bridgewater, Somerset, produced Cyrtoceras reflexum, the new Pimelea Verschaffeltii, Erica Sprengelii, an Everlasting, and a Boronia.

Orchids.—Fine as we have seen Mr. Rucker's productions in former years, they were completely eclipsed by the 20 plants exhibited by Mr. Mylam on Saturday last. Some of the Saccolabes more especially were magnificent—"perfect fountains of flowers." The collection consisted of Phalænopsis amabilis bearing a glorious spike of white blossoms, a capital Saccolabium guttatum, S. præmorsum with racemes at least 15 inches in length, the beautiful Dendrobium densiflorum, Low's Cœlogyne (C. Lowei), the scarce Huntleya meleagris, the rare Cymbidium eburneum, Lycaste tyrianthina with 11 flowers, Vanda tricolor with four spikes, V. cristata and suavis, the large flowered Phalænopsis, Chysis bractescens, Aerides affine, Dendrobium formosum with 16 flowers; a charming D. Devonianum, the handsomest of Dendrobes; a tall Vanda teres, the Aloe-leaved Epidendrum, Cattleya intermedia, and Cyrtochilum stellatum. The next group in point of merit was produced by Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon; it contained Dendrobium macrophyllum, D. cærulescens, nobile, Jenkinsii, and fimbriata, Cattleya Skinneri, the best varieties of C. Mossiæ and C. intermedia; also Lælia majalis, a species seldom seen in flower; the beautiful L. cinnabarina, Lycaste cruenta, the orange-blossomed Epidendrum and E. macrochilum, Maxillaria tenuifolia, the Japan Calanthe bicolor, the larger variety of Brassia maculata, Odontoglossum pulchellum, and the large-flowered Phalænopsis.—A third group was produced by Mr. Rae, gr. to J. J. Blandy, Esq., of Reading. In this we remarked the orange-blossomed Epidendrum vitellinum, Aerides virens and crispum, Phalænopsis grandiflora, a highly coloured Cattleya Skinneri, Chysis bractescens, a variety of C. Mossiæ, the singular looking Scuticaria Steeli, with two fine flowers on it; Vanda Roxburghi, Dendrobium nobile, Oncidium guttatum, Calanthe veratrifolia, a fine plant of the pale yellow and brown flowered Epidendrum Stamfordianum, Dendrobium densiflorum, and Phalænopsis amabilis.—Mr. Franklin, gr. to Mrs. Lawrence, of Ealing Park, sent Aerides crispum, Dendrobium formosum, Saccolabium guttatum, the scarce Dendrobium Dalhousieanum, Cyrtopodium punctatum, Phalænopsis amabilis, two varieties of Cattleya Mossiæ, C. intermedia, Vanda teres and V. insignis, the charming Dendrobium densiflorum, D. nobile, Chysis bractescens, Calanthe veratrifolia, Lycaste cruenta, and Oncidium divaricatum.

Orchids in collections of 15 were shown by Messrs. Veitch, Rollisson, and Mr. Dobson, gr. to Mr. Beck. Messrs. Veitch had the curious rather than handsome Grammatophyllum multiflorum, Oncidium divaricatum and sphacelatum, Aerides crispum, Cypripedium barbatum, Camarotis purpurea, a large Dendrobium nobile, the larger variety of Oncidium ampliatum, the white-lipped Oncidium (O. leucochilum), a beautiful Calanthe veratrifolia, with nine spikes of chaste white flowers; Dendrobium moniliforme and the charming D. Devonianum, a good Cattleya Mossiæ, an Aerides, and a pretty Vanda suavis.—In Messrs. Rollisson's group we remarked Lycaste cruenta, Saccolabium præmorsum and S. guttatum, the rare Cypripedium Lowei, Acineta Barkeri, Epidendrum Stamfordianum, Calanthe veratrifolia, Dendrobium moschatum, Aerides crispum and affine, Oncidium divaricatum, and the pretty Leptotes bicolor.—Mr. Dobson had Phalænopsis amabilis, the rare Burlingtonia rigida, Epidendrum vitellinum, crassifolium, and selligerum; Dendrobium aggregatum, densiflorum, and nobile, all fine specimens; Saccolabium guttatum, Cattleya Skinneri, the larger variety of Oncidium ampliatum, and O. stramineum.

Ten Orchids were contributed by Mr. Carson, gr. to W. F. G. Farmer, Esq., and Mr. Blake, gr. to J. H. Schröder, Esq. In the former group were Lacæna bicolor, with a long spike of greenish-yellow flowers, Cyrtochilum stellatum, the large blossomed Phalænopsis, Acanthophippium bicolor, carpeting the surface of the pot with flowers, Mr. Skinner's Cattleya, Saccolabium guttatum, and a large and capitally flowered specimen of the minutely spotted Acineta Humboldtii in a square wire basket: this had nearly a dozen flower spikes on it.—Among Mr. Schröder's plants were Dendrobium pulchellum, Oncidium Papilio, Aerides virens, Lycaste cruenta, the rare Anguloa Clowesii, Calanthe veratrifolia, a fine specimen; Saccolabium guttatum, Cattleya intermedia, and Brassia verrucosa.

The best collection of six Orchids was shown by Mr. Kinghorn, gr. to the Earl Kilmorey. It consisted of Phaius grandifolius, Phalænopsis amabilis, Oncidium ampliatum majus, O. altissimum, Dendrobium cærulescens, and Calanthe veratrifolia.—Mr. Ivison had Dendrobium densiflorum, the larger variety of Oncidium ampliatum, O. altissimum, Dendrobium Wallichii, Epidendrum microphyllum, and Vanda tricolor.—Mr. Green sent a fine Dendrobium nobile, and in the collections of six plants from Mr. O'Brien and Mr. Gerrie, we observed Dendrobium Devonianum, Sobralia violacea, Stanhopea tigrina, and a good plant of the spotted Brassia.—Mr. Cole showed a large Dendrobium Calceolaria, as a single specimen.

Azaleas were numerous, large, and fine, and they made, as they always do at the May show, a striking display. Two excellent collections of 12 plants were produced—one from Mrs. Lawrence, of Ealing-park; the other from Mr. Green, gr. to Sir E. Antrobus, Bart. It is difficult to say which of these groups was the best; Mr. Green's plants were better flowered than those of Mrs. Lawrence; but they were all, or nearly all, trained "to a face," while those from Ealing-park were alike bushy on all sides. They consisted of coronata, optima, præstantissima, Gledstanesi, double red, Chinese yellow (the two latter possibly the worst in the group), variegata, Lawrenceana, lateritia, exquisita, magniflora, and Rawsonii. Mr. Green had a fine plant of exquisita, indica alba, triumphans, lateritia, Chinese yellow (a nice specimen), præstantissima, variegata, Gledstanesi, optima, and rosea punctata.—Mr. Lane, of Great Berkhampstead, sent indica alba, double purple, magniflora, optima, Leucomegista, mirabilis, double red, Broughtonii, grandis, triumphans, picturata, and punctata.—Groups of six plants were furnished by Messrs. Frazer, Carson, and Bruce. Among these we remarked optima, variegata, sinensis, Smithii coccinea, exquisita, lateritia, Gledstanesi, præstantissima, speciosissima, and splendens.

A collection of tall Cacti was exhibited by Mr. Green. It contained Epiphyllum Jenkinsoni, E. Russellianum, E. Ackermanni grandiflorum, E. speciosum majus, larger and much handsomer than the old speciosum; E. coccineum grandiflorum, and Cereus speciosissimus. A white variety, very like Cereus crenatus, was shown by Mr. Gandy.

Rhododendrons.—Mr. Gaines and Mr. Ivison had collections. Among the varieties were aureum, Caractacus, Venus, Symmetry, Empress, &c.—Mr. Edmonds, gr. to the Duke of Devonshire at Chiswick, sent a tall specimen of R. formosum, covered with large white flowers stained in the upper petals with yellow, and deliciously scented.—Messrs. Veitch produced the new Jasmine-flowered kind, mentioned below, and Mr. Mountjoy, of Ealing, received a Certificate of Merit for a seedling called campanulatum punctatum.

The Roses in pots equalled any exhibition of the kind we have hitherto seen. Mr. Lane's 12 plants were magnificent. The productions of Messrs. Paul and Francis, with the exception perhaps of Madame de St. Joseph, the beauty of which was over, were also shown in excellent condition, and the plants from Messrs. Terry, Roser, and Rowland likewise did them much credit. The sorts were nearly the same as those shown at Regent's-park on the 8th inst., and fully reported at p. 294.

Cape Heaths were numerous, and generally finely flowered. Excellent plants were furnished by Mr. Rucker, Mr. Quilter, Mr. Colyer, and Mr. Green; and in the Nurserymen's Class, Messrs. Fairbairn, Veitch, and Rollisson sent capital examples of good Heath growing. The plants in 11-inch pots, by the same growers, were also beyond all praise. In the different collections we remarked the following varieties: propendens, elegans, stricta, a nice kind; denticulata moschata, suaveolens, ventricosa coccinea minor, dilecta, the larger variety of aristata, Hartnelli, metulæflora, favoides purpurea, Sindriana, vestita coccinea, v. rosea, mutabilis, nitida, tricolor Wilsoni, Cavendishii, depressa, splendens, odore rosæ, Primuloides, ampullacea "carminbrata," Sprengeli, Macnabiana and its rose-coloured variety, vasæflora, nigrita, campanulata, tortulæflora, Beaumontia, florida, Bergiana, Victoria Regina, a new and good Heath; mundula, Jasminoides, and Peziza, a pretty white variety.

Single Specimens.—The best was an enormous Pimelea spectabilis, in the very best condition, from Mr. May, gr. to Mrs. Lawrence; a large and well flowered Hoya imperialis, from Mr. Glendinning; the Rhododendron formosum, already alluded to, from Mr. Edmonds; a good Erica Cavendishii, from Mr. Kinghorn; E. vasæflora, from Mr. Rucker; Mitraria coccinea, from Messrs. Veitch; and Zichya longipedunculata, from Mr. Ayres.

New Plants consisted of a flower and two leaves (one inverted, so as to show the under surface) of Victoria Regia from Mr. Paxton, gr. to the Duke of Devonshire, at Chatsworth, together with a landscape, representing the manner of growth of the plant in its native waters; a flower and leaf of the same queen of aquatics from Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon; Viburnum plicatum covered with large balls of white flowers, from Messrs. Standish and Noble; a jasmine-flowered Rhododendron, Stylidium ciliare, Bolbophyllum Lobbii, an Anguloa, and a Cœlogyne, Dendrobium transparens, Medinilla bracteata, Pimelea Neippergiana, and a Lycopod, from Messrs. Veitch; a promising species of Hovea, and Pimelea Verschaffeltii, from Mr. Stanly; P. Neippergiana and Bossiæa Hendersoni, from Mr. Taylor, gr. to J. Coster, Esq.; Dendrobium Farmeri, from Mr. Williams; an Anguloa from Mr. Schröder; a large variety of the box-leaved Eriostemon from Messrs. Rollisson; Hæmanthus multiflorus (!) from Messrs. Garraway and Co., of Bristol; Acacia grandis, Pimelea Neippergiana, and P. Verschaffeltii, from Messrs. Henderson, Pine-apple-place.

Pelargoniums, with a few exceptions, were nicely bloomed, and made a fine display. For new varieties in 8-inch pots, 1st, Mr. Cock, Chiswick, pictum, Salamander, Centurion, Rosamond, Mont Blanc, and Mars; 2d, Mr. Robinson, gr. to J. Simpson, Esq., Forget-me-Not, Gulielma, Orion, Armada, Negress, and Pearl; 3d, Mr. Stains, Middlesex-place, New-road, Alonza, Pearl, Negress, Lalla Rookh, Forget-me-Not, and Gulielma. Nurserymen: 1st, Mr. Dobson, gr. to Mr. Beck, Cuyp, Mont Blanc, Rosamond, Gulielma, and Emily; 2d, Mr. Gaines, Rosamond, Aspasia, Mrs. Beck, Juliana, Armada, and Duke of Northumberland. Old kinds in 11-inch pots, 1st, Mr. Cock, Rosamond, Salamanda, Bertha, Forget-me-Not, Pearl, and Orion; 2d, Mr. Parker, Roehampton, Orion, Zanzummim, Forget-me-Not, Pearl, Negress, and Rosy Circle. Nurserymen: In this class Mr. Gaines was the only competitor. His plants were insufficiently in bloom.

Fancy Pelargoniums.—1st, Mr. Robinson, Anais, Queen Superb, Statuiski, Jenny Lind, Fairy Queen, and Empress; 2d, Mr. Stains, Yeatmanianum grandiflorum, Nymph, La Belle Africana, Madame Miellez, Statuiski, and Queen; 3d, Mr. Gaines, Madame Miellez, Elegans, Jenny Lind, Anais, Madame Rosati, Odorata, and Magnifica.—Mr. Ambrose had Statuiski, Anais, Lady Rivers, Ibrahim Pacha, Duchess d'Aumale, and Picturata.—Mr. Moseley also had six varieties, but they were not different from the above.

Cape Pelargoniums were shown by Messrs. Parker, Stains, and Mylam. The kinds were nearly the same as those mentioned in our report of the Botanic Society's meeting, at page 294.

Seedling Pelargoniums.—Mr. Beck had Rosa and Incomparable, two varieties of great colour; also "Little but good," Diana, Major Domo, and others.—Mr. Hoyle sent a neat and striking sort called Ocellatum, with pale rosy-pink flowers, having a deep crimson spot on all the five petals. The same raiser had also some other seedlings.—Mr. Rendle had Beauty of Montpellier, large rose with a crimson spot in the top petal, and a white throat.

Calceolarias.—Collections were exhibited by Mr. Gaines and Mr. Stanly; in these we remarked Regulator, Baron Eden, Maid of Orleans, Nil Desperandum, Solicitor-General, Beauty, Medona, Enchantress, and Don Sebastian.—Mr. Kinghorn had three pretty seedlings, named Mary, Cleopatra, and Portia.—Mr. Gaines sent Magnifica, a finely shaped flower; also Arbela, Maid of Orleans, Canariensis, and Mielia, all good flowers both in shape and marking.

Cinerarias.—Six varieties in 8-inch pots. 1st, Mr. Henderson (Wellington-road), Attila, Wellington, Cerito, Camilla, Angelique, and Alboni; 2d, Mr. Lane; and 3d, Mr. Gaines.—Messrs. Henderson, of Pine-apple-place, had also some good plants of the best kinds.—Seedlings were numerous, and some of them good and distinct. Among the best were Madame Sontag (Mr. E. G. Henderson), Queen of England (Salter), Lady Hume Campbell (Mr. E. G. Henderson), Prima Donna (ditto), Mrs. Charles Kean (ditto), and Renville (Messrs. Henderson, Pine-apple-place).

Fuchsias.—Some nice seedlings were produced by Mr. Kendall, more especially a light kind called Dr. Gross.

Amaryllids.—Messrs. Garraway and Co., of Bristol, sent a small group, consisting of amœna, marginata odorata, marginata venusta, and a very fine large velvety, deep crimson sort, called "Ackermanni pulcherrima." (?)

Helichrysums.—Collections were shown by Mr. Cole and Mr. Green. The sorts were Aphelexis argentea, grandiflora, macrantha purpurea, sesamoides, &c.

Alpine Plants.—Two interesting collections were produced; one by Mr. Wood, of Norwood, the other by Mr. Turner, of Holloway. Mr. Wood's plants were Phlox nivalis, P. subulata, Sedum ternatum, Antennaria dioica, Cheiranthus ochroleucus, Veronica prostrata, Saxifraga tricuspidata, Alyssum alpinum, Ajuga genevensis, Linaria hepaticæfolia, Houstonia cærulea, and Stachys corsica.

Variegated Plants.—Mr. Wood showed the following varieties:—Bellis perennis, Euphorbia Characias, Arabis ciliata, Salvia officinalis, Funkia undulata, Euonymus japonicus, Glechoma hederacea, Alyssum saxatile and maritimum, Thymus serpyllum, Taxus baccata, Spartium scoparium, Melissa officinalis, Fragaria elatior, Rubus fruticosus, Iris Pseud-Acorus, Acorus gramineus, Sambucus niger, and Hedera Helix.

Fruit was scarce—a circumstance to be attributed to the long cold spring which we have experienced. Mr. Jones, gr. to Sir J. Guest, Bart, sent three nicely ripened Ripley Queen Pine-apples, whose weights were respectively 4½ lbs., 3 lbs. 8½ oz., and 3 lbs. 2½ oz. Mr. Davis, of Oak-hill, East Barnet, had a Queen weighing 2 lbs. 10 oz.; the same grower also sent a Blood Pine-apple weighing 3 lbs. 7 oz, and a black Jamaica 2lbs. 11 oz. Mr. Davis, gr. to Lord Boston, exhibited two Providences, one 8 lbs. 5 oz., and the other 8 lbs. 4 oz. Mr. Slowe, gr. to W. R. Baker, Esq., had an over-ripe Providence weighing 7½ lbs., and another over-ripe fruit of the same variety of Pine-apple, weighing 7 lbs. 2 oz., was shown by Mr. Davis, of Oak-hill. Black Hamburgh Grapes, well swelled and coloured, were contributed by Mr. Ingram, gr. to her Majesty at Frogmore, Mr. Turnbull, gr. to the Duke of Marlborough at Blenheim, Mr. Fleming, gr. to the Duke of Sutherland at Trentham, Mr. Elphinstone, gr. to the Right Hon. the Speaker; Mr. Davis, of Oak-hill; Mr. Mitchell, of Brighton; and Mr. Toy, Oatlands Palace-gardens, Weybridge. White Grapes generally were insufficiently ripened. Mr. Spencer, however, gr. to the Marquis of Lansdowne, had a dish of Cannon-hall Muscats, which were quite ripe, exhibiting the pale

yellow colour peculiar to this variety in that condition. These received a Large Silver Medal. Mr. Jackson, gr. to H. Beaufoy, Esq., showed good bunches of Sweetwater, and so did Mr. M'Walter, gr. to Col. Challoner, and Mr. Elphinstone. Bunches of the same kind of Grape were also produced by Mr. Davis, of Oak-hill. Mr. Toy had good Black Frontignans and Muscadines, and the latter were also shown by Mr. Ricardo's gardener. Mr. Fleming sent a specimen bunch of Black Hamburgh, weighing 1 lb. 7½ oz., and Mr. Davis, of Oak-hill, another weighing 2 lbs. 3 oz. A dish of large and highly coloured Royal George Peaches, and another of Murray Nectarines were contributed by Mr. Fleming. Mayduke Cherries were shown by Mr. Ingram and Mr. Fleming, and the latter received a Silver Knightian Medal for the heaviest Melon, and a similar award for the best-flavoured ditto, the sort in both cases being the Hybrid Green-fleshed Persian. Mr. Monro, gr. to Mrs. Oddie, produced a well-fruited Seville Orange tree in a pot. By far the best Keens' Seedling Strawberries exhibited were furnished by Mr. Elphinstone, gr. to the Right Hon. the Speaker; these were in every respect excellent. Mr. Toy and Mr. Meredith, gr. to the Duke of Sutherland at Cliefden also sent good examples of the same variety, and so did Mr. Patterson and Mr. Monro. British Queens were produced by Mr. Toy; and Mr. Slowe furnished well-fruited plants in pots of the same sort of Strawberry. Mr. Snow, gr. to the Earl de Grey, furnished dishes of Apples and Pears of last year's growth, in good condition; they consisted of Sturmer Pippin, Golden Reinette, Winter Queen, Ribston Pippin, Old Green Nonpareil, Court of Wick, Boston Russet, and a fine-looking unnamed red Apple. The Pears were Uvedale's St. Germain and Winter Warden.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Orchids now require the most liberal treatment to induce them to fully develope their interesting characters. A good and healthy growth will be ensured by a warm humid atmosphere, with fresh air so admitted as to avoid draughts, and by shading with thin canvas during the brightest part of the day. In the afternoon the plants should be gently dewed over, using a syringe with a fine rose for the purpose; we have often seen such work done with a coarse syringe, and the water driven through it with all the force possible, but such a practice is very injurious to the plants. Some of the stove plants which commenced their growth earliest in the season, will now be about completing it; and that it may be properly matured, they will require to be exposed to stronger light, and a freer admission of air, than has been afforded them during their season of growth. These hints, at this time, will particularly apply to those winter-flowering plants, which produce their blossoms upon the young shoots of the previous year's growth. Among these we may mention the delightfully fragrant and abundant blooming Francisceas, and the several stove species of Jasminum, especially the one known as J. multiflorum, or J. hirsutum, than which a more charming winter plant does not exist, if it be grown very strong during the summer, and well ripened. We, last winter, had wreaths of its fragrant blossoms two to three feet in length; but if plants of this description are kept too long in a hot damp atmosphere, they will continue to grow without making preparations for flowering. The number of plants ready to commence the ripening process is not great at present, but it is increasing every week, and those which are not yet ready must be carefully watched, to ascertain when the proper time arrives for each. The practised eye will readily detect the proper period at which to commence the gradual admission of a greater quantity of air, and the freer exposure to the sun; but to the tyro this is not so easy a matter: he must, however, watch attentively the natural indications given by the plants, and the moment he observes the young shoots show an inclination to terminate their growth, he may conclude that the proper time is come for ripening them. In plants which flower immediately after they have completed their growth, this will evince the necessity of less excitement; and that the blossoms may be strong and abundant, the plants may no longer be confined in a hot moist atmosphere, but in all cases let it be observed that the transition be gradual. Other plants which do not at present exhibit any desire to pause in their growth, should be encouraged with an adequate supply of heat and moisture, and by shading from the scorching rays of the sun.

FORCING DEPARTMENT.

Where Pines are grown on the planting out system, it should be remembered that the soil ought to be entirely renovated once in three or four years; the time for this operation must be left to the judgment and convenience of the cultivator; but if all, or nearly all of the older plants in any pit have perfected their fruit, such is an excellent opportunity for the purpose, and this is a very favourable time of year for the operation. The younger plants (which have been put in, one after another, as vacancies occurred), after being well watered, may be carefully lifted with balls, and set in a close shed, while the soil is being changed. But if any remain of those which have already shown fruit, they may be left standing, with a small mound of earth about their roots. Or if they are not very far advanced, they may, for appearance sake, be removed with balls to the back row; as they do not suffer if it be carefully done. The soil should consist of about one-third of the best peat that can be obtained, and two-thirds of rich turfy loam, with an admixture of sand, according to the requirements of the other materials. The plants of the back row should be planted before the soil is put in for the second one; and the remaining rows proceeded with in the same order, that none of the soil be needlessly compressed. If the new soil is moderately moist, it will be better to withhold water from the roots for a few days, to allow the plants to make an effort of their own; and until they are thoroughly re-established a moister atmosphere must be kept up, and the pits shaded rather more than usual. Vineries.—A liberal supply of air in these houses is the best preventive against scorching. In finally regulating the Grapes of the latest crops, which are intended to hang through the winter, rather more should be cut away than from those intended for earlier use, that the bunch when ripe may hang looser. This will detract a little from their appearance, but the free circulation of air amongst the berries will do much to preserve them from the effects of damp weather.

FLOWER GARDEN AND SHRUBBERIES.

Attention should now be paid to the reserve stock, intended to supply the gaps which will occur, and especially in some of the beds which are filled at first with transient annuals, and which in the course of the season will require entirely renewing. To meet these demands, we prepare a bed of coal ashes rolled solid, and lay upon it 2 or 3 inches of soil composed of chopped turves, leaves, and coarse sand; in this we prick out young plants of such kinds as are likely to be required, at distances of from 4 to 6 inches asunder. In the preparation of plants for flower garden masses, we have tried various methods of economising labour and materials, and, for several years, have adopted this as the best. By it, the plants become established much sooner, and the cost of many thousands of small pots is annually saved. As the planting out will now be nearly finished, let all the beds be gone over, picking out weeds, pegging down, or tying up such as would blow about with the wind, and giving them every possible assistance, to enable them speedily to fill the beds. Herbaceous plants of all kinds are now growing rapidly, and many of them, unless immediately supplied with stakes, will have grown out of all shape, or the wind will blow them about and break them. Make everything in this department clean and tidy; and keep the turf and walks in the neatest order. Spare hand lights and frames may be placed in shady situations, and made use of for propagating double Wallflowers, choice Dianthuses, Phloxes, Iberis sempervirens, and many other select herbaceous and half shrubby plants.

FLORISTS' FLOWERS.

Ranunculuses.—Occasionally water in the evening between the rows; when requisite, do it effectually. This is far better than the little-and-often system. Destroy the Ciceda spumaria (Cuckoo-spit) which is apt to infest the plant. We do not recommend the surface soil to be removed, for Ranunculuses love a close and moist soil. Screen seedlings from excessive sun, and keep them slightly moist. Place the irons, or other support, ready to receive the awning as soon as the flowers require shade. Tulips will now be in their best around the metropolis; in the northern counties, a week later. The shows in the north which have already taken place, at Nottingham and Derby for instance, were miserable failures as far as Tulips were concerned. Protection from sun, rain, and wind is now only requisite. Carnations and Picotees. — Water and keep clean; tie the advancing spindles, and take care that the aphis or green fly gets no head. Polyanthuses and Auriculas should be now more attended to than ever; the former do not like excessive sun. If exposed to drought the red spider soon attacks them, and the consequences are serious.

HARDY FRUIT GARDEN.

The summer pruning and thinning of all fruit-bearing bushes is a vast improvement upon the common practice of allowing them to grow wild until winter. The superiority of the fruit, when this practice is adopted, is very encouraging, and an additional advantage consists in the work being done in half the time that it would require in winter. Tie in or nail the leading shoots of Pear trees, as they require it, but do not, even for the sake of neatness, stop all the shoots, lest by so doing the natural fruit-spurs for next season are forced into wood spurs; the former are readily known by their short thick stunted appearance, and instead of producing a shoot only produce a bunch of from four to seven leaves. Young trees which are being trained into pyramids or other shapes, should be examined once a fortnight, and the shoots which are not wanted pinched in with the thumb and finger, by which the growth of others may be encouraged. This process should commence with the upper shoots, that the sap may be directed into the lower branches; and after an adequate quantity of shoots of sufficient strength is secured to form the lower part of the tree, the leading shoots may be allowed to grow and furnish wood for the top of the tree. Stopping for wood is very different from stopping for the purpose of forming fruit buds; for the latter purpose it will be time enough to shorten the shoots a month hence. Gooseberries and Currants should have their young wood thinned out by immediately stopping at least half the number of shoots to four joints, to allow the air to circulate more freely in the centre of the bushes, and the remainder of the shoots should be stopped during the summer, according as the shape of the bushes requires it. This practice will almost entirely do away with winter pruning, while the flavour and size of the fruit will be greatly improved.

KITCHEN GARDEN.

Hand-lights should now be placed about a yard and a half asunder, upon the trenches which were prepared for ridge Cucumbers and Vegetable Marrows, and the plants carefully turned out the first dull day. It will be necessary that their watering be regularly attended to, and every fine evening they should be sprinkled over the foliage with a rose pot, till they are so far hardened as to admit of the foliage being removed. A few Vegetable Marrows, or ornamental Gourds may, with the strictest propriety, be planted against any spaces on the fruit walls which are unoccupied from bottom to top, owing to the small size of the fruit trees. The stations should be prepared for them by making large holes, and placing therein a couple of barrowsful of decomposed animal or vegetable manure, merely covering this with sufficient of the original soil to receive the plant.

State of the Weather near London, for the week ending May 23, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Cockroaches: *Emily.* Sink in the floors of the room a common basin partly filled with beer. They will tumble in in hundreds. After persevering nightly for a few weeks you will reduce the number to nothing; provided you kill with boiling water all that you catch. This should be done every morning.

Emigration: *A Young Gardener seeking advice* should apply to the Government Commissioners. We cannot undertake the duty of shipping agents.

Fruit Protectors: *A H.* These resemble bell-glasses, and are attached to walls by a little wire or other contrivance. They are described in our report of the proceedings at a meeting of the Horticultural Society, at p. 214 of the present volume.

Grapes: *Mediensis* observes that much difference of opinion exists with regard to the distinctions between varieties of Grapes denominated Muscats, Muscadels, Muscatels, Muscadines, and Musqué. In this country a Muscat Grape is generally understood to be the White Muscat of Alexandria; but in other countries the terms of Muscat, Muscadel, Muscatel, Moscatello, Moscado, and Muscateller, are applied to those kind of round-berried, black, white, or grizzly-coloured Grapes which we call Frontignans, and to these the Chasselas Musqué is allied. All those above mentioned have decidedly a Muscat flavour; but they form two very distinct classes, namely, those with *oval* or *obovate* berries, as the white and the black Muscats of Alexandria; and those with *round* berries, as the black, white, and grizzly Frontignans and Chasselas Musqué. The Muscadines are typified by the Royal Muscadine, alias Chasselas de Fontainebleau, and with it the Sweetwater, alias Chasselas Précoce, may be classed. ‖—*W C E.* The berries are rusty; but we are unable to say what is the matter with the leaves.‡

Insects: *W P.* We know of no other way of destroying "the swarms of insects in your leaf heap" except soaking it with boiling water.‡

Names of Plants: *M—l.* Lælia grandis.—*Hort.* Scorpion Senna.—*Z.* It is a fine white variety of the Wild Hyacinth. Lettuces, if of good sorts, will not run to seed if kept cool, and in damp ground. We fear that Calandrinia umbellata will not stand the winter. Œthionema membranaceum is a pretty and dwarf perennial. Pray do not apologise.—We hardly know whether it will be possible to find time to name some of the heaps of plants with which we are inundated by correspondents. There should be some consideration for the busy shown by the idle.

Paxton's Cottagers' Calendar may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

Peach and Nectarine Trees: *A T C C.* The reddish, swollen appearance of the leaves is the effect of cold; those affected in this way may be gradually picked off when, in consequence of warmer weather, an abundance of fresh leaves are produced. No bad consequences will result from this affection. But a worse enemy is at work, the red spider, and you must destroy it, or it will ruin your trees. See that the roots have sufficient moisture, and clean the foliage by frequently syringing it above and below. ‖

Stanwick Nectarine: *A B.* See p. 275. It has hitherto been only worked on the Peach stock.‡

Strawberries: *R C.* Cut off the runners if you do not want them. It is much better to dispense with their presence, if you can, until after the fruit is over.

Vineries: *Dollycoss.* Figs will answer your purpose better than anything else; but even they must have light.

Wiring Walls: *E S.* Read Mr. Fleming's article on the subject at p. 435 of our last year's volume.‡

Misc: *J K J.* The best things to be had from Beyrout are the bulbous plants of the country. You will obtain nothing else worth growing. All the Pines and other trees are perfectly well known and common. The fruits of the country are either here already, or not worth bringing home.—*A Lover of Gardening,* Datura Metel is a tender annual; the two others are stove climbers.

SEEDLING FLOWERS.

Pansies: *R T P.* In their present state your flowers are no improvement on varieties already in cultivation.‡

HOME GROWN SEEDS, CARRIAGE FREE BY GREAT WESTERN, SOUTH WESTERN, OR SOUTH EASTERN RAILWAYS.

	per lb.	per gal.
THE ASHCROFT SWEDE TURNIP.—This is decidedly the best of all Swedes; it is very large and better shaped than the Liverpool Swede, which it somewhat resembles; it is perfectly hardy, and being of quick and strong growth it is so soon in rough leaf as to be much less subject to suffer from attacks of the fly. The colour is yellow, with purple top	1s 0d	6s 0d
EARLY SIX WEEKS TURNIP.—An excellent sort for early sowing to feed off for Wheat. *A Field of these Turnips grown (from Messrs. Sutton's Seed) by Mr. E. W. Moore, at Coleshill, gained the 20l. prize at the Farringdon Agricultural Show in December last*	1 0	6 0
SUTTON'S PURPLE-TOP YELLOW HYBRID.—*This sort is equal to a fine yellow Swede, may be sown much later, and keeps well till spring*	1 0	6 0
DALE'S HYBRID.—A fine green-top Turnip ...	0 10	4 6
YELLOW TANKARD.—Very excellent ...	0 11	5 0
LINCOLNSHIRE RED.—*The original stock of this superior New Turnip was presented to J. S. and Sons by Philip Pusey, Esq., M.P.*	1 0	6 0

Liverpool Swedes, Laing's, Matson's, Fettercairn, and other Swedes. Fine Green-round, Globe, Tankards, and other Turnips, true stocks of home growth, 20s. to 30s. per bushel (as see Sutton's Agricultural Seed Catalogue). True Italian Rye Grass, 6s. 6d. per bushel. Fresh imported Lucerne, 80s. per cwt. White Mustard Seed, 10s. per bushel. French Furze, 1s. per lb., and all other Agricultural Seeds at lowest market prices.

JOHN SUTTON and SONS, Nos. 7 and 8, Market-place, Reading, Berks, confidently recommend the above articles as being of very superior quality; *they beg also to refer to their Advertisement which appeared on the last page of the Gardeners' Chronicle on the 30th of March*, by which it will be seen that they supply GRASS SEEDS FOR PERMANENT PASTURE, either separate or mixed, AT MUCH LOWER PRICES than those usually charged. *Carriage free, as see above.*

RENDLE'S DESCRIPTIVE CATALOGUE OF AGRICULTURAL SEEDS IS JUST PUBLISHED, and can be had on application, GRATIS (for one penny stamp).

It contains a descriptive list of all the best Field TURNIPS, *with the lowest market prices, also a full descriptive price current of all the best sorts of* CARROTS, MANGOLD WURZEL, CLOVER, *&c., as well as all the best varieties of Permanent Pasture Grasses.*

The following is an extract from the Catalogue.

Rendle's Imperial Purple-top Swede Turnip ...	per lb.	0s. 8d.
Ditto ditto	per qt.	1 0
Skirving's Liverpool Swede ditto, per lb., 8d.	per qt.	1 0
Laing's Improved ditto ditto, per lb., 8d.	per qt.	1 0
Purple-top Scotch ditto ditto, per lb., 8d.	per qt.	1 0
White and Green Globe per lb., 6d.	per qt.	0 10
White Belgian Carrot	per lb.	0 10
Yellow Globe Mangold Wurzel	per lb.	0 8
True Italian Rye-grass	per bush.	7 0
Best English Red and White Clover	per lb., 5d. to	0 7
Large Cattle Parsnip	per lb., 1s. to	1 6

With every other kind of Agricultural Seeds at the lowest market prices. (See Catalogue.)

PERMANENT PASTURE GRASSES, sold in mixtures to suit various soils, at 30s. per acre, allowing two bushels of light seed and 12 lbs. of heavy seed to each acre.

All orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Gloucester, Bristol and Exeter, or South Devon Railways; or to any town in Devon and Cornwall; or to Cork, Dublin, or Liverpool, by Steamers.

Railway and Steam communication to all parts of Great Britain and Ireland.

For Catalogues and further particulars apply to
WILLIAM E. RENDLE & CO., Union-road, Plymouth.
ESTABLISHED 1786.

FIELD TURNIP SEEDS, &c.

HOGG AND WOOD, SEEDSMEN BY APPOINTMENT TO THE NORTHUMBERLAND AGRICULTURAL SOCIETY, beg leave to draw the attention of Agriculturists to their select stock of TURNIP SEEDS, MANGOLD WURZEL, &c., all of which have been selected from the best stocks grown in Northumberland and the neighbouring counties of East Lothian, Berwickshire, &c., so deservedly renowned for their superiority in Turnip culture. Priced Lists may be had on application.

SWEDES.	YELLOWS.
Laing's new Purple-top, from Mr. A. Laing's stock.	Aberdeen Yellow.
Hogg's Dwarf-topped Purple-top.	Border Imperial Brown-top Yellow.
East Lothian Purple-top.	Dale's Hybrid.
Skirving's ditto.	Skirving's Purple-top Yellow.
Fettercairn Green-top, &c.	Besides all the varieties of common Turnips.

Delivered free in London, Hull, and Newcastle-upon-Tyne. A reference or remittance required from unknown correspondents.—Coldstream, N. B., Berwickshire.

TURNIP SEEDS.

DUNCAN HAIRS having personally superintended the selection and growth of the Turnip Seed he offers, can with confidence recommend them as genuine. Likewise, AGRICULTURAL SEEDS of every description, of first-rate quality and low in price. Catalogues with prices free.

Garden Tools, Nets, and every article connected with the trade wholesale and retail.

Seedsman and Florist, 109, St. Martin's-lane, Charing-cross.

LOOK TO YOUR STABLE EXPENDITURE, and attend to its economy and Corn-dealers' Bills.

CHAFF MACHINES.—Horse Masters should give cut Hay or Wheat Straw with the Oats they allow, and those Oats should be bruised.—MARY WEDLAKE'S superior CHAFF MACHINES and OAT BRUISERS, manufactured on the premises (40 years established), 118, Fenchurch-street, and 8, Billiter-street.

N.B. Chaff-cutting and Oat-bruising Machinery by horse-power. Old Machines repaired.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY!! and make the Animal look better than he now does when you are paying not less than 12s. to 13s. per week. Consider the enormous saving in these hard times—times of cheapness!!

DO YOU BRUISE THE OATS YOU GIVE YOUR HORSES? No. Then you lose one bushel out of every three, and your Cattle do not do half so well.—MARY WEDLAKE AND CO.'S OAT BRUISING MILLS. Superior Chaff Engine, simple in construction, doing from 50 to 500 bushels daily and more. Nearly all respectable Coachmasters and Brewers in London use these implements. To be seen at 118, Fenchurch-street, opposite Mark-lane, close to the Blackwall Railway.

N.B. Linseed Mills, Bean Mills, and Malt Mills, in great variety.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton ...	£10 0. 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 15s. per ton; and for 5 tons or more, 9l. 10s. per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

London, May 25.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8l. per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

The Agricultural Gazette.

SATURDAY, MAY 25, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	May	29—Agricultural Society of England.
THURSDAY,	—	30—Agricultural Imp. Society of Ireland.
WEDNESDAY,	June	5—Agricultural Society of England.
THURSDAY,	—	6—Agricultural Imp. Society of Ireland.

THE inquiry respecting a GARDEN FARM "of full half an acre—how to make the most of it—to make it remunerative"—printed in our number for March 23, from "A Country Curate of very small means," has, we believe, deservedly excited more interest than has yet appeared on the face of our pages. The declaration that his family did "not require the luxuries of the table, vegetable or other," grated harshly on the ear; for, from his position, he ought to have them in competent measure, if he has them not; if not for himself, at least for others; if not for his own household solely, then for neighbours and the sick poor. We will therefore offer a few hints, in the hope that the little patch of glebe may both be made as profitable as it can in inexperienced hands, and yet some few wholesome and decent luxuries be besides contrived to proceed from its cultivation. And the remarks we shall make may perhaps be usefully applied to the case of the farmer's garden—rarely a well-managed portion of his "occupation."

In the first place, as to the instruction to be derived from books. Paxton is excellent; but a student will know that to get a safe, that is a comprehensive knowledge of any one subject, it is good to read every book on that subject, that hands can be laid on. Glenny's "Gardening for the Million" (if it be not out of print) contains much that is useful; Cobbett's "Cottage Economy," and his other agricultural works, beautifully written, are still untrustworthy. Cobbett's practical value as an authority to be depended upon much reminds us of that of Voltaire; in this respect, they are both most lucid and charming writers, but, if you consult them on almost any special subject with which you are *well* acquainted, you will find them full of fundamental errors. Thus, in gardening and planting, Cobbett makes no distinction between the American summer and that of England. Hence the disappointment from Maize fields, Hickory woods, Catalpa groves, and plantations of other things which grow, but scarcely ripen, under our cloudy sky. DR. LINDLEY'S, LOUDON'S, and KNIGHT'S works, should be begged or borrowed, and read and re-read.

Some guidance how to manage certain crops having thus been obtained, an important advantage will be gained by observing a judicious *plan* of cropping the land, which is of more consequence in these cases than the mere rotation of crops, though that should be attended to, as far as may conveniently be, by making leguminous, cruciferous, and umbelliferous plants, each take their turn. In some allotments and cottage gardens, we see here a square of grain, there a patch of Cabbages, and so on, while these irregular phalanxes are now and then flanked by long straggling rows of Peas, Beans, or Scarlet-runners. The plot looks as if it were likely to become the more confused in its culture the longer it remained under cultivation by the same hands. Instead of this inconvenient muddle, let the land, if it be not a square, or a parallelogram or long square, be laid out as nearly as possible into conveniently sized parallelograms, and cropped entirely *in rows* extending the broad, not the long, way of these. The rows, which are each to consist of some one crop, may be of any breadth; the principle to be adopted will of course hold true all the same. All picturesqueness of arrangement is entirely discarded from this design, the grand object being convenience, utility, and an endeavour never to let the land be idle.

We suppose, then, an irregular piece of land, with the house at one end; we lay out in the centre one large, accurate, parallelogram, entirely surrounded by walks; if the ground be extensive, it will be convenient to make three or four such, all to be cropped on the same system: for instance, if three-fourths of, or even one entire parallelogram be cropped exclusively with Potatoes, it will still be the *row system*, in opposition to patch-work disorder. The odds and ends and trimmings of the land between the parallelogram and the irregular boundary of the garden are made into beds as nearly rectangular as possible, and applied to the raising and seeding of small matters, such as Radishes, salading, sweet and medicinal herbs, dwarf French Beans, &c., as well as for a temporary position for Cabbages, Celery, and those things that require pricking out. In the main body of the garden we place a bed of flowers as the front row nearest to the house; next, a row of Strawberries, which row may be either a plot of three or four beds, containing as many sorts, or a single line of plants, or none at all, according to the requirements of the cultivator; the successional order of the rest is likewise entirely optional, which constitutes one great merit of the plan. Asparagus sown where it is to remain, and the plants thinned out to their proper distance the second year, will cause little trouble or expense: the same may be said of Sea-kale grown as recommended in the *Gardeners' Chronicle*, vol. for 1847, p. 683. The writer of this supplies his own table, and has some besides to give away, with no further cost than the rent of the ground it grows upon, and the labour of earthing it up in winter, and unearthing it in spring: it is besides a crop which is always marketable by those who have the market in view, and it bears carriage to a distance well. Other crops may follow in the plan such as it may be desirable to raise. But of however great a width the rows are made, if, suppose, the space assigned to Cabbages extend to half the length of the parallelogram, these must still be planted in rows across it; and when the crop is cut, *each row should be finished and the stumps removed*, even though every single plant may not have attained its perfect maturity, before the cutting of another row is begun: for the strip thus vacated can be immediately manured and dug, and something

successional planted forthwith. The land will thus never lie uncropped nor get foul. Let a row of Beans or Cauliflowers be whipped in the moment there is planting room for them, and they will have half come to a crop by the time that the sluggard and the sloven would begin to think of hoeing the weeds which *ought* (according to *his* custom) to occupy their place for a while. We once knew an untidy market gardener declare that a few weeds—*i.e. not a few*—did the land good! But, in a large plot of Ash-leaved Kidney Potatoes—another remunerative, because early and inexpensive vegetable to cultivate—by taking up single rows, at intervals of 6 or 8 feet, as a first gathering, a crop of late Peas may be, not stolen, but coaxed, by these flattering and assiduous attentions, out of the liberal and good natured earth. So also of Celery, that most useful winter and spring vegetable, when there is little else to be had. Gooseberries, Currants, and Raspberries, may all be made to fall into the same plan of cropping; and if any of the perennial crops, like these, be thought unnecessary, or if the Strawberry beds become exhausted, they can be got rid of or dug in at any time; fresh plantations can be made, or the places occupied by something else, without the least unseemly gap, or even trace of ruinous removal. In short, the garden will be in a continual state of renovation and progress. If one kind of produce be taken in the morning, let some seed or seedling plant enter upon the vacant premises before night. For while men sleep, plants grow.

The next point to be considered is, *what* crops it may be most expedient to raise. And here, in the absence of any clue as to soil and situation, we can give only a few indications; and our remarks may, on that very account, perhaps be the more generally useful. The "Country Curate" will do well to make friends, as he is bound by his mission, with the neighbouring farmers of respectability. They will often give him valuable advice as to what is most prospective of a profitable return for his gardening labours. They will often, too, aid him by making little purchases for him, and by realising his produce—the great difficulty with persons in his position—on better and *smoother* terms than he could do himself. Besides the articles most in local demand, which this friendly advice will point out, a proportion of Wheat may perhaps be grown with advantage: under garden culture the produce may be large. The grain may be sent to the nearest mill, and the flour consumed by the family; the bran and the straw will come in for the pig—for a pig or two must be fattened every year—or both corn and straw can be turned into money. There may also be a proportion of Barley, which the mill will convert into meal for the pigs, to be in the end partially restored to the land as manure. A little of the Barley and the dross Wheat can be kept in hand for feeding or fattening fowls. Green spring food for horses and cattle is saleable almost everywhere, and in any quantity; therefore it may pay to sow in autumn a certain breadth of Rye, Rye mixed with Vetches, and Vetches alone, as successional crops. These in May and June will be worth from 6*d.* upwards the rod. As soon as they are cut, the ground must be made ready to receive Swedes, Turnips, Cabbages, Celery, Kidney Beans, or whatever else is requisite. Two or three crops in the year must be extracted from every yard of ground—a result which may be effected by contrivance and industry. The growing of a large breadth of *some one choice* seed of special quality, such as Mangold Wurzel, Turnip, Radish, Cauliflower, Pea, Bean, Onion, &c., frequently answers. In this speculation it is wise to get a previous order, and perhaps instructions as to particular points to be observed, from some seed-merchant of respectability and standing. Careful selection and most watchful culture are here needful; and the preservation of the ripening seed from winged vermin, and the housing it, are anxious tasks; but the crop, when safe, is very valuable. Large nurserymen sometimes require considerable supplies of certain plants that happen to become the mode. These, when of a hardy nature, may be budded, grafted, and propagated, as the case may be, with profit, if some understanding with the nurseryman has first been obtained. "*Il vaut souffrir pour les Roses,*" say the French, with somewhat of a double meaning, and more in *their* national spirit than in our own; "It is worth suffering for higher than mere pleasurable ends," would be the *mot* of a right-minded Englishman; but a few literal scratches and thorns will not be heeded by those who can perform the operation of budding, and to whom the remuneration for the labour is of essential importance.

And now as to live stock; for *some* there must be. Farmers, however good-natured, do not like obliging a friend too often with manure; and the greater the distance from a market, *i.e.* a town, as in the "Country Curate's" case, the more hard-hearted are they likely to be in this respect. So our garden-farmer must learn a good lesson, and depend upon his own resources. Muck is a necessary link in the endless chain of production and reproduction. It would be well here if a pony *could* be kept, and a handy lad to look after it, and help to dig and weed. A cow would produce both too much and not enough, and that in varying measure. Without the cow and the lad, the breeding sow would be a burden and a nuisance. The pigs, eight weeks old, calculated by our Lincolnshire informant at 12*s.* 6*d.* each, are supposed to fetch higher prices than could be obtained elsewhere at the same date. Besides the periodical sale of a litter of pigs becomes an actual annoyance to those persons who cannot, from the station they occupy, enter into the fun of enjoying the manœuvres of the little dealers. No; it must come to the store pig or two, bought in by, or of, a friendly neighbour, for the purpose of consuming and trampling into manure all refuse produce, dead leaves, and so on, that can be thrown down to them. But there must, moreover, be the utmost economy and covetousness as to everything that can be suspected to have a fertilising power, whether soap-suds, ashes, slops, or what not,—that is thrown out from the house; or, the *kosmos, i. e.*, the general order of the garden establishment, cannot go on as it ought. A few tame rabbits, for table supply, will be found very convenient, though not particularly profitable. A cock, and three or four hens, may be kept in some rustic aviary, which may be the contrivance and handywork of the proprietor's leisure hours; and it is surprising how well certain kinds of the domestic fowl will thrive in this way, if they are now and then indulged with a walk out of bounds. If any of these *are* kept, they should all be of one first-rate kind; for their grown progeny will be saleable at higher than ordinary prices, to the large metropolitan dealers, such as Mr. Baily, of Mount-street, who often in this way procure from country correspondents whom they can depend upon, those pure-bred and select specimens that are ordered by wealthy amateurs. Bees are very interesting to have, and they give a cheerful-practical look to a place; a glass cap of honey is an elegant dainty to place upon the breakfast-table; but can they safely be calculated on as a source of income? The garden-farmer who reckoned upon paying, not his rent, but merely his rates and taxes, from the profits of their produce, would, we fear, be subject every other year or so, to very unpleasant proceedings undertaken in the name of her Majesty. One year in five,—for we do not wish to speak too harshly of the English seasons, or treat them with the same severity that they are too apt to treat us—one year in five may be really a good year; and then, down comes the price of honey.

May we be allowed to add a few words on the *morale* of the inquiry which we are endeavouring to answer, although perhaps this department of advice-giving may scarcely lie within the province of the *Agricultural Gazette.* While profit may be the main and needful object, a liberal conduct should be combined with this pursuit.

The trifling matters that would be degrading, if Mammon held governance over them, how priceless are they, if administered with Christian, and that is true gentlemanly, liberality! A dish of Seakale, or Strawberries, or Asparagus, carried, with a kind word, to an invalid neighbour or neighbour's child, will heal a schism better than a personal sermon, a severe private lecture, or even a suit in an ecclesiastical court! A garden may be called a *paradisus* when it can thus be made to produce the fruits of peace, instead of just bringing in a few shillings a year in excess of the outlay. But if, unhappily, hard money is so needful to any, that they must debar themselves, for it, from these their fitting luxuries; then, a not offensive, and probably the true and best piece of advice, is, "You would do more wisely to let your land, and be satisfied with the rent of it, than to aim at the profits possibly derivable from cultivating it; for in unskilled hands they will dwindle and disappear."

STEAM POWER AND PRESENT PRICES.

Can any of your numerous and talented correspondents give me an answer to this one simple question, viz: What is the most desirable, the most advantageous, the most necessary to be sought for, to render agriculture a profitable business at "present prices?" The *Agricultural Gazette* teems with suggestions. I have endeavoured to examine impartially these suggestions, and find all of them (since agriculture is a manufacture) may be appropriately typified by or under the mechanical simile of "little wheels." The first suggestion is "economy;" under which is implied "no black horse-ponds," in other words, manure manufacturing and manure preserving is to be a constant study. Will this "little wheel" render agriculture a profitable business? No. Will cattle-feeding? No. Will pig-feeding? No. Will sheep-feeding? No. [Prove it!] So the whole "head" of stock may be dismissed as incapable of themselves, by themselves, of rendering agriculture a profitable business. Manure maybe dismissed with the machines. Everyone of these items may contribute a mite, but, it is such a mite, that the whole may be justly designated as "little wheels."

We will now leave the farm-yard and go into the fields—here we relinquish the item of economy, and come to that of skill or knowledge in operating on the material. The first little wheel we came in contact with (and by the bye this is the largest and most influential wheel of the whole series) is drainage. Now, will drainage of itself, by itself, render agriculture a profitable business? No. Will the removal of hedgerows and timber? No. Will subsoiling? No. Will superior cultivation by hoeing? No. Will thick or thin-seeding? No. Will artificial manuring or ammoniacising render it profitable? No. And, moreover, this last little wheel is the crankest concern of the whole lot. It is evident this catenary of items, with their various ramifications, is composed entirely of little wheels. Is there any one of these little wheels possessing sufficient power within itself of restoring agriculture? Certainly not. But some may say the whole together will; nay, that cannot be, for the strength of one link generally gives the strength of the whole chain. But you will further say "to adopt your mechanical language, we 'weld' the whole together, and thereby make an uncommon strong link." Yes, but there is another unlucky maxim in mechanics which may be opposed to this argument, viz: that what you gain in power by combination, you lose in time—and time is money! You cannot afford now to wait 12 months for the muck-money, nor the subsoil, nor the drainage money. What you require in your art to place you more on a par with your fortunate brother manufacturer, is a comparatively quick return for a small outlay. To this you will reply—But our crops cannot return aught under six months! Then to counterbalance that inherent drawback, the investment in proportion to what is returned should be a minimum; if you can receive a large per centage in six months for a small investment, that will be tantamount to a small per centage on a large investment, for a month. Your business in proportion to its extent positively requires the least capital of any art I can recall to my memory; it is in itself a cheap practice. But, you will say, we find it very dear in both first and last expense? No doubt about it; but, how is it that you have rendered a cheap practice both dear and unprofitable? This is the point I wish to bring you to consider. I hope we shall ultimately find out that it has arisen from the wants of true or useful science in the simplest of all human arts.

We may fairly assume, then, that the little wheels of agriculture being perfect in their way, but inoperative, the fault, error, or defect is in the "great wheel." It is the same with the domestic agricultural machinery as with every other of the sister arts—they must both have a "great wheel." That great wheel is of course the prime-mover—the mover of the "little wheels." Now what then is the constitution of the great wheel of agriculture, because it is evident the fault lies there?

My object in writing is this: I wish agriculturists to understand—thoroughly understand that the defect may be in their great wheel; and it is advantageous to discover what is wrong, even though we should not at the moment know how to repair the defect. To know the cause of a disease, the doctors tell us, is at least halfway towards the remedy, because we shall then, like sapient men, the more strenuously, assiduously, and heartily strive after that remedy. We must be struggling in the dark, when we do not know what it is we most stand in need of.

Now, I say, the whole, sole, and utter incapacity of the English farmer to compete with the foreigner, in conjunction with his brother manufacturer, is simply because his "great wheel" is defective; in other words his "prime-mover" is defective. And that I may substantiate this, or rather compel my brother agriculturists to do it for me, I shall put a question at the end of this letter (which after all is the question of the letter), and which question is to stand as an estimate of true valuation of all other manufactures, and by parity of reasoning serve the same office to agriculture; and I hope some of your readers will return me a candid answer thereto. I put the question in a friendly way, and with the hope that it will lead the minds of agriculturists from such incessant study of the "little wheels," to the infinitely more important study of the "great wheel."

Agriculture has existed upon, or, lives in facts—what she most needs now is "principles"—standard principles. It is principle that leads; facts are as nothing without it. Now that the comparative worthlessness of the political aid to a practical art has been demonstrated by the possibility of this unsubstantial aid being at any time withdrawn by those who gave it, leaving its quondam recipients in the lurch, we should now strive the harder to obtain that aid which no human power can remove. Let us seek to establish the principles of agricultural operations on a true and indestructible basis; that basis has evidently never yet been obtained, or we should not find ourselves in this helpless predicament, when the "crutch" has been withdrawn. The agricultural fabric was in truth an eyesore to the eyes of "progress;" but still the actual cautery was a rough remedy to apply; the patient might sink under the operation; but sturdy agriculture is not of that constitution—she will recover, but, the cure must proceed from herself. Begin *de novo*—strive to perfect every principle of your practice. My maxim for the esti-

mating a principle to be established is this—viz., a simple and certain principle in practice, which cannot be followed without profit, and which cannot be departed from without loss.

Now there are several principles to be established on this foundation in agriculture, and the enquiry should be, which is the first in importance to be studied, which the second, which the third, and so on. From the host of little facts exhibited in agricultural writings, I gather that the whole lot are dealt with at one and the same time. Now this should not be; the agriculturist has often been justly reproached for distributing his money and his manure over a too large space, and I think he may be somewhat reproached for distributing his intellectual powers also over too large a space. Concentration is strength, and so is unity, whether of mind or anything else. Side dishes, like the little facts of agriculture, are very good things, very requisite, and always read and viewed with pleasure, but there should be a genuine substantial matter for us all to dissect and digest nevertheless.

Suppose we now deem it of individual and national importance first to study and then establish genuine, that is, permanently profitable principles, for future agricultural practice. The enquiry will be, what is the first or primary principle in agriculture? I say the mechanical, others may say drainage is. Nay, that cannot be, for drainage will not cultivate *per se*. Another will say, chemistry is. Nay, that cannot be, for chemistry will neither insert the seed in the ground nor withdraw it therefrom. Another will say cattle-feeding, another the rotation in cropping, another thick or thin-seeding, &c., and probably the last and worst on the list will assert the "political" is. But I affirm and believe it will be admitted that the mechanical is the primary principle to agriculture. The question then is, is this primary principle established? Does it fulfil the maxim I have offered, viz., a principle which all may follow with profit, and none depart from without loss? Certainly not. But this principle, like those which will succeed it, may or must be divided into two parts, the primary and the secondary. Now the primary principle in the mechanical is the power employed, and here at once we prove that the mechanical is not yet established in agriculture, for, some use oxen as the prime mover, and others horses, and as usual when this occurs some advocate the one and some the other; from which we may infer that they are both so inferior, or rather, the one to the other is so little superior, that neither are worth much. Now, can we find a primary power in existence which will fulfil this requisite of "which no one can adopt or follow without profit, and no one neglect or depart from without loss?" because, this would afford us an opportunity of seeking to establish the primary mechanical principle in agriculture on a secure basis; the result of success being that it would influence and facilitate our approach to all the rest. I think this subject is of vast importance, because if the mechanical be the primary—chemistry, drainage, &c., must be secondary; and if you, neglecting the perfecting the primary, proceed to the secondary, why the result of your best efforts must be comparatively weak, imperfect, and profitless: unless you study to make the "great wheel" perfect, how can you possibly expect the little wheels "to do their duty?" You may analyse in chemistry for ever, and dig at drainage till doomsday; but except you render the prime-mover perfect, how can you expect the little wheels to operate with effect? Their efforts must be neutralised or rendered nugatory from the lack of perfection in that on which they depend. In another letter I wish to offer some remarks on the erroneous ideas entertained by the steam ploughman.

That question, the question of this letter which I wish to put to Mr. Huxtable, Mr. Mechi, Mr. Davis, and others as agriculturists; to Messrs. Ransome, Crosskill, Garrett, &c., as mechanists; and, to the agricultural chemists, is this "What would be the profits to cotton and other manufacturers on their products, at present prices?—What would be their profits if you withdrew the prime-mover they now employ, and compelled them to move the 'great wheel' of their machinery by the living horse? By the aid of this latter power what would be the profit on cotton goods at the present prices?" If any of these gentlemen will kindly answer me this question I shall be much obliged. I need scarcely add that nothing whatever is to be subtracted from the present economy of their manufactures, but the power, that power being merely replaced by the farmers' power. This done, what would be their profits? *C. B., Heacham, Norfolk.*

Home Correspondence.

Flax Cultivation in 1758—(from a letter dated Londonderry, 13th Dec., 1758).—Having observed with great concern the difficulties which we lie under in our linen manufacture, through the neglect of preserving our own Flax seed, the immense annual expense we are at in importing it from America or the Baltic, and the danger we are in some years threatened with of a total failure of this our staple manufacture either by accident at sea, or the importation of bad Flax seed; I determined to make an experiment whether we might not preserve as good Flax-seed at home as any which comes from abroad, and at the same time save the Flax, and make it fit for manufacturing early in the same season. To this purpose I applied to Mr. David Melvill, at the Linen-hall, for his advice and direction, who approved of my setting apart one of my fields near Londonderry, containing 3 Scotch acres, which is very little more than 2½ acres plantation measure. I sowed my Flax-seed in April, and most strictly adhered to Mr. Melvill's direction in the whole culture and management of my Flax crop—in preparing the land, sowing, rolling, pulling, watering, and beetling the Flax, as also in preserving the seed. In consequence of this I have nine hogsheads of as good Flax-seed as any ever imported from Holland or the Baltic, which I can sell at 2*l.* 15*s.* per hogshead. I let the Flax grow till it was full ripe. It was, in length, from 3 to 4 feet. After fermenting and beetling, it was made up into bundles weighing 20 lbs. each; of these I had 658 bundles, which, being dressed, each bundle turned out 5¼ lbs. of clean Flax fit for the market, which I can sell at 5*d.* per pound, and I am well assured that it can easily be heckled to spin into ten-hank yarn. I had the misfortune to meet with bad weather when the seed was ripe, which obliged me to defer pulling the Flax for nine or ten days, whereby near one-third of the seed was lost. I lost as much of the Flax as would make 100 bundles by the accident of horses breaking into the field. Notwithstanding these losses I have saved nine hogsheads of Flax-seed, and 658 bundles of Flax. The whole produce of the field comes to 91*l.* sterling, out of which, deducting 31*l.* for the rent, seed, culture, and expense of saving the seed and Flax, the net profit is 60*l.* I kept an exact account of all the expenses, and I make a large allowance. The success I had in this, my first attempt, encourages me to prepare and sow 7 acres with Flax-seed in the same manner this ensuing season. I have engaged above 40 of our farmers to come into the same method, and I hope this success will encourage all our farmers to pursue it, as they will thereby not only save a sufficient quantity for the use of the kingdom, but also will soon, from experience, be convinced of the superiority of ripe Flax over the unripe (as it is now generally when pulled). It will have a much greater produce, will be easier manufactured, and will be of considerable advantage in every branch of the manufacture. By the method I pursued, the great objection from stacking up the Flax, and postponing the manufacturing it for a season is removed; for I had all the seed saved in August, and the Flax prepared for the market in September and October, and I apprehend if this method of Mr. Melvill's is pursued, it will be an immense saving, and of the utmost advantage to the kingdom in general. *Anon.*

Wages of a Lammermuir Shepherd, 1850.—

1. House and garden, with peats cut by servant, and carted by master	£2	0	0
2. 1000 yards Potatoes, in 30-inch drills, at 6*d.* per score yards	1	5	0
3. Cow's keep per annum	5	0	0
4. 35 sheep grazed with master's, at 7*s.*	12	5	0
5. 80 imperial stones of Oatmeal, at 1*s.* 3*d.* per stone	5	0	0
6. 1½ quarters Barley, at 17*s.* 9*d.*	1	6	7½
7. Half-quarter of Peas or Beans	0	12	0
Value in Money	£27	8	7½

A Lammermuir Farmer. [Do you give no money at all?]

Wages of Labourers.—There is one point on which I cannot refrain from saying a few words—the practice of keeping a sort of open tap to farm labourers in cider countries. Take for example Worcestershire and Herefordshire, where the allowance varies from 1 to 10 gallons daily! Why a man might as well keep a public-house, and better too, because there would be a profit hang to that; whereas, here, it is all bother and no pay. Nay, even the failure of the cider crop is no advantage to the poor farmer; for drink he must find, either in meal or malt, as the saying is. I am afraid to name the sum which a farmer in this county once told me it cost him for malt to make good the deficiency in his stock of cider. The practice is got to such a pitch, that no conscientious man would willingly encounter it—how much less a teetotaller! I was once set to look out for a farm in this neighbourhood for a friend. I saw several; all boasting as an advantage of the oceans of cider and perry they could produce. Poor fellow! what was he, a regular out and outer in the temperance line, to do with such commodities? He had over and over again denounced them by retail; was he to go into the trade, wholesale, as it were. No, he wanted a farm, but (as they say of married men), "without incumbrance." Another friend of mine, then a resident in Lancashire, once bought an estate in Herefordshire, which he farmed himself. He resolved to break the neck of this cider swilling, and the way he set about it was this: he turned off all the old Herefordshire hands, and imported in their places a lot of Lancashire men, to whom, as an inducement to come, he was to pay much higher wages than the others, but not a drop of cider; a bargain the new settlers very readily agreed to, inasmuch as it was an indulgence they knew very little, and affected to care still less about. In course of time, however, they got a taste of the cider, and from tasting they came to downright guzzling, till their master found they were even worse than their predecessors; for they drank as much, or more, besides receiving extra pay for professed abstinence from the unclean thing! I dare say you have seen a lot of new bricks dipped into water to prevent their absorbing too rapidly the moisture of the mortar. And what a sight of water they will suck up surely! just so was it with these Lancashire bricks. They did imbibe wonderful, that's a fact; and the discovery was soon made, that of the two evils, the old one was the least: a sort of counter-revolution was the consequence, the former dynasty being restored, but with certain wholesome restrictions as to amount of allowance per diem. *Peter Stubbs, Gloucester.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

LECTURE ON SOILS AND MANURE.

Professor Way, Consulting Chemist to the Society, repeated, at the request of the Council, his lecture "On the Absorptive Properties of Soils in reference to Manure," on Wednesday, the 15th of May, in the presence of a large number of the members, at the House of the Society in Hanover-square. The chair was occupied by Mr. Raymond Barker, one of the Vice-Presidents of the Society; and among the company present we remarked Lord Braybrooke, Lord Bridport, Lord Camoys, Lord Charles Manners, M.P.; Hon. R. H. Clive, M.P.; Hon. Henry W. Wilson, Hon. J. J. Carnegie, Sir Robert Price, Bart., M.P.; Sir R. P. Jodrell, Bart.; Mr. Alcock, M.P.; Mr. John Bethell, Mr. Burke, Mr. W. G. Cavendish, M.P.; Mr. Chadwick, C.B.; Colonel Challoner, Mr. Clavering, Dr. Drummond, Mr. Dyer, Mr. Overman, Mr. E. Parkins, Mr. Pendarves, M.P.; Mr. Beauchamp Proctor, Prof. Sewell, Prof. Simonds, Mr. Slaney, M.P.; Mr. Stansfield, M.P.; and Mr. Wilson, of Stowlangtoft.

Prof. Way commenced his lecture by giving a short statement of the circumstances which had led him into the train of investigation that had resulted in the important facts to which he was again invited by the Council to call the attention of the members. About two years ago, the Rev. A. Huxtable had stated to him that urine, by its passage through certain filtering substances, might be so entirely deprived of its colouring matter and characteristic odour, as to be rendered in every respect, to the senses, as tasteless, inodorous, and colourless as spring water. About the same time, Mr. Thompson, of Moat Hall, related to him the singular effect of soils in arresting the volatile alkali, ammonia, when brought in contact with them. Prof. Way was not only deeply interested in these statements, but totally unable to account on chemical principles for the effects thus simply produced; and of so high a degree of importance did he consider them, as fertile in a series of new facts, which would lead not only to new views of chemical combination, under peculiar mechanical conditions, but also to a modification of the theory of the mode by which manure is reserved in the soil until required as food for plants, and to immediate applications in practical agriculture; that he lost no time in verifying these results, and in endeavouring to account for their occurrence. As he proceeded in this path of inquiry, the new facts, as they rapidly succeeded each other, were such as would have been totally unexpected on the ordinary principles of combination; and which would eventually, he had no doubt, lead to new modes of regarding chemical action when taking place under certain mechanical conditions. He had pursued these researches with undiminished interest and attention, until at length his results were brought to that connected and established form in which they could be laid with confidence before the Society, and the details submitted to the Journal Committee for publication. He had the great satisfaction of finding that Mr. Thompson also had pursued his inquiries on the same subject, and would be able to submit the results of his experiments to the Journal Committee. Carried out independently of each other, as Mr. Thompson's experiments and his own had thus been, it was highly gratifying to him to believe that the results obtained in each case would be found to be nearly the same, and their truth accordingly confirmed in the most satisfactory manner. Prof. Way then proceeded to show experimentally the power of finely-divided clay soils to abstract the colouring matter and smell from logwood water, London porter, putrid urine, infusion of Flax, and tank water; and to explain the probable manner in which such soils decomposed the salts of ammonia, arresting that alkali and replacing it by lime; and also by what a beautiful provision of Nature the substances valuable as food for plants were retained in the soil, while other results of such decomposition were allowed to pass through it, one of those provisions in the operation of natural laws which strikingly arrest the attention of the most inconsiderate, and mark the beneficence and wisdom of the Creator, of whose works only perfection is the unvarying attribute. Professor Way then congratulated the Society on the manner in which his Royal Highness Prince Albert had so strongly drawn public attention to the purification of the sewage of towns and the application of the manuring matter contained in it to the purposes of agriculture. He also referred to a great advantage possessed by the plan of upward filtration adopted by his Royal Highness for carrying out these important national objects, namely, the avoidance of that incrustation formed on the surface of downward filters by sewage water on clay, which retarded in a considerable degree the progress of percolation. Professor Way then proceeded to discuss the various conditions under which the new principle under consideration was found to prevail, and the explanations it furnished in the various practical applications connected with irrigation, artificial manuring, and sewage or tank water. As these details are similar in their character to those which formed the subject of the former lecture on the same subject, on the 20th of March last, and were fully reported to our readers in our first publication after that date, it will not be necessary to repeat them. The lecture on this occasion, as on the former, excited the most lively interest among the members present, and, at its close, an unanimous vote of thanks was passed to Professor Way for his kindness in repeating the lecture, on the motion of the Hon. J. J. Carnegie, seconded by Sir

John Johnstone, who concurred in expressing a hope that the Council would make arrangements for the continuance of these important lectures, and that Professor Way would kindly continue to favour the members with their delivery.

Mr. CHADWICK, referring to the communication made to the Society at a preceding meeting from Prince Albert, said it must be a matter of satisfaction that the direction taken by the studies of such men as Mr. Huxtable of ascertaining for the benefit of agriculture what the earths would detain, of the matter conveyed in solution or suspension by liquid manures, had been independently comprehended in the mind of his Royal Highness, with yet wider interests, when he had given his own attention, and had directed the attention of the Society to the conversion of the sources of pestilence into the means of fertility. He (Mr. C.) might state to the Society, that his colleagues of the General Board of Health, deemed it an event of great importance to their proceedings, that the Society had under these high auspices opened practical investigations so important to the populations of towns as well as of the rural districts. The fact must have been in the Prince's high view and forecast, that these investigations would tend to make manifest to the town and the country their mutual dependence, abate differences, and strengthen common interests. His Royal Highness would no doubt regard with much interest all well directed experiments upon the subject. Under the necessities of considering in what way the manures which encumbered the worst-conditioned districts of towns could be disposed of, he (Mr. Chadwick) had read all he could find, and enquired as to what had been done, not only in this country but in Belgium and other countries, especially with the liquid manures, by horticulturists as well as agriculturists; he therefore felt himself qualified to speak as to the originality of the views now propounded by their Professor. It had been hitherto the general belief that liquid manures were merely deposited in the soil in slight suspension, and that their effects were transient. In displaying the chemical action that took place, and the conversion of the manure into the permanent and insoluble form, which was not to be washed away by the first shower, a very serious obstacle to the use of sewer manure had been removed. At Liverpool and some other places it had been objected, that inasmuch as the sewer manure could only be used upon the growing crops, that is to say during short periods in the year, enormous reservoir room must be required, and the storage of sewer water must of course be a nuisance, and therefore it was argued it must still be thrown into the river. Now the Professor, in showing the greater permanence of the effect of the manure, had proved that it might be applied throughout the whole of the year, with no other interruption than the frost. He (Mr. C.) could give an instance in corroboration of the Professor's view. Trials of sewer manure were promoted by Lord Ellesmere on some farms near Manchester, for one year, but notwithstanding eminent success the first year, some of the farmers in despair, or in pet, during the second year would do nothing with the land; to the surprise of all parties, however, the fields manured with the liquid manure gave as good a crop the second year as those which had been heavily top-dressed with solid manure, and even as those which had been recently dressed. Professor Way, in showing the immediate chemical action of the manure upon the earth, or of the earth upon the manure, had shown how unfounded was the objection to its application, near the town, arising from the apprehension of the nuisance it must create. He Mr. C. could offer facts in corroboration of the Professor's conclusion. It was found in the distribution of liquid manure, containing three loads of night soil, in about seven times its bulk of water, as a dressing per acre. If such a quantity of human fæces were spread upon land undiluted, they must be aware what a nuisance it would be for days and weeks. Parties were surprised to find, that, within little more than half an hour, after the delivery of the liquid manure upon the land they might pass over it, without perceiving what had taken place; and so it was with sewer manures, distributed in a high state of decomposition. He hoped, however, that it would shortly be shown how erroneous in an engineering point of view was any system of house and town drainage, which occasioned the retention of such matter underneath habitations in a state of decomposition (and waste), and which did not remove it clear even from beneath from so extensive a site as the metropolis before it could pass into the state of decomposition. Even in its present usual state of delivery the effect of the earth upon it, and the immediate suppression of smell, was quite remarkable when the manure was so applied in the liquid form as to favour the chemical action of the earth. Persons at the west-end were accustomed to complain, and properly, of the effluvia arising from the solid manure spread on the surface of the parks. This manure, with three or four-fold fertilising powers diluted in water, might be applied in the liquid form early in the morning, and persons passing over them soon after would be unable to detect what had taken place. The application of sewer manure might even now be proposed as a means of obviating the nuisance arising from the common methods of manuring in such cases. The light opened upon them by the Professor's experiments on the powers of soils to detain matters in solution or suspension in common water were of the highest order of importance. Those who had read the older writers on irrigation would be aware how faint was the perception of the cause of the different fertilising powers of different waters, some ascribing them to warmth solely, others to rapidity of its motion, and others to the simple absorption of the water; on all this obscurity light was now dawning. The researches displayed before them had an important bearing on the supply of water to towns. He had considered the determination of what the earth would detain, of the matter carried into it by the fermentation of the surface rain water, so important as bearing upon the improvement of the water supply of towns, that he had proposed the subject as one for the investigation of the new college of chemistry, when it was first instituted; but it was objected that it would require the labours of a multitude of chemists. It was due to Professor Way to say that he had shown how much could be accomplished by the well directed exertions of a single hand. In showing how large a proportion the clays would, by thorough drainage, detain of what was good for the land, namely the lime contained in water, he displayed a valuable quality of depuration for the water supplies of towns in arresting the ingredients which were bad for them, more especially the lime, which rendered water hard, which diminished its solvent power for food, rendered the washing of the skin disagreeable, and the washing of clothes, by the increased quantities of soap required, more expensive. He might mention, for the information of the Society, that the investigations conducted under the General Board of Health, for the improvement of the sanitary condition of towns, strongly displayed the superiority of surface drainage waters over well and river waters. Out of upwards of 400 different waters, from different places and sources, examined under their directions, the general results stood thus:—the deep spring or well waters were of 20 degrees of hardness; the river waters were of 13 degrees of hardness; and the land drainage waters were of 5 degrees of hardness. These last degrees denoted the general rank of the land drainage water in relative purity when properly collected; they formed the ground for expectation of wide arrangements for the relief of land from the surplus water which encumbered it and impeded its fertility, for the service of the town districts which required it, and which would return it with powers of fertility for the disposal of the agriculturists. The researches opened by the Society would serve for the guidance of these great processes.

Mr. SLANEY, M.P., thought it very fortunate that his colleague, Mr. Chadwick, was present on that occasion, to bear his high testimony, as a practical authority on every question re'ating to the sanitary condition of towns, to the value of Prof. Way's researches. As Mr. Chadwick's coadjutor on the commission relating to that enquiry, he (Mr. Slaney) had himself visited many towns in the kingdom, so favourably situated for drainage, that their fall alone would, by very slight direction, carry off the whole of their sewage, which would bring great quantities of land throughout the country into a state of fertility. He hoped experiments would be made on this subject in the mode so clearly pointed out by Prof. Way. He (Mr. Slaney) had himself already made such an experiment on a piece of sour land of his own in Shropshire, which he had drained, subsoiled, comminuted, and manured; and the result was such a crop for the first time as to excite the astonishment of his neighbours. According to the principles laid down by Prof. Way, manuring might take place at any time throughout the year, excepting during the prevalence of frost and rain; thus increasing the wealth and strength of the land, and at the same time removing from the poorer classes the immediate cause of many of the evils affecting their health and comfort. Mr. Slaney then ventured to offer two suggestions: 1. Whether an instrument, similar to the saccharometer for ascertaining the amount of sugar in wort, could not be contrived for ascertaining the amount of manuring matter in sewage or tank water; so that by a preliminary testing with such an instrument, the strength of the liquid manure might be obtained by inspection, and the number of gallons or tons at once determined, which it would be requisite to apply to a certain quantity of soil of the same quality, and for any given purpose. 2. Whether the rate could not be ascertained, at which equal successive depths of soil have the power of taking up manuring matter.—Col. Challoner agreed with Mr. Slaney, in hoping that experiments would be tried on this subject. He dwelt on the advantage he had himself already derived from the former lecture. He had directed his farm-bailiff to collect together the scrapings of his yards, the bottom of ditches, peat, and earth; and he had so arranged his tank that every drop of liquid manure was caught. He had directed heaps of manure to be formed of these substances, with alternate layers of clay intervening, which he hoped would arrest the manuring matter as it became soluble, and attempted to pass through it, and thus obtain for him a much larger amount of that valuable substance than he had hitherto been able to secure, as the liquid would in that case pass out as clear and tasteless as water. A test would thus be afforded of the efficiency of the plan, which was so simple that any farmer might, by its means, avail himself of Prof. Way's researches, and satisfy himself of the correctness of his theory. He himself thanked Prof. Way for what he believed would prove a future advantage to practical agriculture.—Mr. Towers, of Weald Hall, stated that he had extensive trials in hand, on his estate in Essex, on the application of every kind of artificial manure and sewage he could meet with; and he would be happy to receive Professor Way and other members of the Society who would favour him with a visit, and submit to their inspection the arrangements he had made for those trials. His land consisted of singularly poor soil, in some parts sand and clay, in others wholly sand. He conceived the sewage of towns to contain untold wealth to the land, if properly deodorised by charcoal or other substances, and rendered in a fit state to be shipped from the place of manufacture to different ports along the coast of the kingdom. He agreed with Mr. Slaney in the necessity for draining, subsoiling, and manuring, as preliminaries to good cultivation. He concluded by referring to the experiments of his neighbour, Mr. Harvey, in ascertaining the value of a mixture of urine and distillery wash, as a liquid manure. He had already found it very powerful in its operation, but so great a nuisance in its present state as to render its application on the land inconvenient to his neighbours.—The Chairman concluded the proceedings by referring to the arrangements made by the Council for the delivery of these lectures; and the high gratification he had felt in again listening, on that occasion, to the important lecture of Professor Way, to whom he expressed personally his best thanks.

AUDIT OF ACCOUNTS.—The half-yearly audit of accounts was held at the Society's house, on Friday, the 17th inst.: present, Colonel Challoner, Mr. Raymond Barker, and Mr. Henry Blanshard, on the part of the Finance Committee; with Mr. Thomas Knight, of Edmonton, and Mr. Robert Beman, of Donnington, two of the appointed auditors on the part of the Society.—The whole of the accounts connected with the half-year ending December 31, 1849, having been laid before the audit, they were duly examined and certified as correct, under the signatures of the auditors then present; the total receipts during the half-year (including the balance in hand) being 5517*l.* 12*s.* 2*d.*, and the total payments 4474*l.* 11*s.* 9*d.*, leaving a balance in hand at that date of 1043*l.* 0*s.* 5*d.*

SPECIAL COUNCIL.—A Special Council, for agreeing to the Report to be made to the ensuing General Meeting of the Society, was held on the same day, Mr. Raymond Barker, V.P., in the chair. The various topics of business transacted by the Council, since the previous General Meeting in May, having been taken into consideration, the Report, on the motion of Sir Charles Lemon, Bart., M.P., seconded by Colonel Challoner, was finally agreed to, and ordered to be laid by the Secretary before the General Meeting, to be held on the followiug Wednesday.

GENERAL MEETING.

The half-yearly general meeting of the members was held at the Society's House, in Hanover-square, on Wednesday last, the 22d of May; Mr. Raymond Barker, V.P., succeeded by the Marquis of Downshire, President, in the chair. On the motion of Colonel Challoner, seconded by Mr. Druce, of Ensham, the Duke of Richmond was unanimously elected President of the Society for the year ensuing the Exeter meeting to be held in July next. Mr. Barker laid before the meeting his correspondence with the noble Duke on this subject, in which his Grace expressed the satisfaction it would give him at all times to obey the call of the Society to any station in which they thought it might be in his power to aid its laudable objects; he also expressed his regret that temporary indisposition prevented the personal attendance he had hoped to give at the meeting on that day.—Colonel Challoner, in proposing the Duke of Richmond to thus fill, for a third time, the highest office in the Society, passed a high eulogium on the noble Duke's long devotion to its interests, and to his powerful co-operation in promoting, on every occasion, its welfare, and the successful carrying out of its national objects.—On the motion of Lord Camoys, seconded by Mr. Brandreth, the Trustees of the Society were unanimously re-elected. On the motion of Mr. Grantham, seconded by Mr. Dyer, the Vice-Presidents of the Society were unanimously re-elected. The meeting then proceeded to the election of 25 members of Council; and the Chairman having named Mr. Barugh Almack, Mr. T. Knight, and Mr. G. Dyer, as Scrutineers, who retired with the balloting lists into one of the committee rooms, those gentlemen on their return from this scrutiny, declared the house-list of the Council, to have been unanimously adopted by the meeting, and the following 25 members to have been elected on the Council for the two years ensuing the Exeter meeting, namely, Lord Ashburton, Mr. John Beasley, Mr. Henry Blanshard, Mr. French Burke, Lord Camoys, Mr. W. G. Cavendish, M.P., Mr. S. Druce, Mr. R. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Jonas, Mr. Kinder, Mr. Lawes, Sir Charles Lemon, Bart., M.P., Hon. Capt. Dudley Pelham, R.N., M.P., Prof. Sewell, Mr. Shaw of London, Mr. Shaw of Northampton, Mr. Sheridan, M.P., Mr. Sillifant, Mr. Slaney, M.P., Mr. Robert Smith, Mr. H. S. Thompson, and Mr. Jonas Webb.

Mr. Hudson, the Secretary of the Society, by direction of the Chairman, read the following Report from the Council.

REPORT.

The Council have the satisfaction of reporting to the members at their present half-yearly meeting the most favourable condition of the Society, at the completion of the 12th year from its foundation. Although in point of numbers its census is diminished by 127 members since the last general meeting, such diminution is in a great measure more apparent than

real; for the average number of members periodically lost to the Society by death being deducted, the remaining names removed from the list will be found to be those of parties who have joined the Society at its country meetings for the local and temporary purposes only of the occasion. On the other hand, members of a permanent character, who feel a deeper and more general interest in the welfare of the Society and the promotion of its national objects, are constantly elected into its body, and are gradually increasing its list of efficient members. The Society at the present time comprises 5261 members, namely, 90 life governors, 169 annual governors, 627 life members, 4356 annual members, and 19 honorary members.

The funds of the Society are in a highly satisfactory state; every claim against it has been constantly discharged as it has become due; an ample cash balance lies available for current purposes in the hands of the bankers; and the invested capital has at length approximated to the gross amount of those sums which have been received from time to time, since the commencement of the Society, as compositions for life. The arrears of subscription, so long the source of trouble to the Finance Committee and of irregularity to the income of the Society and its means of usefulness, have at length, by the persevering attention of that Committee, been brought under salutary control, and placed in train for final settlement. The names of defaulters, whose tardy fulfilment of their obligations to a Society into which they had voluntarily entered, and whose unwilling compliance with the chartered regulations of the general body, have thus occasioned so much inconvenience to the Society and injury to its available income, have been gradually removed from the list of members, and replaced by the names of willing contributors to its funds, who cheerfully acquiesce in a recognition of the validity of general laws, enacted, under the charter of the Society, for indiscriminate application to all its members, and for carrying out by united efforts the great and useful objects of their incorporation. The Council, in dealing with this question of arrears, have accordingly felt it their bounden duty to the body at large, acting as their representatives and the appointed guardians of their common interest, to take the most decisive measures for bringing the settlement of this long-contested question to a final issue, by an appeal to the county courts of the kingdom. The administration of the Society being situate in London, and various obligations having been incurred within the jurisdiction of the metropolitan courts, the Council have commenced their actions by summoning to those courts such of their members in and about London as are more than two years in arrear of their subscription, and who are known, or are found on enquiry, to be in circumstances to justify, in their cases, the full enforcement of the claims in question. The summonses having been issued, the parties, on receiving them, have, with a single exception, declined offering any further opposition to the legal claim thus made upon them on the part of the Society, and have paid into court the whole amount of arrears, as well as the costs incurred. In the single case referred to, the summons was not answered by the defendant's either discharging the claim or making his appearance, and the action accordingly took its course; when His Honour the Judge of the Westminster County Court, in which the case came on, having heard the grounds on which the action was brought, as well as the evidence adduced of due election and membership, and having ascertained the powers of the Society conferred upon it by its charter, at once decided on the validity of the Society's claim, and made a formal order of court, that the amount of arrears claimed, with the accumulated costs incurred, should be paid by the defendant on or before that day week. When the Council shall have thus cleared off the London list of arrears they will feel it to be equally their duty to proceed in a similar legal manner to summon parties resident in the different counties of the kingdom whom they shall ascertain to be in a condition fully to meet their liabilities, and who by the time of such issuing of summons shall have failed to discharge their just obligations to the Society. The Council, however, having now established the principle on which they have sought to recover these arrears of subscription, and being thus fortified by a judicial decision which leaves no doubt of the validity of the claim of the Society against all its members, trust that the remaining defaulters will no longer evade their obligations, and impose upon the Council the invidious task of enforcing the payment of these arrears in a court of law—a final appeal as painful to the Council to make, as it must be inconvenient and derogatory to the parties in arrear to become subject to. When the arrear list shall have thus been disposed of, the income of the Society will lose its anomalous character, and correspond in actual amount to the payments due from the willing contributors, of which the Society will then consist; and the funds being thus established on a regular basis, the estimated income and expenditure of the Society may at all times be satisfactorily adjusted.

The Council have to report the favourable progress of the preparations for the country meeting of the Society, to be held this year in the city of Exeter, in July, in the week commencing on Monday, the 15th of that month, of which the Thursday will, as usual, be the principal day of the show. In order, however, to meet the wishes of the members and the public, heretofore so often expressed on this subject, that a longer period should be allowed for the due inspection of the live stock by all parties attending the meeting than the single day hitherto devoted to that object, the Council have decided this year to try, as an experiment, the extension of that period to a day and a half—namely, on the Thursday, as formerly, and on the Friday from six o'clock in the morning till noon, when the stock will be at liberty to leave the yard; the result of which experiment will be a guide to the Council in their arrangement for future years. The entries for implements and stock for the Exeter meeting promise to be as numerous as for the previous country meetings of the Society; and the various railway companies have received the application of the Council for concessions in favour of the Society's exhibitors in a spirit no less courteous than in former years, and there is every probability of an extension, on their part, of privileges no less liberal, thus aiding by their powerful co-operation the national objects of the Society. The Council have accepted from Mr. Slaney, M.P., a renewal of his prizes for ploughs to cut out to a certain extent, and to fill in, drains; and from the South Devon Association a schedule of prizes for their local breed of stock, known as the South Hams cattle; all of which prizes will be open to general competition, under the general regulations of the Society. The Council have also accepted the kind offers of Sir Thomas Dyke Acland, Bart., M.P., and Mr. Turner, of Barton, to submit to the members, during the period of the Exeter meeting, the construction and operation of their catch and water-meadows, and to take measures for explaining on the spot, to all such visitors as will favour them with their company on the occasion, the theory and practice of irrigation in Devonshire. Mr. Hamond, of Westacre Hall, in Norfolk, has accepted the new appointment of Steward-elect of Implements at the Exeter meeting, agreeably with the arrangement adopted for the first time this year, by which an opportunity will be afforded to the junior steward of implements to qualify himself for the duties and details of that department; and Mr. Jonas, of Ickleton, in Cambridgeshire, has accepted the appointment of a steward of cattle, at the country meetings of the Society, in the place of Mr. Kinder, who, after a long period of valuable services to the Society, retires this year by rotation from that office. The Council have again resorted to the same mode of appointing the judges for implements and stock as that of last year—namely, by requesting the members at large of the Society to favour them, at or before the present general meeting, with the names of parties proposed by them as judges, and on whose behalf each proposer shall be ready to certify, on his own personal knowledge, that they are in every respect qualified and willing to act as judges in the particular classes for which they may be respectively recommended, and that they are unconnected with any exhibitor of stock or maker of implements, and have no direct personal interest in the stock exhibited, as breeders of any of the animals upon which they may be called upon to adjudicate; and by referring these nominations to special committees, who will select and recommend to the Council the most fit persons, in their opinion, to fill respectively the office of judge in the particular departments and classes of the Show. The Council, however, feeling, as they do deeply, how much the character of the Society, and the value of its prizes, depend on the talent, experience, and integrity of the judges by whom the awards are made, and from whose decision there is no appeal, are fully sensible of the imperfection attendant on all the modes hitherto adopted for their nomination, selection, and appointment; and they are accordingly most anxious to receive and adopt any means that may be suggested to them, by which every just cause of suspicion and complaint, on the part of the exhibitors, may be obviated for the future. The remote position of the Western District, and the strong desire to receive and profit by the means of agricultural improvement with which the presence of the Society has hitherto been accompanied; the direct communication by railway, from every part of the kingdom, to its different chief towns, and by sea to convenient ports on its northern and southern coasts; the varied agricultural character of the south-western counties, of which that district is comprised; and the peculiar attractions offered to general visitors by the county of Devon alone, in which the meeting will be held; are circumstances that will no doubt conspire, with the especial and more immediate objects of the occasion, in drawing together, in the city of Exeter, a very large and interesting meeting. The parties composing this numerous assemblage, by their personal communication and interchange of sentiment on topics of practical agriculture, will be enabled to promote among themselves a spirit of inquiry by mutual comparison of local systems and their results, and at the close of the meeting will carry back to their different neighbouring or distant residences throughout the country, that conviction of the necessity of the strictest economy of time and means, in every department of husbandry, which will lead to the adoption of modes of management by which the most effective results may, in every case, be obtained at the least expenditure of time and money: a mutual conference on topics of deep practical interest to the agricultural community, which it has been one of the great objects of the Society to recommend and promote, through the medium of its country meetings.

The Council have accepted the invitation of the royal commission for the exhibition of the works of industry of all nations in 1851, to hold a show of cattle in Hyde Park in that year; but finding that the royal commission have included in the arrangements for their own exhibition a department for agricultural implements, the Council, with a view of not interfering with this department of the royal exhibition, have resolved to omit the implement portion of the Society's show in 1851, and to confine their exertions entirely to their show of cattle, as invited by the royal commission, and to take every means to render that show interesting as an exhibition of breeding stock. In order to meet this new arrangement for the year 1851, the Council have re-adjusted accordingly their districts for the country meetings of the ensuing four years, and have agreed to the following rotation:—

1851, Middlesex District, consisting of the county of Middlesex.
1852, South-Eastern District, comprising the counties of Kent, Surrey, and Sussex.
1853, South-Wales District, comprising the whole of South Wales, with the addition of the counties of Gloucester, Hereford, Monmouth, and Worcester.
1854, East-Midland District, comprising the counties of Leicester, Lincoln, Nottingham, and Rutland.

The Council trust that, as so large a portion of the country members of the Society, from every part of the kingdom, will probably visit London next year, the circumstance of the Society's show of cattle being held in Hyde-park will meet the wishes of a great majority of its body, and promote the general objects of the whole; while the postponement of the Society's accustomed country show for one year, in the pre-arranged rotation of districts, will prevent any failure that might probably occur in holding it at a time when another exhibition will be drawing public attention, in an especial manner, to the metropolis.

The Council have received from the Chemical Committee the annual report of Professor Way, the Consulting Chemist to the Society, on the satisfactory progress of the chemical investigations in his laboratory, of which the results will be published in the Society's Journal; and on the great increase, within the last quarter, of chemical analyses required for agricultural purposes by members of the Society. The Council have adopted, on the recommendation of that Committee, the following subjects for investigation during the ensuing 12 months:

1. The continuation of the investigation into the absorptive properties of soils, including clays.
2. The nutritive properties of the Grasses.
3. The agricultural properties of the chalks and marls.
4. The chemical properties of water, with a view to its effects on irrigation, and on the health of animals.

The members have already been favoured by Prof. Way with three very interesting lectures during the present year: the first, on Guano, and on that extensive adulteration at present prevailing in it, which entails so great a disappointment and pecuniary loss on the farmer who purchases the spurious article; the second, on the absorptive powers of soil in reference to manure, when a new faculty in certain soils was experimentally elucidated, by which manuring matter is arrested by them from liquids, and retained in intimate combination until required as food for plants; the third, on butter and cheese-making. In consequence of the great interest excited by Prof. Way's second lecture, he kindly consented to repeat its delivery, previously to laying before the Journal Committee the full details connected with the history of the important discovery to which it had reference, and the experimental researches by which the truth of that discovery has been extended and confirmed.

The Council have been honoured by his Royal Highness Prince Albert with communications on the result of an attempt to naturalise a hardy and prolific race of sheep from Thibet at her Majesty's farm at Osborn; and on a plan for turning the sewage of towns into a source of national wealth by its application to the purposes of agriculture. They have also been favoured by the Earl Grey, H.M.'s Principal Secretary of State for the Colonial Department, with a communication on asphaltic manure from Vice-Admiral the Earl of Dundonald, Commander of H.M.'s Naval Forces on the West Indian Station.

The Council, in conclusion, beg to remind the members of the Society of their privilege to attend the weekly meetings of the Council; the first Wednesday, however, of the month being excepted, when only the legislative business of the Society is under consideration, and the admission is consequently confined to members of Council and Governors. At the weekly meetings discussions take place on the communication of personal experience on topics of practical interest in agriculture; and on those occasions the presence and co-operation of the members generally of the Society are at all times desired and esteemed as a favour by the Council.

By order of the Council, JAMES HUDSON, Secretary.

On the motion of Sir Hugh Richard Hoare, Bart., seconded by Mr. Barugh Almack, this report was unanimously adopted by the meeting.

The Marquis of Downshire, the President, then took the chair, when Colonel Challoner, chairman of the Finance Committee, proceeded to lay before the meeting the report of the Auditors, and to make a few remarks on the state of the arrears of subscription, and the means of recovering them, agreeably with the special orders of the Council. He took that opportunity of referring to the satisfactory arrangements of the documents of the Society, placed by the Bye-laws under the charge and custody of the Secretary, by which every portion of the correspondence could at once be produced which had taken place at any time with members against whom actions were brought in the County Courts, and all other documentary evidence required in court to establish the due election and membership of any defaulter under those circumstances. The advantage of this arrange-

ment and ready production of papers had already proved of high value in each case, and led to the payments of arrears claimed. After the decision in the Westminster County Court, he thought there would now be no doubt of the Society's claims, or of the necessity of the Council enforcing them.

On the motion of Colonel Challoner, seconded by Mr. Thomas Rowlandson, the best thanks of the meeting were voted unanimously to the auditors, for their care in auditing the Society's accounts. Mr. Knight returned thanks. He had the satisfaction of informing the members that the accounts of the Society were so admirably kept, that there was not the slightest trouble in comprehending or examining them; on the contrary, that the auditors found it a pleasing task to audit them.

On the motion of Mr. Raymond Barker, seconded by Mr. Fisher Hobbs, a vote of thanks was passed to Prof. Way, for the kind manner in which he had taken the trouble of delivering three valuable lectures to the members during the present year. Mr. Barker having expressed his sense of the great scientific value of those lectures, and Mr. Fisher Hobbs having borne his testimony to their great practical utility, the noble President put the question from the chair, with his special amendment that the thanks offered should be "cordial" ones, and the motion was carried unanimously.—Prof. Way returned thanks; expressing the gratification that it gave him to find that his application of science to the purposes of agriculture were approved by the practical farmers of the country, of which on that occasion Mr. Fisher Hobbs might be regarded as the representative. It would always give him pleasure, whether officially connected or not with the Society, to aid in the advancement of the great art they were that day met together to support.

On the motion of Lord Camoys, seconded by Sir Richard P. Joddrell, Bart., the thanks of the meeting were voted unanimously to the President. The Marquis of Downshire acknowledged the compliment paid to him, and expressed the warm interest he felt in promoting the great objects of the Society, although distant engagements so frequently prevented his due attendance at its meetings. His lordship took that opportunity of stating to the members the result of his trials of azotised manure, and the great success attending its application.

Miscellaneous.

Rapid Butter-making.— The new American churn, patented in England, which was exhibited at the Mansion-house on Easter Monday, was again shown, a few days since, at the Ship Tavern, Water-lane, Tower-street, in presence of several gentlemen connected with the butter trade, and Dr. Ryan, of the Polytechnic Institution, when from four quarts of cream and two quarts of London sweet milk it produced 5 lbs. of butter of excellent quality and flavour. The result elicited unqualified approbation from the gentlemen present.

On the Growth of Oats.—Knowing that before grain ripens, much of its nutritive power remains in the stem, and having this unpropitious climate to deal with, it occurred to me that, if Oats were cut and made into hay some six weeks before the ripening of the grain, I should have a valuable product, avoid the risks of a late harvest, get the crop off the land in time to sow a second, or stolen crop, and last, but not least, make a larger money return from my Oat crop than if I allowed the grain to ripen. I therefore cut a certain acreage of Oats before any part of the straw ceased to be green and succulent; it was made into hay, not as hay is generally made, by exposing it to the bleaching and destructive action of sun and rain, but by putting it up into small stooks, as is done when the grain is ripe. It thus dried without exposure. This Oat-hay was (of course not threshed) given in the winter to sheep, cattle, and horses, and put in their racks side by side with the best Clover-hay. The animals invariably preferred it to the Clover-hay, leaving that untouched; they throve well upon the Oat-hay; and its high nutritive power is confirmed by chemical analysis. I carefully weighed from the same field a like acreage of ripened Oats and its straw, and the money produce of both kinds is as follows per Scotch acre:

An acre of ripened Oats gave 36 bushels of Oats, present value, say 2*s.* per bushel	£3	12	0
150 stones of straw, at 24 lbs. to the stone, 3*d.* ...	1	17	6
	5	9	6
Deduct cost of threshing	0	7	0
Net value of the acre	£5	2	6
An acre of unripe Oats gave 205 stone of hay, at 24lbs. to the stone, worth more than hay, which is sold here at 10*d.* per stone; say 205 stones, at 10*d.*	8	10	10

This leaves an increased product of 3*l.* 8*s.* 4*d.* over that of the ripened Oats; in addition to which I saved all the risk of a bad harvest, and cleared the ground in good time to put in a second crop. To those who wish to try this plan, I would recommend winter Vetches for the stolen or second crop, as I have proved they stand our winters without injury. *Martyn W. Roberts, Torlundy, Fort William, N.B., April* 17, 1850, *in Farmer's Herald.*

Education of Agricultural Labourers.—Now, on this point, I have no hesitation in speaking out, on the knowledge of cases that have come within my observation, as to the character and conduct of those who have left the school here, which has now been open nearly eight years; many who had been at shool for some time have now left, and are gone to different employments; some as domestic servants, and others in the usual employments of agricultural life; some as apprentices to trades; and I can affirm most conscientiously, that those who have remained longest in school, make the best servants, remain longest in their places, show more of personal respect to their superiors, have a feeling for greater physical comforts, and are in every social relation better and happier by the education which they have received. *Rev. R. Dawes, in his Remarks on the Educational Plans of the Committee of Council on Education.*

Calendar of Operations.

MAY.

SUSSEX FARM, *May* 20.—Wheat, on wet clay soils, looks yellow and sickly, but on dry land it looks tolerably well; Oats also begin to look rather blue; Barley looks more healthy, but is partly destroyed by the wireworm. The seeds intended to be cut for hay have the appearance of an average crop; the Potatoes come up regular, and as yet no appearance of being injured by the late frosts. The Hop bines grow slowly, but there are no signs of any damage being done as yet; a few fine days of sunshine would put everything a-going again. We have commenced to-day, as we have part of the ground ready to drill, dung, and sow Swedes, and, if time, we shall be engaged preparing the land and sowing for some time. The kinds we sow are principally Skirving's and purple-top, with a few of green-top and Laing's Swedes when too wet to sow Turnips. We shall plough Grass land, and sow Rape for autumn seeds for the sheep. Men are engaged turning up dung in the cattle yards, filling and spreading dung for the Swedes, hoeing Potatoes and Beans, and chopping and loosening earth round the Hop hills. Women are engaged hoeing Beans and Potatoes and pulling Thistles and Docks out of Wheat. *J. B.*

Notices to Correspondents.

CHICORY: *J C W.* On deeply cultivated, well-tilled and manured and clean land of somewhat clayey nature, sow now 4 lbs. of seed per acre in shallow rows 12 inches apart. They will be up towards the end of June, and must be singled out 8 inches apart, and hoed clean at intervals during the summer, and taken up in November.

CORN LAWS: *J B., J N.* The article on this subject must be declined: with thanks.

GRASS SEEDS: *An Old Sub.* Your question cannot have reached us, unless it is that answered to "G. A.," at page 286.

HYBRID GUINEA-FOWL: *Sylvanus.* There are such things as hybrids between the guinea-fowl and the domestic fowl, but they are extremely rare. Two such were lately living, and may still be alive, in the possession of the London Zoological Society, in the Regent's-park; and an account of two others, bred in America, that were surviving at the time the report was made, is given in the "Annals of Natural History," vol. xix., p. 210, by Dr. S. G. Morton. They have all proved barren monsters, of uncertain sex, with the male characters predominating. On what evidence does the friend of "Sylvanus" believe that his chickens are similar hybrids? Please let him describe them. They would be greatly valued by supporters of the "Vastigiarian" theory, who would rely much on the *possibility* of such crosses founding a new race, and on whose minds the long-recorded list of sterile mules seems to make no impression. *D.*

MANURE: *J B F.* Two cwt. of superphosphates mixed with two cwt. of guano will be an admirable manure for an acre of Swedes. "Hillyard on Practical Farming and Grazing" is a good book on the subject you name.

NETTING: *M A.* We have used the tar-twine netting, costing about 4*d.* per yard. The labour of shifting is much less than hurdles. They will last two years, and with mending, a third. Cocoa-nut fibre is spoken well of. We do not know it.

Markets.

COVENT GARDEN, MAY 25.

Vegetables are well supplied. Strawberries and Hothouse Grapes are both more plentiful, and the same may be said of Pine-apples. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 6d. to 2s. 6d. a bunch; some green Peas of good quality have been supplied from Cornwall and France. Frame Potatoes fetch from 1s. to 2s. per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Bignonia venusta, Primulas, Cinerarias, Azaleas, Lily of the Valley, Epacrises, Acacias, Lilacs, Pinks, Carnations, and Roses.

Spinach p. sieve, 9d	

POTATOES.—SOUTHWARK, May 20.

The Committee report that the market is very moderately supplied with good English Potatoes, consequently high prices are obtained for anything that is of good quality. Foreign Potatoes are rather short, but are not selling at much advance. The following are this day's quotations:—York Regents, 120s. to 140s. per ton; Scotch cups, 65s. to 75s.; ditto whites, 45s. to 50s.; French whites, 40s. to 70s.; Rhenish do., 50s. to 70s.; Belgian do., 50s. to 65s.; Dutch, 40s. to 50s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, MONDAY, May 20.

The supply of Beasts is large and quality good. As usual on Whit Monday the demand is small, consequently lower prices are submitted to. There is a considerable increase in the supply of Sheep and Lambs, which causes a dull trade for them. Sheep in the wool are now quite out of season, we therefore cease to quote them. Good Calves are freely sold at 4*s.*; but second-rate meet with a dull sale. From Germany and Holland there are 238 Beasts, 650 Sheep, and 96 Calves; from Spain, 120 Sheep; from Scotland, 500 Beasts; and 2200 from Norfolk and Suffolk.

					Pigs	... ...	3	0 — 4	0

Beasts, 3571; Sheep and Lambs, 26,230; Calves, 176; Pigs, 388.

FRIDAY, May 24.

The supply of Beasts is smaller, but quite adequate to the demand; no higher prices can be quoted. We have also a less number of Sheep, but only in very few instances is more money obtained. Lambs are still plentiful; however, trade is more cheerful for choice ones, but middling quality are very unsaleable. Good Calves are readily sold at an advance of about 2d. per 8 lbs. From Holland and Germany there are 6 Beasts, 710 Sheep, and 108 Calves; from Scotland, 240 Beasts; and 116 Milch Cows from the home counties.

COAL MARKET.—FRIDAY, May 24.

Buddle's West Hartley, 13s.; Tanfield Moor, 13s.; Wallsend Braddyll's Hetton, 15s. 3d.; Wallsend Haswell, 16s. 6d.; Wallsend Lambton, 15s. 9d.; Wallsend Tees, 16s.

HOPS.—FRIDAY, May 24.

Messrs. PATTENDEN and SMITH report that the market continues very firm. It is reported that the bine continues to progress, but is still backward and uneven. Very little doing on the duty, which is still estimated at 150,000*l.*

MARK LANE.

MONDAY, MAY 20.—The supply of English Wheat by land carriage samples to this morning's market was moderate; nevertheless, it was necessary to submit to a decline of 1s. per qr. upon the prices of this day se'nnight, before any progress could be made in selling. Foreign is held nominally at the rates of last week, but a similar reduction would in many instances have been accepted to have effected sales.—Our quotations for Barley, Beans, and Peas, are fully supported.—Oats are a slow sale, but not cheaper.—The Flour trade is heavy.

FRIDAY, MAY 24.—There has been a fair arrival of foreign Oats during the week, but the supplies of all other grain are moderate. This morning's market was thinly attended, and business in all descriptions of corn was very restricted. Wheat was held at the nominal prices of Monday last, but to have forced sales some reduction must have been submitted to.—Barley, Beans, and Peas are unaltered in value.—The Oat trade is heavy, and late rates barely supported for inferior samples.—French Flour is a slow sale, and 1s. per sack cheaper.—Floating cargoes of Galatz corn arrived on the coast would fetch 33s. to 34s., cost, freight, and insurance.—During this week the temperature has been higher, with a varying wind and warm showers, which have forced vegetation and improved the appearance of the country.

LIVERPOOL, FRIDAY, MAY 24.—The receipts into this port, coastwise and from Ireland, since Monday last are still very small, and beyond 7000 qrs. of foreign Wheat, the arrivals from abroad are only moderate. At our market this morning a decided feeling of indifference almost generally prevailed. All descriptions of Wheat were excessively dull of sale, and indiscriminately depressed in value 1d. to 2d. per 70 lbs. from our last quotations. Barley, Beans, and Peas commanded less attention, and were rather cheaper. Oats, of which scarcely any remain here, advanced ½d. per 70 lbs.

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith, in consequence of the premises being required by the London and Birmingham West-India Dock Junction Railway Company, to sell by Auction, on the premises, Dalston, Middlesex, on MONDAY, May 27, and following day, at 12 o'clock each day, the valuable GREENHOUSE PLANTS, consisting of choice Azalea indica, Erica, Epacris, Boronia, Burchellias, Diosma, Pimelea, Erythrina, Kennedya, Metrosideros, Fabiana, Geraniums, Fuchsias, Verbenas, Chrysanthemums, Lobelias, Calceolarias, Heliotropes, Cupheas, Myrtles, Hydrangea, Alstrœmerias, Cactus, Gardenias, Clianthus, Dahlias, Clematis, Jasmine, Aloes, Brooms, Roses, Magnolia grandiflora, &c.—May be viewed two days prior to the sale. Catalogues had (6*d*. each, returnable to purchasers) on the premises, at the Shop in Covent-garden, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BROOK-STREET, UPPER CLAPTON.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Mr. Batten's Nursery, Brook-street, Upper Clapton, on THURSDAY, May 30, at 3 for 4 o'clock, precisely, a rich bed of TULIPS, about 120 rows, the property of an Amateur.—May be viewed prior to the sale. Catalogues had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, May 29th; THURSDAY, 30th; and FRIDAY, 31st, about 1000 first-rate DAHLIAS; also the newest varieties of Fuchsias, Verbenas, Geraniums, Heartsease, Climbing Roses, plants in bloom, and a variety of bedding plants.—May be viewed the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. BATEMAN'S CELEBRATED COLLECTION OF ORCHIDS.—The Committee for providing a Church, Parsonage, and Schools in the wild, populous, and neglected district of Biddulph Moor, are happy to inform the growers of Orchidaceous Plants, that Mr. Bateman, in promotion of this important object, has generously placed at their disposal about 400 of his SPECIMEN PLANTS, among which will be found nearly all the rarest and most beautiful species at present in cultivation. These will be submitted for unreserved sale by Mr. STEVENS, at his Great Room, King-street, Covent-garden, on TUESDAY, the 11th day of June, on the morning of which day they will be on view. Catalogues are preparing, and will be ready in a few days, when they may be had on application to the Auctioneer, or from either of the Secretaries, who will be happy to give any additional information respecting the projected Church, &c.

Rev. EDWARD WILSON, Buglawton, near Congleton.
Rev. JOHN SUTCLIFFE, Oatlands, ditto.
May 25th. Hon. Secretaries

MR. ALEXANDER will Sell by Auction, on the premises, North-street, Poplar, on TUESDAY, May 28, at 12 o'clock, a choice Collection of TULIPS, the property of Mr. DARK, who is declining their cultivation, comprising Lady Stanley, Louis XVI., Brulante Eclatante (Betrel), Strong's King, Camuse de Craix, Thalia, Brown's Ulysses, Duke of Devonshire, Jeffery's Rose Elizabeth, Lila's Grand Vase, Sharpe's Victoria, Midway new, Eclipse new, Don Cossack (Biz. ex. ex.), Dangerous new, Samson, Water Witch, &c.; also many new broke flowers only in this collection, together with the stage, with cloth, patent pulleys, rollers, &c. May be viewed two days prior to sale; Catalogues had on the premises, the "City of Canton," Poplar, "White Swan," West Ham, and of the Auctioneer, Shacklewell, near London.

THE ERECTIONS OF THREE GREENHOUSES, GREENHOUSE PLANTS, &c.

MR. D. A. RAMSAY will sell by Auction, on the premises, King's-rd., Chelsea, opposite Cremorne Gardens, on TUESDAY, May 28, at 2 o'clock precisely, by order of Messrs Dennis (the lease of the Premises being expired), 3000 GREENHOUSE PLANTS, comprising Camellias, Geraniums, &c., finely in bloom. Also a quantity of Plants for Bedding out, consisting of Geraniums, Verbenas, Petunias, &c., in choice variety. With other Miscellaneous Nursery Stock. May be viewed one day prior to the sale. Catalogues had at the usual Seed Shops, on the Premises, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

STOVE CLIMBERS, GERANIUMS, FUCHSIAS, DAHLIAS, AND BEDDING PLANTS GENERALLY.

MR. HASLAM will sell as above, at the Auction Mart, on FRIDAY, May 31.—Catalogues to be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping.

WATER-CRESSES.

TO BE LET, half an acre of recently-planted WATER-CRESSES (Spring Water), capable of being increased to an acre or more, within 8 miles of London, near two lines of Railway. The Advertiser would not object to engage an industrious Man on weekly wages and a share in the profits, to one who understood the growing of Water-cresses.—Address or apply to Mr. WILSON, 24, Conduit-st., Regent-st., London.

TO MARKET GARDENERS.

TO BE LET ON LEASE, with immediate possession, a desirable MARKET GARDEN, situate at Turnham-green, near the high road, containing upwards of 16 Acres, with good House and Offices. To a tenant of undoubted responsibility, the extensive and valuable stock of Trees, Shrubs, and Bushes will be included in the Letting, and Scheduled in the Lease.—Apply to Mr. W. S. PATERSON, Solicitor, 7, Bouverie-street, Fleet-street, London.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

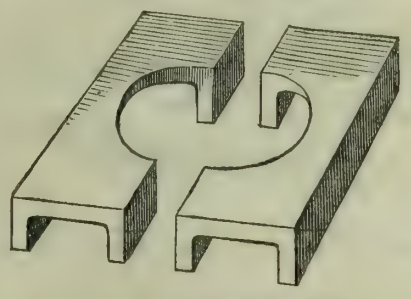
The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d*. per foot. Small ditto, 10*s*. 6*d*. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.



Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

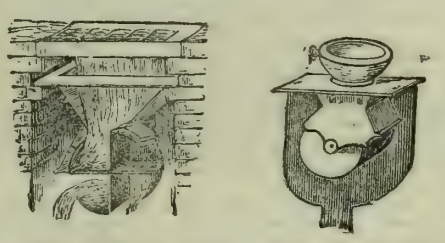
GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d*. to 3*d*. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

IMPORTANT TO HORTICULTURISTS. — The great number of inquiries for a description of the REGISTERED STRAWBERRY and MELON TILES, renders it impossible for the inventor to answer each application separately, and he therefore now introduces a wood engraving of two of them, forming a pair, which he hopes will suffice to give an idea of their construction and mode of using them.

TWO STRAWBERRY TILES FORMING A PAIR.



These Tiles are now being extensively used, and have been highly approved of by some of the highest standing in the Horticultural world—in confirmation of which the reader is referred to the published testimonial which appeared in the 1st page of this Paper of last week. An illustrated Pamphlet, with further particulars, can be had, on sending three postage stamps to the inventor, Mr. JOHN ROBERTS, 34, Eastcheap, City, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, King's Road, Chelsea, near the Bridge.

NOTICE.

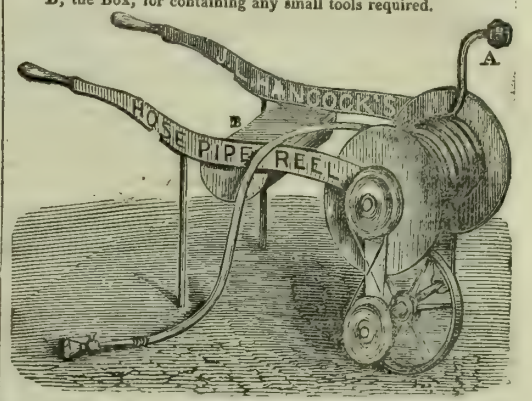
ANTHONY'S PATENT AMERICAN CHURN.—COPY.—The first experiment with the New American Churn and the Old Suffolk Churn at Benacre Hall Farm, 10th May, 1850. From 13 quarts of Cream by the American Churn produced 11 lbs. 3 oz. of Butter in 12 minutes. From 18 quarts of Cream by the Old Suffolk Churn, produced 13½ lbs. of Butter in 30 minutes, being 1 oz. of Butter more to each quart of Cream of the same quality in favour of the American Churn.—CHRISTOPHER SMITH, Bailiff to Sir Thomas Gooch, Bart.

Apply to Messrs. KEY and MITCHELL'S Depôt for Patented and other new and useful Inventions, 97, Newgate-street; and Branch Establishment, 229, Blackfriars-road.

Parties infringing rigorously prosecuted.

DR S. NEWINGTON'S HAND-DRILL HOES, with their various fittings. With these Hoes a man or lad can hoe from two to three acres of Wheat, Beans, &c., daily, the tines being made with movable shares and adapted either for stirring or hoeing. Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles for all corn, Mangold, Carrots, Turnips, &c. Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs DUFAUR and Co., Agricultural Depôt, 21, Red-lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

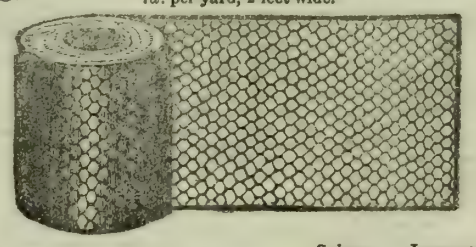
FLEXIBLE INDIA-RUBBER HOSE PIPES.



JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING. These Pipes are well adapted for watering Gardens, conveying Liquid Manure, for Breweries, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required. Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently flexible in all temperatures, and are therefore particularly suitable for Fire-Engines; and from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes. Being extremely portable, stowing closely without danger of injury, resisting the influence of climate, insects, and vermin, frequently so injurious to such articles on board ship, and retaining their virtues though long out of use, render them particularly adapted for exportation.

N.B.—VULCANISED INDIA-RUBBER GARDEN HOSE, fitted with Roses, Jets, and Branches, complete, with Union Joints, ready to attach to Water Cisterns.

All letters or Orders addressed to J. L. H. at the Manufactory and Warehouse, Goswell-mews, Goswell-road, London, will meet with immediate attention.



A, represents the Union-joint, for effecting the communication between the Hose-reel and the Tank, or Reservoir.

B, the Box, for containing any small tools required.

J. L. HANCOCK invites attention of parties using long lengths of the Flexible Garden Hose, to his SELF-ACTING HOSE PIPE REEL, which is found a most convenient machine for winding up and conveying away the Hose when out of use.

GALVANISED WIRE GAME NETTING.—7*d*. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d*. per yd.	5*d*. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong "	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d*. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CHEAP AND EFFECTIVE FENCE AGAINST HARES AND RABBITS.—Iron Wire Netting of various patterns, to exclude the smallest Rabbits, in coils of 50, 100, or any given number of yards, at prices varying from 4*d*. to 1*s*. per yard run. Aviary Net at proportionate prices. None sent out without at least two coats of the best Anti-corrosive Paint. Testimonials of the highest and most respectable character, received during the last 13 years, enable the Advertiser to speak with confidence as to the excellence of the article.—Apply to Mr. SAMUEL TAYLOR, Barnwood, near Gloucester; or to ROBERT WOODCOCK, at the Manufactory, Stoke Ferry, Norfolk.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs, EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

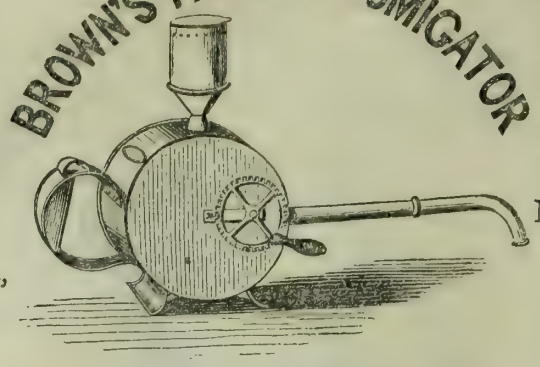
PRICE TEN SHILLINGS

AND UPWARDS.

A PORTABLE INSTRUMENT

FOR

FUMIGATING GREENHOUSES,



STOVES, AND FRAMES,

OR

SHRUBS AND FLOWERS, IN THE OPEN AIR,

Without injuring the most delicate plant;

BROWN'S PATENT FUMIGATOR

DELIVERING THE SMOKE COOL, IN A DENSE MASS,

And effecting a great saving of Tobacco.

MANUFACTURED AND SUPPLIED TO THE TRADE BY

MESSRS BARBER AND GROOM,

LONDON;

AND MAY BE HAD OF ALL

Ironmongers, Seedsmen, and Florists.

The Instrument is also available for Fumigating Apiaries; or Houses and Ships during the prevalence of Cholera or other epidemic Diseases, or when infested by Insects; with it, also Rooms and Closets may be scented by burning Lavender or other aromatic Herbs. It is of most easy application, the substance to be used for fumigation being placed in the magazine at top, and ignited with a match or paper, in precisely the same manner as an ordinary smoking pipe; it is so light that it can be carried about and used by a lady without inconvenience. All that is necessary is to introduce the nozzle into an aperture in the door of a Greenhouse, and by turning the handle it will soon be filled with smoke; nor is the machine less effective in the open air for the smoke being concentrated to a point, and made to issue in any required direction, the whole force of the instrument can be brought to bear on any particularly affected part. A great deal of Tobacco may be saved by placing the Plant under a paper tent, or some other temporary covering, during the operation.

TESTIMONIALS.

GARDENERS' CHRONICLE, Edited by DR. LINDLEY.—"Within the last few days I have given this invention a fair trial. The principles upon which it acts are admirable, causing a most complete, and hence economical, combustion of the most essential portions of the tobacco, and emitting a dense column of smoke in a perfectly cool state, so that all fear of scorching is avoided. To those who think of obtaining a machine, I would recommend the larger sizes, being more efficient for the fumigating of greenhouses and hothouses, or similar erections. *Frank Masters, Exotic Nursery, Canterbury.*—[We believe the praise thus given to Mr. Brown's invention to be perfectly well merited. We repeat that this is a nice, useful, effective machine—much the best we have seen.]"

COUNTRY GENTLEMAN, Edited by MR. GLENNY.—"One of the most economical and simple implements that can be applied to the fumigation of horticultural or other buildings; we have had one in use for a month with the greatest advantage. There is not the least waste, for there is no violence, as there must be with the common fumigating bellows. The tobacco is burned gently, and goes away entirely in smoke without heat, and we have had nothing equal to it for partial application to a single infected plant. It is available out of doors as well as in doors, and will be found one of the most useful instruments ever invented for the plantsman who is careful of his specimens."

GARDENERS' AND FARMERS' JOURNAL, Edited by MR. DICKSON.—"Tobacco smoke, since the very earliest of our recollection, has been to us the most intolerable thing, and many others equally and cordially detest it. Any invention, therefore, to obviate the necessity of exposure to its fumes on the part of those who are compelled to use it in the ordinary operations of gardening, would doubtlessly receive and welcome such an invention. We have therefore much pleasure in pointing to Mr. BROWN'S FUMIGATOR—a neat, portable machine, worked with a handle and wheels, by which air is supplied, and the smoke driven through a tube, the end of which may be pointed through a hole in the back or front of a garden frame, through which the smoke would pass without annoyance or inconvenience to the operator; or the machine might be carried in the hand, and the tube directed to the plants or parts of plants affected, and without applying it to the entire atmosphere of a house or frame. Amateurs, who manage their own plants, will find this to be one of their indispensable implements."

FLORIST AND GARDENER, Edited by MR. BECK.—"We have had one of these for some time, and are much obliged by the inventor's courtesy, as it has enabled us to test its merits in our houses. Every one knows the misery endured in fumigating plant-structures; how the operator has to enter with a handkerchief tied over his mouth and nose, and to stop there in a state of suffocation whilst with a pair of bellows he creates smoke enough from a quantity of burning tobacco to destroy the green-fly. Some gardeners cannot sleep the whole night afterwards; and amateurs cannot, or will not, undertake so disagreeable a task. With the instrument we are noticing, it only requires that the upper receptacle be filled with tobacco; place on that a piece of lighted paper, introduce the end of the tube into the greenhouse; and then, gently turning the handle, the whole of the smoke created in the combustion of the tobacco will be sent into the house in a state quite innocuous to the plants, but entirely destructive to the green-fly. It is a great improvement upon any contrivance for effecting the same object, and must command success."

COTTAGE GARDENER, Edited by MR. JOHNSTON.—"If a very small quantity of tobacco be put into the circular vase at the top, and a piece of lighted paper upon the tobacco, the spout then be introduced through a slightly raised sash of the house, and the handle of the fumigator slowly turned, there will be such a continued and copious flow of smoke that the house, though a large one, will be filled in very few minutes. It is the rapid and continuous production of smoke which renders this really an economical instrument, for it is quite certain that by its use less than half the tobacco is sufficient, compared with that required when its combustion is slower. For ladies, and other amateurs, it possesses this additional recommendation, that they need in no way be incommoded by the smoke: they stand outside the house to be fumigated, and not a whiff of the smoke escapes from the fumigator except that delivered by it into the house. It may be employed equally efficiently for fumigating pot plants, or bushes in borders; these need only be put under a tent, formed by driving a stake into the ground, and throwing a sheet or other covering over it, and the spout of the fumigator introduced beneath will sooner, and, consequently, more efficiently, fill the space with tobacco-smoke than any other mode we know."

MIDLAND FLORIST, Edited by MR. WOOD.—"These things we would buy ourselves, and therefore recommend them.—We have often used a machine for the purpose of destroying insects, which had a perforated tin box (in which was placed the lighted tobacco) screwed on the nozzle. When this was applied, the tobacco-smoke was driven HOT upon the plants, and often injured them. By the very excellent little instrument we now have, this is completely obviated, as the smoke is thrown in a continuous jet, so cool, that the most delicate plant is uninjured."

THE FLORIST'S GUIDE.—"This little machine, which has been recently patented, will be found a very useful implement. It consists of a small circular box, in the inside of which is a fan; on the top of the box, a copper funnel and tube, with grating inside, in which the tobacco is placed. When the tobacco is ignited, the smoke is drawn into the box, and is thence propelled through a second tube either against the plants in the open air, or, through an aperture, into the greenhouse frames or pits. This apparatus connected with a parapetticoat (don't be alarmed, reader, it is only a parasol with a petticoat), will be found excellent for fumigating standard Roses and other plants in the open air. On a large scale the machine will also be useful for large houses."

GARDENERS' HIVE, Edited by MR. NEVILLE.—"We congratulate our readers on the introduction of this important machine. MR. BROWN has succeeded in furnishing the Horticultural and Floricultural part of society with a most valuable instrument (and done what has long been wanting) for the destruction of the green-fly (the common aphis). The powers of this unique garden implement are astonishing, a column of cold tobacco smoke, free from any sparks of fire, is forced through the tube with amazing rapidity, sufficient to fill a large house in a very few seconds; one of the many advantages it possesses is its portability and ease of application; a portion of the tube is made to revolve, by which means the under parts of the foliage of plants can be fumigated with the same facility as the upper, even though they may be trailing on the ground."

JOHN EDWARDS, Esq., F.H.S., Wace Cottage, Holloway.—"Two months' trial of the Fumigator warrants me in asserting that it must supersede all other contrivances, being very superior to anything in use, on account of the ease with which it is applied, and being so effective and economic. I shall make a point of showing it in operation to everyone who visits me."

RICHARD STAINS, Esq., Middlesex-place, London.—"This is a very useful and economical instrument, and far superior to any other fumigator."

Mr. THOMAS INGRAM, Gardener to Her Majesty, Windsor.—"I have delayed writing until I gave the Fumigator a fair trial, and I can testify that it answers admirably, and is a great improvement on the old plan."

Mr. GEORGE WYNESS, Gardener to Her Majesty, Buckingham Palace.—"After giving the Fumigator a fair trial, I approve of it very much, and have no doubt that it will effect a great saving of tobacco."

Mr. JOSEPH PAXTON, Gardener to the Duke of DEVONSHIRE, Chatsworth.—"I have given the Fumigator a fair trial, and I find it most effective for smoking plants. I have no doubt but that it will come into universal use."

Mr. CHARLES TURNER, F.H.S., Royal Nursery, Slough.—"The Fumigator was tried here in the presence of several gardeners of noblemen and gentlemen; the whole of whom pronounced it an admirable invention, and greatly superior to anything of the kind. It is effective, economical, and easily worked. It only requires to be known to be appreciated."

Mr. W. HOLMES, F.H.S., Sudbury Nursery.—"This instrument is calculated for very general use, and will be found highly convenient and economical."

Mr. THOMAS THOMSON, Iver, Buckinghamshire.—"A very useful and economical instrument."

Mr. BRAGG, Star Nursery, Slough.—"Effects the object with certainty and celerity, without raising the temperature materially. The saving of tobacco being very great."

ALEXANDER SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their IMPROVED GRASS CUTTING ROLLING MACHINE for LAWNS, the completeness of which has now been fully proved. The Machine works with perfect ease, producing a beautiful smooth surface, and attended with a saving of labour of 80 per cent.

FROM MR. CHARLES M'INTOSH, CHIEF GARDENER TO HIS GRACE THE DUKE OF BUCCLEUCH, DALKEITH PARK.

"Dalkeith Park, June 26, 1847.

"Gentlemen,—In reply to yours of the 15th inst., it gives me great pleasure to state that your Grass-Cutting Machine has far exceeded my expectation. We have it in constant use, and find that it does its work most completely. As to the saving of time, it is not easy to calculate accurately; but of this I am satisfied, that the expense of the Machine will be saved in one year in all places of similar extent with the grounds here.—I am, gentlemen, your obedient servant,

"Messrs. Shanks and Son." "CHAS. M'INTOSH."

A. S. and SON respectfully solicit the attention of the Farmers, Agriculturists, and others to an improved STRAW or HAY CUTTING MACHINE, which they have recently invented. The cheapness and utility of this improved Machine, combined with superior workmanship and durability, enable the inventors confidently to recommend it, as the most profitable Machine of the kind yet sent out. Further particulars and a list of prices may be had, by applying to the makers or to their Agents. Agents for London, Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; Hertford, Mr. George Folkard, Ironmonger; Liverpool, Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; Manchester, Messrs. Francis and James Dickson and Co., Seedsmen, 106, Deansgate; Wakefield, Mr. Wm. Barratt, Nursery and Seedsman, St. Johns; Chester, Messrs. F. and J. Dickson, Nursery and Seedsmen; Glasgow, Messrs. Charles D. Young, and Co., 32, St. Enoch-square; Edinburgh, Messrs. Charles D. Young and Co., 48, North Bridge; Perth, Messrs. Dickson and Turnbull, Nursery and Seedsmen.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

IRON AND WIRE FENCING,

AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,

252, OXFORD-STREET (NEAR HYDE PARK),

And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of

PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,

Park Entrance, Carriage and Field Gates, Wickets, &c.;

Deer, Sheep, and other Hurdles;

Hare and Rabbit-proof Wire Fencing;

Iron Bedstead Makers to the Board of Ordnance;

And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

GLASGOW SHOW.—The Entry of Short-horn Bulls for the Sweepstakes closes on the 1st of JUNE. All other Stock, Implements, &c., must be entered on or before the 20th of JUNE.

Printed Certificates of Entry may be had on application to the Secretary. JOHN HALL MAXWELL, Secretary.

Edinburgh, 6, Albyn Place, 24th May, 1850.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MAY 25, 1850.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.

The next Meeting will take place on SATURDAY, the 8th June.

The Gates will be open to visitors at One, P.M. Tickets are issued to the orders of Fellows at this Office, price 5*s.* each, or at the Garden in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each.

N.B. No Tickets will be issued in Regent-street on the day of Exhibition. 21, Regent-street.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

EXHIBITION OF PLANTS, FLOWERS, AND FRUIT, on WEDNESDAYS, JUNE 12th and JULY 3d.

Tickets to be obtained at the Gardens, only by orders from Fellows of the Society, price 5*s.* each; or on the days of Exhibition, 7*s.* 6*d.* Each ticket will admit one person on either one of the above-named days, or to the Collection of American Plants, on any one day from the 3d to the 8th of June, both included.

ROSE EXHIBITION.

DISS HORTICULTURAL SOCIETY.—The Townsmen of Diss will offer the following prizes for ROSES at the Meeting of this Society, to be held on THURSDAY, the 4th of July, 1850.

TO NURSERYMEN—OPEN TO ALL ENGLAND.

For 100 named varieties,	1st Prize, a Silver Cup	...	£10	0 0
,, ,,	2d Prize, Money	... ...	3	0 0
For 50 named varieties,	1st Prize, Silver Cup	...	5	0 0

For 12 named varieties,	1st Prize, Money	... ...	1	0 0
,, ,,	2d Prize, Money	... ...	0	10 0
Also to Cottagers, in various Prizes		... ...	3	10 0

The above are in addition to the usual Prizes of the Society. All communications to be addressed to the Rev. C. H. BROWNE, Blo' Norton, East Harling, Norfolk.

AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that his splendid collection of AMERICAN PLANTS is now in full bloom, and may be seen gratis.

The Nursery is near the Farnborough station of the South Western Railway, and three miles from the Blackwater station of the South Eastern Railway.

EXHIBITION OF AMERICAN PLANTS, KNAP HILL, WOKING, SURREY.

HOSEA WATERER begs to announce that the AMERICAN PLANTS at Knap Hill are just coming into bloom, and will continue in perfection during the month of June. As a display of flowers this is perhaps without a rival in this kingdom. May be seen, gratis, any day, except Sunday. The Knap Hill Nursery is within an hour's ride of London, being near the Woking station, South Western Railway, where every train stops, and from whence conveyances may at all times be had. H. WATERER is a principal contributor to the Exhibition in the Botanic Gardens, Regent's Park, orders for seeing which may be obtained on application to Fellows.

Knap Hill Nursery, Woking, Surrey, June 1.

ROSES.

ROBERT WHIBLEY begs to announce that his select collection is now in bloom, occupying one of the ranges of glass upwards of 50 feet long, and invites all admirers to view the same. Also a fine general stock of bedding, and all other plants in great variety, very select, and low in price.

Chester Nursery, Kennington, London.

NORLAND NURSERY, NOTTING-HILL.

W. TOWNSEND has the following Plants on sale: Fuchsia spectabile, 2*s.* 6*d.*; Mitraria coccinea, 2*s.* 6*d*; Dielytra spectabile, from 2*s.* 6*d.*; Cantua pyrifolia, 2*s.* 6*d.*; Tropæolum Smithii, 2*s.* 6*d.*; Rose Noisette pumila alba, 1*s.* Also four new Petunias, viz, Prince of Wales, 3*s.* 6*d*; Enchantress, 3*s.* 6*d.*; Rosea superba, 2*s.* 6*d.*; and Great Britain, 2*s.* 6*d.*, the two former were raised by G. Lennox, Esq., and obtained first-class certificates at the June show (1849) of the Horticultural Society.

W. T. has the entire stock; also a selection of the new (1850) Verbenas, Petunias, Mimulus, Antirrhinums, and Chrysanthemums sent out by Chauviere, Dufoy, and the most eminent growers, at 1*l.* per dozen. The older varieties at 4*s.* per dozen. Catalogues on application.

Remittance from unknown correspondents.

CEDRUS DEODARA SEED from this magnificent hardy tree, recently imported from India, and warranted fresh, may be had till the end of June, when the remainder will be planted. Price 2*s.* 6*d.* per 100, or 20*s.* per 1000 seeds.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

TO THE SUBSCRIBERS TO THE GARDENERS' BENEVOLENT INSTITUTION.

—The case of JOHN SHEPHERD, No. 7 on the List for the next Election, and the Fourth Application, is most respectfully recommended to the Subscribers. Proxies will be received by Mr. GRISSELL, 11, New Palace-yard, Westminster.

ROYAL BOTANIC SOCIETY, Regent's Park.—AWARDS offered for FRUIT at the Exhibitions to be held on WEDNESDAYS June 12th and July 3d, 1850.

CLASS VI.

FA Miscellaneous Collection to include the following kinds: one Pine-apple, one dish of Peaches, one dish of Nectarines, one dish of Cherries, one dish of Grapes. The selection of the several kinds will be left to the option of the Exhibitor. July 3, G.L.S., S.

PINE-APPLES.

FB Collections consisting of not fewer than six fruits, nor more than two of one kind. July 3, L.S.G., S.G.

FC A single fruit of Black Jamaica, Antigua, Enville, or any of the black varieties. S.G., S., S.S.

FD A single fruit of the Providence. S.G., S., S.S.

FE A single fruit of the Ripley Queen. S.G., S., S.S.

FF A single fruit of any one kind not already specified. L.S., S.G., S., S.S.

MELONS.

FG A single fruit of the Green-fleshed varieties. June 12, S.G., S., S.S. July 3, S.S., B.

FH A single fruit of the Scarlet-fleshed varieties. June 12, S.G., S., S.S. July 3, S.S., B.

N.B.—In FG and FH the fruit must be cut.

GRAPES.

FI Collections of three dishes of distinct varieties, any colour. July 3, L.S., S.G., S.

FK Collections of any kind, in quantity not less than 12 lbs., and may be exhibited in the box in which they are sent. July 3, S.G., S.S., C.

FL A single dish of any black variety. S.G., S., S.S.

FM A single dish of any of the white varieties commonly known as Muscats. June 12, S.G., S., S.S.

FN A single dish white, of any other kind not specified above, such as Sweetwater, Muscadine, Chasselas Musqué, &c. June 12, S.G., S., S.S.

FO A single dish of any white variety. July 3, S.G., S., S.S.

FP A single dish of Frontignan White. June 12, S.G., S., S.S.

FQ A single dish of Frontignan Red. June 12, S.G., S., S.S.

FR A single dish of Purple or Red of any kind not already specified. June 12, S.G., S., S.S.

FS A single dish of new Grapes of any colour; if introduced within the last seven years they will be considered new. June 12, L.S., S.G., S., S.S.

FT Vines in pots. July 3, S., S.S.

PEACHES AND NECTARINES.

FU A single dish of Peaches. June 12, S.G., S., S.S.

FV A single dish of Nectarines. June 12, S.G., S., S.S.

FW Collections of four dishes of distinct varieties. July 3, S.G., S., S.S.

FX Collections of two dishes of distinct varieties. July 3, S., S.S.

FY APRICOTS; single dish. July 3, B.

FZ PLUMS; single dish. July 3, B.

GA FIGS; single dish. July 3, B.

GB CHERRIES; single dish. June 12, S.S., B., C. July 3, B.

GC STRAWBERRIES; collections of two dishes of distinct varieties. June 12, S.S., B., C.

GD STRAWBERRIES; collections of four dishes of distinct varieties. July 3, S.S., B.

GE Tropical Fruits produced in the Gardens of Great Britain or Ireland. July 3, G., S.G., S.

NOTE.—A *dish* of fruit is defined thus: Grapes three bunches, Peaches, Nectarines, and Apricots, six fruits. Figs, Plums, Cherries, Strawberries, and other small fruit to be exhibited in quantities forming an ordinary-sized dish. All fruit must be perfectly ripe and sound; and (except Pine apples and Grapes) it must be exhibited in punnets 9 inches in diameter, dressed with the leaves respectively belonging to each kind of fruit.—Punnets will be provided at the Garden.

REGULATIONS.

The following extracts, taken from the Rules annexed to the Schedule of Prizes, must be scrupulously attended to.

4. At half-past 8 o'clock in the morning the gates will be closed, after which no subjects for competition can on any account whatever be received, nor can any further entries be made, notwithstanding that the plants (or fruit) are already in the Garden.

5. Exhibitors are requested to observe that the Judges must proceed at 10 o'clock to examine the merits of the subjects exhibited, by which hour the placing and arranging of all plants, flowers, and fruit must be completed.

6. At 7 o'clock in the evening the exhibitions will close, and the several articles exhibited will then be delivered up to the Exhibitors.

N.B. Persons residing at a distance, and who cannot attend personally, may forward to the care of Mr. MABNOCK, at the Royal Botanic Society, Regent's Park, such fruit as they may wish to exhibit. All such parcels of fruit must be delivered at the Garden by 12 o'clock of the day preceding the 12th of June and 3d of July; the fruit will then be attended to, exhibited, re-packed, and returned, carriage free, or delivered in town, as the owner may direct.

The following is the money value of the Medals offered.

E.G. Extra Gold	£20	S.G. Silver Gilt	£3 0*s.*
L.G. Large Gold	15	S. Silver	2 0
M.G. Medium Gold	10	S.S. Small Silver ...	1 5
G. Gold	7	B. Bronze.....	0 15
L.S.G. Large Silver Gilt...	5	C. Certificate	0 10
L.S. Large Silver	4		

Exhibitors would greatly facilitate the arrangements if they would, as early as possible, inform Mr. MABNOCK, at the Gardens, the probable number of articles which they purpose to contribute.

DAHLIAS—NEW AND CHOICE VARIETIES AT REDUCED PRICES.

WM. DENYER, SEEDSMAN and FLORIST, 82, Grace-church-street (near the Spread Eagle), London, has just published his Annual Descriptive List of DAHLIAS, containing all the new and most approved show varieties. The new varieties, 12*s.* to 18*s.* per doz.; the older kinds, but good sorts, 6*d.* each, or 5*s.* per doz.

Catalogues may be had on application.

Also, GENUINE PERUVIAN GUANO, in packages 1*s.* each, with directions for use, sufficient to make 50 gallons.

N.B. All kinds of Seeds suitable for present sowing, descriptive lists of which may be had.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50 best new sorts		25*s.*
25	ditto	15*s.*
12	ditto	9*s.*

Well established in small pots, or per post free.

Their successful mode of cultivation is published in the *Gardeners' Chronicle* of Saturday, May 18.

THE NEWEST AND MOST BEAUTIFUL PLANTS FOR BEDDING OUT can now be supplied by YOUELL and Co, comprising the most distinct and striking varieties of recent introduction, at 4*s.*, 6*s.*, 9*s.*, and 12*s.* per doz, viz., Fuchsias, Verbenas, Petunias, Antirrhinums, Anagallis, Bouvardias, Calceolarias, Chrysanthemums, Cupheas, Carnations, Geraniums (scarlet and fancy kinds), Heliotropes, Lantanas, Lobelias, Lychnis, Mesembryanthemums, Nemophila maculata, Pansies, Pentstemons, Phloxes, Salvias, Double White Rockets, Zauschneria, &c., of which Catalogues can be had on application.—Royal Nursery, Great Yarmouth.

SPANISH FOWLS' EGGS.—A Gentleman residing near Bath, celebrated for his breed of Spanish Fowls, desires to dispose of a few Eggs at 6*d.* each, or 6*s.* for 13.—Address R. M., Hayward's Library, Bath.

SELECT PLANTS.

BASS AND BROWN are sending out the following CHOICE SELECTIONS, at the annexed low prices, the plants of which are exceedingly strong and fine.

Goods carriage free to London, and extra plants presented with orders of 40*s.* and upwards. Descriptive Catalogues supplied for 4 postage stamps for postage.

The above are all in pots, and are very fine plants.

Remittances requested from unknown correspondents. Post office orders to be made payable to either BASS and BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8 h, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Also first prize at Wolverhampton, May 25, against some fine older specimen varieties; and first-class certificate awarded at the Birmingham and Midland Society on the 20th.

Those in bloom will be exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong b ooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

"THE FLOWER OF THE DAY" IS LEE'S NEW VARIEGATED SCARLET GERANIUM.—The habit of the plant is very vigorous, and the variegation perfectly constant. The foliage is bright green, beautifully margined with silver, with a light horse-shoe, and an occasional pink tinge. The trusses are large, of a light scarlet (the most conspicuous colour), and the general effect it produces is elegant beyond description.

"THE FLOWER OF THE DAY" may be seen in bloom at LEE's Nursery during the present month. On the 1st of August good established plants will be ready for delivery at 10*s.* 6*d.* each, with the usual allowance to the trade when three or more are ordered. Orders will be executed strictly in rotation.—Address, J, and C. LEE, Nursery and Seedsmen, Hammersmith, near London.—June 1.

HALLIMAN'S REGISTERED FRUIT PROTECTOR, PERFECTER, AND PRESERVER.—These Glasses are self-acting Hothouses, to fruit of any sort on the common walls; insects are easily kept out, the richness of the fruit being increased. When the utility of these glasses becomes known to the public, no garden will be without them, where fine wall fruit is desired; they can easily be used. Can be seen in use in many first-rate gardens round London, and are very ornamental to walls. Flint glass, 4 inches, for Peach, &c., at 9*s.* per dozen, 3*l.* 10*s.* per 100; 6 inches, for Grapes, 13*s.* per dozen, 5*l.* per 100. Common Glass will be one-third cheaper when C. H. can have it completed. Printed directions sent with each package.—Sold wholesale to the trade by the sole manufacturer, C. HALLIMAN, 1, Queen's-place, Norland-square, Kensington, London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

HENRY BIERTUMPFEL, MANUFACTURER OF IMPROVED AND PATENT GARDEN SYRINGES, AND ORNAMENTAL ICE MOULDS, 68, Albany-street, Regent's-park, London, respectfully tenders his thanks to Gentlemen, Florists, Nurserymen, &c., for their continued and extending patronage, and ventures to hope that he may still be honoured with their commands. To those who have not at present used his Improved and Patent Garden Syringe, he respectfully solicits a trial, as he can confidently recommend them to be unsurpassed either for durability, cheapness, or utility; and being manufactured of the Imperial White Metal, they never corrode or cause verdigrease, to which the brass ones are liable.

Improved Garden Syringe with two Roses, each 10*s.*; ditto, with return end, each 13*s.*; ditto, with Patent Syringe with three Roses, each 12*s.* A liberal allowance made to the Trade.

H. B. would also take this opportunity of calling attention to his New and Ornamental Ice Moulds, they being a very great improvement upon the old shape. They are used and approved of by some of the first Club Houses in London, and by all the most eminent Confectioners, and are particularly admired for their elegant and unique shape.

N.B. Made in Pints, 1½ Pints, Quarts, and 3 Pints.

TO BE DISPOSED OF, the Wholesale Department of an Old and Highly-respectable London Seed Establishment; any one wishing to embark in the trade, or to add to their own business, will find this an opportunity rarely to be met with.—Apply to Messrs. STUBBY and SIMPSON, 8, Wellington-street, London-bridge.

IMPORTANT TO HORTICULTURISTS.

CAUTION.—Whereas information has been given to Mr. JOHN ROBERTS, of No. 34, Eastcheap, London, that some unprincipled persons have been making and selling his REGISTERED STRAWBERRY TILES, and other Horticultural appliances, which are so deservedly approved and sought after by horticulturists, this is to give Notice, that whoever is discovered or detected in so doing will be prosecuted with the utmost rigour of the law. The penalty for every offence is 30*l.* A Reward of Twenty Pounds will be given for every offender, on proof of the offence, to Mr. CHARLES WELLBORNE, 31, Tooley-street, Southwark, Attorney to the Patentee. A pamphlet, descriptive of the inventions referred to, may be had on forwarding three postage stamps to the Inventor, as above.

HORTICULTURAL TOOLS.

GREEN AND CONSTABLE, 36, King William-street, five doors from London Bridge, have a large assortment of GARDEN TOOLS, containing all the recent inventions, and including Lyndon's Patent Cast Steel Spades, Shovels, and Garden Forks, Lord Vernon's Hoe, Jointed Hothouse Syringes, Transplanting Tools, Registered Garden Labels, Ladies' sets of Gardening implements, Pruning Shears, Knives, &c. Agents for the Vitreous Porcelain Garden Bordering.—36, King William-st., five doors from London Bridge.

NOVELTY, ELEGANCE, AND DURABILITY.

R. RESTELL'S PATENT METALLIC ORNAMENTAL GARDEN LABELS, composed of a combination of metals entirely new, in a variety of different patterns and sizes, are far superior to either zinc or porcelain. These elegant labels are perfectly white and well suited for either Lawns and Conservatories; they require no wire to attach them, but may be rolled round a branch, bent over a flower-stand or pot, or be fixed in the ground perfectly upright. They are calculated to last for 20 years, and may be written upon as freely as paper. If the names are to remain permanently, use ink and a steel pen; if only for the ordinary period, a good lead pencil. The ornamental borders of these labels may be had of any colour upon order, also with numbers, if required. For wine and ale cellars the plain labels will be found very useful.

Prices, varying according to weight, from 1*s.* 6*d.* per dozen. To be had of the principal Seedsmen and Florists, and dealers in horticultural implements, and wholesale at the Manufactory, 35, High-street, Croydon, Surrey.

EXHIBITION OF INDUSTRY, 1851.—The following is the LIST of LOCAL COMMITTEES announced up to this day (May 27) to the Royal Commission, with the number of returns of Subscriptions made by them, and the total amount at present reported by each town.

***Where no sum is put against the Town, it implies that the Local Committee of that town has not yet made its first return.

TO BE SOLD, Two large Greenhouses, about 80 feet by 14 feet, in a good state of preservation. Also two American ALOES, and two ORANGE TREES. To be seen at the corner of Swain's-lane, Highgate Rise. For particulars apply to Mr. G. THOMAS, Camden Station Timber-yard, Camden-town.

HOSE AND UNION JOINTS FOR LIQUID MANURE AND GARDEN PURPOSES.

BURGESS AND KEY, 97, Newgate-street, London, are the Patentees and Sole Manufacturers of the GUTTA PERCHA UNION JOINTS, and of Canvas Hose, lined and coated with Gutta Percha. Prices of Hose, per foot, coated on both sides, 1 inch, 7*d.*; 1½ inch, 9*d.*; 2 inches, 11*d.*; 2½ inches, 1*s.* 1½*d.*; 3 inches, 1*s.* 3½*d.* Gutta Percha Tubing, Sheeting, &c., supplied wholesale and retail. Estimates given.

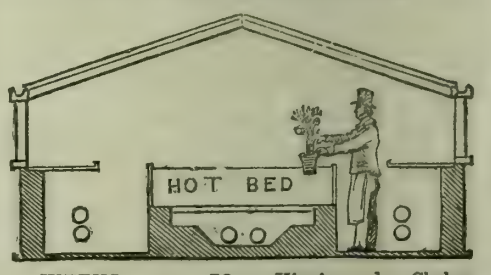
FOR WATERING GARDENS, BREWERS' USE, &c. FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATER-PROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:



Size.	½ in.	⅝ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply	0*s.* 5*d.*	0*s.* 6*d*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

Averuncators	Garden Scrapers	Pick Axes
Axes	Grape Gatherers and Scissors	Potato Forks

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.

MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21*s.* each.—Bagshot Nursery, Surrey.

DIELYTRA SPECTABILIS.

G. CLARKE (late WM. DAWSON) begs to offer the above new and beautiful plant from the north of China, at the reduced price. Small healthy plants, 3*s.* 6*d.* each or 1*l.* 10*s.* per doz.; Flowering plants, 5*s.* to 7*s.* 6*d.* each; Fine specimens for 1*l.*

G. C. has fine healthy grown plants of most of the leading kinds of Ericas, Leschenaultia formosa, Pimelea spectabilis, Boronia serrulata, &c., at moderate prices.

Streatham-place Nursery, Brixton-hill, near London.

RENDLE'S CHEMICAL PLANT MANURE.—We have just received the following letter from Capt. JAMES WILLIAMS, R.N., Newport, near Barnstaple.

"Newport-terrace, Barnstaple, May 14, 1850.

"Sir,—I acknowledge the receipt of another supply of your Chemical Plant Manure, and I have very great pleasure in informing you of the beneficial effects I have found it produce on my plants in general. I am certain a short trial of it will be satisfactory to any person using it. I find my plants *strong and full of flowers*, particularly my Geraniums, which are grown in very small pots, producing now, at this time, *fine trusses of flowers, large*, and *their colours clear*. On my Calceolarias it has an *astonishing effect* in the produce of flowers, both in quantity and size; with regard to Petunias the same. I now use it in the compost of all my greenhouse plants. I have so far been successful in the quantity I have used—one pint of manure to two pecks of compost; and as it is *inexpensive*, I wish you a successful sale, and trust that your customers will be as well satisfied as I am.

"I remain, sir, yours truly, JAMES WILLIAMS."

"P.S. I shall most assuredly recommend all my friends to use it."

Samples can be had gratis, by enclosing six penny postage stamps to pay the postage. Sold in tin canisters, at 1*s.*, 2*s.*, and 3*s.* 6*d.* each, warranted to give satisfaction, or the money will be returned.

Apply to WILLIAM E. RENDLE & Co., Union-road, Plymouth.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DEURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

NETTING, FLAGS, AND BUNTING.—Superior Tanned Garden Netting, for preserving Fruit-trees from Frost, Blight, or Birds; or as a fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from JOHN KING FARLOW'S Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 3*d.* per yard 2 yards wide, or 6*d.* per yard 4 yards wide. Woollen Bunting, any length or width, at 6*d.* per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

SUPERB SEEDLING FUCHSIA—"CAPTIVATION."

EDWARD TILEY has much pleasure in offering the above beautiful FUCHSIA, which he is confident will give entire satisfaction. It was exhibited at the Victoria Park Exhibition in September last, and was awarded by the judges an Extra Certificate of Merit, and much admired by all who saw it. It was also sent to Mr. HENDERSON, of the Pine-apple Nursery, Edgeware-road, London, who gave his opinion as follows:—"I received the box containing Fuchsia Blooms quite safe; it is a really good variety—a vast improvement upon Smith's Ne Plus Ultra; tube good, deep red sepals, quite reflexed, I may say curling over, showing its fine violet-purple corolla to great advantage, being clean, smooth, and round. Send me plants of it when you send it out." It was twice sent to the Editor of the *Gardeners' Chronicle*, whose opinion was similar to the foregoing.

E. T. will commence sending out the above, after the 4th day of June, at 10*s.* 6*d.* per plant. The usual allowance to the Trade when three are ordered. They will be sent in strong tin boxes through the post, if required, package and postage free, on receipt of Post-office Order for the amount.—E. TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney Bridge, Bath.

The Gardeners' Chronicle.

FRIDAY,	— 7	Botanical	8 P.M.
		Royal Institution	8½ P.M.
SATURDAY,	— 8	Horticultural Gardens	1 P.M.

COUNTRY SHOWS.—Wednesday, June 5: Glasgow and West of Scotland Horticultural.—Thursday, June 6: Birmingham Botanical and Horticultural.

IN a few days two pensioners are to be elected at the GARDENERS' BENEVOLENT INSTITUTION, and it may be useful to those who are uncertain how to give their votes, if we draw their attention to what we conceive ought to be the principle to be observed on these occasions.

We need not say that this, like all other recent charities, depends for its existence upon the support of the public. It has no estates, or large hoards of money, on which to rely. The utmost prudence which the managers have been able to exercise, has not resulted in the accumulation of more than a few thousand pounds. It must, therefore, be the first object of the friends of the charity to take every legitimate means of augmenting the annual subscriptions. And although it is to be hoped that the public at large will long continue to aid so good an institution, and that contributions from persons not immediately connected with gardening will become more and more numerous every year; yet it must be obvious that the main reliance of the committee ought to be on gardeners themselves. In fact, if gardeners will not help to increase the fund which *may* be destined for their own benefit, and which *must* be applied for the benefit of their brethren, it is not to be supposed that the general public will take that interest in the charity which might otherwise be anticipated.

Now, do gardeners support their own charity as they could and might? Do they, while in prosperity, contribute their annual mite? We regret to say that although many do, in the most honourable and liberal manner—yet the great body does not. We fear, indeed, that many are more eager to find fault with the committee than to support the charity; endeavouring to conceal or justify their own short-comings by picking holes in the proceedings of those whose only object is to aid them.

Nevertheless, when the day of adversity arrives, as it may arrive to any of them, they are ready enough to become candidates for the support of the charity, even although they have never contributed a shilling to its funds. For instance, in the list of 18 candidates now circulated by the committee, only seven have ever subscribed. We would, therefore, suggest to those who have votes, that they should absolutely refuse them in all cases where no subscription has been paid by the candidates; and that the votes should be confined to the remainder, preference being given, not to priority of application, but to the number of years during which the applicant has subscribed; for it is surely nothing more than justice to regard the available funds of the charity as being claimable in the first instance by those who have created them.

Yet we do not find this rule acted upon; for a candidate, who has never subscribed a farthing, appears to have received at the last election 169 votes, while another, who had subscribed for seven years, only gained 78 votes. Of course, this is the result of a persevering canvas; and, *if the friends of the charity do not act* INFLEXIBLY *upon some fixed principle*, such will always be the case. Elections will be carried by the well-known process of boring and persecuting voters, and not by the claims of the candidates. The best way to avoid this nuisance would therefore, we venture to suggest, be to support in all cases those candidates who have themselves subscribed for the longest period. It is a fair rule, to which no reasonable person can object; it furnishes an answer to all the importunities with which the voters are now assailed; and it cannot fail to add materially to the revenue of the charity. To ACT OTHERWISE IS SUICIDAL.

THE air we breathe, even at a distance from the smoke of the factory or the chemical death-blast, is far from being that pure unmixed æther which many suppose. A glance at a sunbeam peering into a room betrays multitudes of objects otherwise imperceptible, and the observations of the existence of various bodies in the atmosphere to which the question as to the origin of cholera gave rise last year, have lately been much extended by EHRENBERG, who has found a host of organised beings floating at large in the lift. The various instances recorded of the descent of differently coloured rain, are proofs of the enormous quantities of matter occasionally carried about to great distances by currents in the atmosphere. Many such cases have never been submitted to scientific observation, and therefore have been regarded frequently as founded on error, or dreaded by their eye-witnesses as ministers of wrath or foreboders of evil.

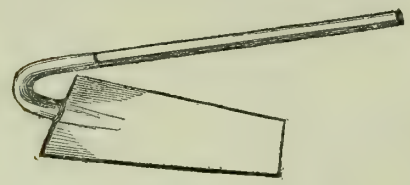
In the autumn of 1845, just before the prevalence of the disease in Potatoes, a shower of inky black rain fell in a wild and scantily inhabited district with which we are acquainted, and was believed to be the agent which carried the Potato murrain through the land. Unfortunately none of the fluid was preserved, or some easier solution of the mystery might possibly have been detected. A yellow rain fell on the 17th of last April, at 11 o'clock A.M., at the Mumbles, near Swansea, the sky being at the time bright and free from clouds. The spots of rain when fresh were of an ochre yellow, and the colour remained for many days, notwithstanding heavy rains, where the spots had fallen. Some of the sediment has been submitted to the microscope, and we find it to consist of what we believe to be pollen grains principally: as far as we can judge from the collapsed and distorted condition in which they now are, those of some species of Salix. At least many of the grains present a single groove in an elliptic body when seen laterally, and when seen from above three grooves or bands in a globular cell. Amongst the pollen grains are the spores of some fungus resembling those of a Cladosporium, but with a broader outline, but not agreeing exactly with anything with which we are acquainted, and branched threads consisting of short articulations, exhibiting the appearance of the infant mycelium of some Antennaria. There is no reason for supposing that these were after-growths, and the spores do not seem to belong to the mycelium, which is evidently young.

Two instances of coloured rain are recorded by Prof. BAILEY, in the "American Journal of Sciences and Arts" for January, 1842, one of which fell at Troy, New York, and the other in the harbour of Picton. Mr. HASSALL has made some observations on these in the "Annals of Natural History" for June, 1842. One of these was not a mere hasty shower, like that in Glamorganshire, but "a portion, alighting upon a vessel in the harbour, on a serene night in June, had to be collected and thrown over by the bucketful in the morning." The substance with which the rain was impregnated at Picton was found to consist wholly of the pollen of Pinus sylvestris; that at Troy presented several forms, amongst which the principal one seemed to be that of some Cupuliferous plant. It is curious that, in most instances of coloured rain, the sky is recorded as being unclouded, which would seem to indicate some electric agency.

BY adopting the mode of IRRIGATING GARDENS, usual in the south of France, our correspondent "J. C." (see p. 326), might distribute his sewage water without need for any hose or pipe. Gardens, as there prepared for irrigation, are first divided into compartments of a convenient length, and from about 30 to 40 feet wide; a channel for water is then formed along the side of each compartment, and the remaining part of it is made up into transverse beds of 3, 4, or more feet wide, according to the crops intended, a narrow water channel being beaten down between each bed, each lesser channel opening into the main one. The compartments are of course disposed longitudinally from a higher to a lower part of the ground. In making up the beds a dam of earth is formed in the main channel, just below each of the lesser ones.

Water for irrigation is usually raised from a well at the highest part of the garden by a chain of buckets; they deliver the water into a trough or reservoir of wood, from whence a stream is conveyed into some one of the main channels, and thence it flows between each transverse bed successively.

The operation of watering is dexterously and expeditiously performed with the tool called in *patois* the *Aissade*. The first dam across the main



channel throws the stream into the first transverse channel; as soon as water has reached the bottom of it, the gardener, with his aissade, takes up the first dam in the main channel, and with the same mould forms a dam across the first transverse channel; by the time this is done, the water has run to the bottom of the second transverse channel; the gardener then takes up the second dam, closes the second transverse channel, and so on till the whole compartment has been irrigated. The next watering is commenced at the bottom of a compartment instead of the top, on account of the different situation of the dams; so, alternately, irrigation commences at the top or at the bottom of each compartment.

In this manner a market garden ground near Montpellier, of four acres, used to be kept in perfect order by the gardener himself, two boys his sons, and one man an assistant, with one woman to weed, though weeds seldom had time to appear.

For seed beds the ground is otherwise arranged; the bed for this purpose is made perfectly level, with a bank of mould 5 or 6 inches high around it; water is let gently through a cut in the bank till the whole bed is well soaked and flooded.

In a market garden the soil of which, like that of "J. C.'s" garden, was a sandy loam, where a crop, while growing, required additional manure, fertilising matter was mixed with the water in a channel as near as might be convenient to the head of the main channel, and thus manure was conveyed by water to the plants of a whole compartment. This affords reason to conclude that the fertilising parts of sewage water would be equally well distributed by the mode of irrigation above indicated.

The sketch of an aissade subjoined is from recollection, but it may give a notion of this useful tool.

The blade might be about 16 inches long, perhaps not more than 6 inches wide. The blade takes up often at once a whole dam, deposits it at once in its new place, then with the under surface of the blade beats down the mould water tight.

Gardeners in the south of France greatly prefer irrigation, as they practise it, to throwing water over the whole surface of a bed; they say that by the latter mode the earth is beaten down so as to exclude air from the roots of plants. And in this they reason justly. In fact, we believe that one of the causes which have impeded the application of liquid manure in this country is the mode of using it. Instead of allowing it to flow gently over the surface, and to soak gradually down to the roots of plants, it is precipitated upon the ground from a water cart, or urged upwards from a hose, so as to be thrown as far as possible from the operator, the result of which is that the earth is gradually rendered impermeable, and incapable of sustaining active vegetation.

We learn by letters from St. Petersburgh, dated May 10, that Dr. Fischer is about leaving the Imperial Botanic Garden, and that Dr. C. A Meyer, his successor, will continue the former relations of that establishment, and of the Imperial Garden at Nikita, in Crimea, with their foreign correspondents.

ENTOMOLOGY.

The House Ant.

The annoyances and actual injuries committed by different species of ants upon our choicest growing vegetable productions has long been known and complained of, but it is only very recently that our domestic economy, in England at least, has suffered from the presence of these troublesome insects. In the hot regions of the globe, however, the case is far otherwise, and various writers upon the East and West Indies have drawn lamentable pictures of the mischief which they commit; thus Captain Green informs us that a small red ant with a black head most pertinaciously detects and attacks sugar and oil, marching to the spot in files about three abreast, and when satiated returning in the same order by a different route. Brown, in his "History of Jamaica," mentions an ant, Formica omnivora, that consumes or spoils all kinds of food. Percival, in his "Ceylon," describes another ant, which inhabits dwelling-houses, devouring everything it can meet with, and which can be kept by no contrivance from invading the table, and settling on the bread, sugar, and such things as they like. But a more remarkable and detailed account of the saccharivorous propensities of an Indian species is described by Col. Sykes, in the first volume of the Transactions of the Entomological Society, which, on account of its large size (the females measuring 19-20ths of an inch in length), and remarkable powers of instinct, must be a formidable inmate in houses. The manœuvres by which these insects contrived to gain access to the fruit, cakes, and particularly China preserved fruits placed upon a table (the feet of which were plunged in water and subsequently surrounded by turpentine), display a most marvellous degree of instinctive faculties.

In England, and especially in the country, it is very rarely indeed that ants become troublesome in doors, although Messrs. Kirby and Spence mention that the large horse ant (Formica rufa) will occasionally plant its colonies in kitchens, and is not easily expelled. Within the last few years some of the houses in Brighton, London, and Liverpool (all seaport towns) have been attacked by swarms of a very minute ant (Myrmica domestica), and which has occasionally increased to such an extent as to drive the inhabitants from their residences, the ants attacking or devouring every article. In one instance these marauders have been traced to a piece of American Pine wood, newly laid down in a kitchen,* and there can, I think, be very little doubt that the species has been imported within the last few years. Dr. Bostock published a notice of this insect, and of the attempts which he had made to dislodge it from his own house (Trans. Ent. Soc. ii., p. 65). The ants were found in a cupboard, where stores were occasionally kept, and also on a range of shelves contiguous to the cupboard, the insects being most numerous in that part where the wall was heated by a fire in the contiguous house. In the month of June the cupboard and shelves were removed, when in all the parts where any of the woodwork had been let into the walls, or even where it had been in contact with the plaster, the animals were found in prodigious quantities, of two sizes, one considerably larger than the other, the larger kind constituting, perhaps, one-sixth of the whole. There were also a very great number of larvæ. They subsequently settled under the floor of the kitchen, and especially fixed themselves in the crevices about the fire-place, and were only dislodged by taking up the flooring, and removing and resetting the grate in cement.

Figure 3*a* represents one of the mandibles of the neuter very highly magnified, showing the four acute teeth with which it is armed, the opposite mandible is of the same shape.

The individuals described by Dr. Bostock, which are those commonly seen, are the small neuters or workers, (fig. 3) which, as in the ordinary ant hills, constitute the great bulk of the community, mingled with females which have lost their wings (fig. 2), and which are of a more elongate shape, as well as very much larger than the neuters. The males have not yet been described; and indeed the species may be said to be still undescribed, Mr. Shuckard's technical description being quite insufficient, consisting as it does of only three lines.† The discovery of the males (for which I am indebted to Mr. F. Smith), and, consequently, of the period when the species arrives at the winged state, is of considerable importance, since it teaches us the time when our attempts to eradicate the species are likely to be attended with most complete success, the destruction of the winged males and females, at the period of swarming, of course preventing the establishment of fresh broods. This event takes place at the end of May, at which time the swarms are in an unusual state of activity. The male (fig. 1), measures about 1⅓ line in length; the female (fig. 2), 2 lines; and the neuter (fig. 3), ¾ of a line. The male is black and opake, except the abdomen, which is glossy, with perfectly transparent wings; the veins (except the principal subcostal one and the stigma), scarcely visible; the antennæ are dirty whitish, with the tips and base dark, and the legs are similarly coloured and dark at the base. The females and neuters are pale yellowish red, with the hinder half of the abdomen brownish black; the female is richer coloured than the neuter, and has the thorax also varied with brown. The accompanying figures will render any description of the different forms of these three kinds of individuals unnecessary. I may add that they are the first figures which have been given of the insect in any of its states.

Various plans have been already proposed for the destruction of these insects. Those recorded in a late number of the *Gardeners' Chronicle* need not here be repeated. Rags, however, well saturated with turpentine thrust into the crevices where they abound will certainly destroy them, as will also oil, if it come in contact with their bodies. Dr. Bostock found lime very serviceable in expelling them, and water in which the outer green skins of Walnuts have been soaked has been used with success; salt has also been stated to be objectionable to them. One of the simplest and most effectual remedies is to lay wide-mouthed bottles in their tracks or near the mouths of their burrows, placing bits of raw meat within. The ants will greedily attack the latter, and may be destroyed from time to time by shaking the bottle over hot water. Of course the destruction of the winged males and females during the time of swarming merits the greatest share of our attention. *J. O. W.*

* Proceedings of Ent. Soc., i., xxv., xxxii.
† Charlesworth's Mag. of Nat. History, ii., 627.

REZOIL.

It is well known that the patience and labours of the horticulturist are frequently rendered unavailable by the appetite of some insects. For preserving their flowers from these enemies, gardeners have adopted several plans, not one of which appears to be effective, more especially against the earwig, which is most to be feared as the flowers approach maturity. How many show Dahlias are thus "cut off in their bloom!" With the hope that the following receipt will offer some check to these marauders, I send it to you, assured that its cheapness and easy application will render it universally appreciated.

Take of common resin, 1¼ lb.; sweet oil, 1 lb.; place them in a pipkin over the fire until the resin is melted, stir the materials together, that they may be well blended; when cold the substance formed, which I call "rezoil," will be of the consistency of treacle. To use the rezoil it should be spread with a brush upon threads or any fitting material, and wrapt round the stem of the plant; if any support is used that should be brushed over also. No insect can possibly, or will attempt to cross this barrier; the rezoil never dries, but always remains sticky and clammy—its action as a trap is therefore obvious. To preserve Grapes and other wall fruit we have only to nail a strip of list upon the wall, round the entire plant, and then paint it well with the rezoil, on both sides, if it can be managed, to keep insects from crawling under as well as over. Other modes of application will suggest themselves without my here enumerating them. Birds, cats, and mice equally avoid soiling themselves with this substance. *Septimus Piesse*, 43, *Molyneux-street.*

DISEASES OF PLANTS.

(*Continued from p.* 325.)

The mollusca of the genus Limax, or slugs, are quite as fatal to agriculture. Our peasantry and gardeners distinguish two species, the *lumaconi* and *lumacotti*, or large and small slugs. It is certain that tobacco or snuff sprinkled on the animal causes so copious a secretion of the viscous humour on the surface of the body, that it swells and dies. But this remedy is only applicable in the case of a few plants in pots, and to the large not the small kinds. Woe to the field once infested by the latter! their ravages are incalculable; there is not a vegetable production they do not devastate. Whilst the Limax hyalinus, *L.*, lays waste our gardens, attacking more especially the Kidney Beans, the Limax agrestis, *L.*, infests our corn fields, and I have often seen the whole of the epidermis and cellular tissue of the leaves of Wheat devoured by them, leaving the fibres intact. For the former kind it has been recommended, and may produce some effect, to cover the seed beds with ashes, for which others substitute lime or very fine sand. In most seasons, and in low ill drained ground, badly cultivated, they multiply in an extraordinary degree, so as that no portion of the plants escapes from their teeth. In gardens the larger slugs as well as snails may be easily got rid of by putting every here and there reversed garden pots on the ground, so placed as that they may creep under to shelter themselves from the heat of the sun. In this manner I have taken great quantities.

Class V. Indeterminate Diseases.—I have thus designated those diseases whose origin is either entirely unknown, or deduced from observations contradictory in themselves, or from hypotheses which, however brilliant, have no real foundation. It is indeed a mortifying thing to see amongst these diseases precisely those which from the earliest times have been the subject of the studies of philosophers, and that they are those which produce the greatest havoc in this country, whilst Nature refuses as yet to disclose to us the secret of their causes. Nevertheless, as I have said in my preliminary discourse, there are no vegetable diseases on which so much has been written by men of sound doctrine, of exactness of observation, and of careful judgment. I would mention in the first place Tillet's *Dissertation sur la cause qui corrompt et noircit les graines de blé dans les épis, et sur les moyens de prévenir ces accidens.* This writer has deserved well of agriculturists, because he first fixed the characters of diseases of corn, and indicated some means of warding off the most terrible of them. Haller, who in general is not much disposed to praise Italians, as may be easily seen in his "Bibliotheca Botanica," prefers to Tillet's treatise that of Count Francesco Ginanni, entitled *Trattato delle malattié del grano in erbo*, which appeared four years after Tillet's dissertation. Both writers worked simultaneously on the same subject. Ginanni treated it with more detail, and his book may be considered as one of the best we have. Much has since been written, but by all authors of good faith, Ginanni is deservedly and repeatedly quoted. Finally, the celebrated Tessier in his *Traité sur les maladies des graines*, and in his articles inserted chiefly in the agricultural part of the "Encyclopédie Méthodique," which may be considered as so many separate treatises,

has deservedly gained not only universal praise, but what is more, the well earned gratitude of cultivators, to whom his enlightened theories and practical experience have been of the greatest use. I have thought it my duty to mention these three works, in order that, as I shall myself only advert to the chief points, those who wish to become perfectly acquainted with the results of the long experience, and the fine observations and theories made on the diseases of cereals, may know where to look for them, and be sure that they are not wading in turbid waters.

VILLA AND SUBURBAN GARDENING.

The successful pot culture of plants was considered some few years back to be a secret in the hands of a few eminent gardeners. Continued investigation into the theory and practice of cultivation in relation to this department of gardening has, however, exploded this notion. The whole matter is now simplified, and the practice rendered easy even to the amateur. The nature of soils and the modes of mixing them are no longer involved in mystery. The secret of potting, if such a thing ever existed, is now numbered with the things that were. Watering has been rendered plain. In fact, the whole operations pertaining to plant cultivation are now perfectly known. The amateur has had ample opportunity of informing himself on all these points. It may be instructive, therefore, on the present occasion to lay down a few particulars relating to the treatment of plants during their growth, taking it for granted that all other conditions have been complied with.

As I stated on a former occasion, the use of stakes in plant culture has become an intolerable nuisance, opposed to every principle of propriety and good taste. It is true that the faggot system has ceased to have so many admirers; and, if a general war is waged against it, the skill of our cultivators will supersede its use, or will at least limit its application. One of the causes which has induced this superabundant use of props, has been a system of culture that aimed at the production of large specimens in a short period of time. Young plants in vigorous growth received large shifts; they were then placed in close or warm houses, in order to promote an unnatural growth. These rampant shoots demanded support, which under a more natural system of culture would not have been required. The result of such management proved that every successive growth required a fresh array of supports, until the plants at length exhibited a greater amount of dead wood than living branches. As I have stated, the taste for such things is rapidly changing, and a better system of management is daily being developed.

The above observations apply to plants requiring greenhouse protection. Let us therefore take a New Holland plant, in a small pot, that we may be desirous to grow and flower as a specimen; give it a moderate shift, and place it in a position to receive, in all suitable weather, a large proportion of atmospheric air; keep it perfectly cool, and as the season advances, expose it entirely in a situation partially protected from the direct rays of the sun. The recognition of art as an element in cultivation is not to be disputed; hence, as the plant progresses in growth, it will be necessary to stop the over-luxuriant shoots, which will throw strength into the plant generally. The abundance of air and light, with which it has been supplied during its growth, will produce a stout robust habit, contradistinct from the spindly, lanky, etiolated form similar plants exhibit under unnatural and tortuous culture. In stopping luxuriant shoots, under any circumstances, never destroy the form which Nature has given to the particular species. A plant may possess all the rigidity of growth necessary to support it, with little aid from props, without assuming the only shape given to nearly every plant by modern cultivators, viz., a hemispherical one. Avoid this by all means, and endeavour to produce every specimen after its natural habit. An Eriostemon and a Kalosanth surely take different forms. *Pharo.*

TRADE MEMORANDA.

Does any one know what is done with the loam that is stowed away under the arches of the Croydon Railway? It is uncommonly like guano.

Home Correspondence.

Width between rows of Vegetables and deep stirring in the intervals.—In your "Calendar of Operations" an excellent rule is given, which is not sufficiently attended to, viz., that of making the distance between the rows of plants wide enough to allow of deep stirring of the soil between them. In effecting this, I find Dr. Newington's hand-cultivator of the greatest service. Like all the inventions of that gentleman, it is not only quite original, but completely answers the purpose for which it is intended. A backward crop of Cabbages in my garden this spring, by the constant use of the cultivator, was converted into one of the earliest. The instrument not only loosened the soil, with trifling labour, deeper every time it was used, but also moulded up the Cabbages at the same time. This is important, for the spring growth of such vegetables is not from the original root, but from fresh rootlets, which are sent forth by the stem near the surface of the soil, and the looser it is the more vigorous is the growth of the plant. The implement has many other uses. With it one man will do the work of six in drawing drills for sowing Carrots and such crops. I have used it for two years, and can testify to its utility both as an agricultural and horticultural implement. I know of no hand instrument which will vie with it in performing the work it is adapted for so economically and effectually. *L. Stephenson, Souldern, Oxon.*

Shell Walks.—I have lately laid out a flower garden in the formal style; and, for the sake of colour, it was desirable that some of the walks should be laid with a whitish material. I have adopted shells for this purpose, and, as far as effect is concerned, they answer admirably, not being too white, but in practice they make untidy flower beds, as it is almost impossible to avoid scattering the shells over the borders in walking. Will any one inform me whether there are any means of making shell walks tolerably firm and compact, either by any peculiar method of making them, or by the use of any substance as a binding material, which will have the effect of concreting the shells together without destroying the colour? I ought, perhaps, to add, that the walks are only 3 feet wide, and form rather an intricate design of some extent, and therefore rolling them is almost out of the question. *B., Canterbury.* [We presume that your shells are too thickly put on the walks. Try a thinner coating rolled over with clay, or lime and clay in the state of mortar.]

Sewage Irrigation.—After two or three years' experience of the value of sewage for garden purposes, I am convinced that it has only to be fairly tried to be generally used. It is desirable (previous to using it), to pass the sewage through a filter of gravel or coarse sand, or what is better for permanent crops, such as Asparagus, or Vines, or Grass, through a basket or a box pierced with holes. It is not easy to use it extensively, through small permanently placed pipes, or pipes pierced with small holes, since they are too apt to be filled with one peculiar portion of sewage, viz., the mixture of grease and earthy matter, which soon prevents the passage of the sewage; for this reason (from the facility of cleansing the filter readily), it is best to filter the sewage downwards. In my own garden at Croydon, we have irrigated with house sewage four Asparagus beds, each about 60 feet in length, for the last two years. The Asparagus is planted in double rows, between which a little open channel is formed, and along this the sewage fluid flows. The irrigation, since February, has been repeated about once a fortnight; the beds were made in 1848, and the crop of this year has been abundant and more forward than any we have heard of in this neighbourhood. We have been cutting almost daily since the 17th of April. We remark a strong tendency in the Asparagus to grow towards and in the little sewage channels. In some recently made Grass plots, formed for experimental purposes in the same garden, the produce bids fair to rival all that is accomplished on an equal space in the meads of Clipstone and Edinburgh. In these, and for other purposes, I find no mode better for the distribution of the sewage than fixed earthen pipes, of 2 or 3 inches bore, which have their garden terminus at such an elevation as to empty their contents into open portable wooden troughs, pitched in the inside, and in lengths of about 20 feet each. As the valuable suggestions of Prince Albert will probably induce many of your readers to turn their house sewage to a profitable account, these results of between two and three years' trial, may be useful. *Cuthbert W. Johnson.*

Araucaria imbricata.—At page 325, "K.," of Cork, solicits information as to "the cause of the leaves of Araucaria imbricata turning brown." He describes the appearance of his plant and the situation in which it grows. Your reply is, that the mischief is probably produced by wet. I am disposed to attribute it to sudden exposure during or prior to the prevalence of cold winds, either by removing other plants which had afforded protection, or by planting out incautiously. I have plants of Araucaria imbricata as well of 10 years growth as very young, not one of which has suffered, however exposed, this year; but I also purchased in the spring (early) from Messrs. —— a very fine specimen (price 6 guineas), growing in a tub, and perfectly well rooted, though the leaves had not the fine dark gloss which my others have, and indeed the lower branches when examined carefully have a mossy appearance. This plant came down carefully packed (in the tub); it was perhaps a little injured in the extremities of some leaves; it was planted on the 5th of April, upon a mound of excellent compost of black soil and fresh loam, upon a layer of brickbats, and well drained, in a situation exposed to the east. Subsequently we have had great prevalence of dry weather and strong east winds; so long as they lasted the plant was protected by bunting, and has been occasionally watered since. It has every promise of making good growth this year, but nevertheless a great many of the leaves have the brown appearance alluded to by "K." I attribute it wholly to exposure, the plant having been under glass prior to its coming from the nursery garden; and although I agree with your observations in page 282, vol. 2, second series of the Horticultural Society's "Transactions," that the Araucaria imbricata is perfectly hardy, I do not think it so entirely prefers an open situation, that it can be planted out into one without considerable care. Should the leaves which have turned brown be removed, and if so when should that be done? *R. T. P., Lancaster.* [Wait till they are dead; they will then drop of themselves, or they may be readily broken off. This will happen near Midsummer.]

Transplanting Vegetables.—When the season arrives for transplanting Broccolies and other vegetables, I gently raise the seed-beds with a Potato fork, so as to spring the roots of the plants. I then water with a rosed watering-pot, and in 10 or 15 days, as circumstances permit, I water again, raise, draw, and plant; watering the bed if more plants were wanted for another period. Celery, Endive, Lettuces, flower beds, seed pots (with proper instruments), I have treated as above; and the plan may be extended to Strawberry runners for potting or for rows; Carrots, Onions, Beet, and Turnips; also to forest trees, shrubs, and grain, if it is desirous to increase any particular sort, such as the Peruvian Barley imported by Lord Lonsdale. *T. Torbron, Lower Tottenham.*

Skirretts.—For the last three or four years I have vainly endeavoured to raise a crop of these nice little roots, in consequence of the seed failing to vegetate. This has been procured both from provincial and London seedsmen. In the spring of 1848 a few plants were reared by sowing a little seed in heat, and from them seed was obtained in the autumn. This, sown in shallow drills in the open ground, April 5, 1850, has, up to this day, May 20, shown no signs of appearing above ground. Will some obliging correspondent help me to grow a few dishes of this agreeable old-fashioned vegetable? Is the seed of very short vitality? or does it require any peculiar mode of sowing as to depth, &c.? A few rows of it are worth having annually in one's garden, if only to set juvenile horticulturists and cloyed epicures a-wondering what capital and promising new esculent it can be. *D.*

Exhibition in 1851.—The *prestige* in favour of porous flower-pots being on the decline, I may express a hope that some public-spirited persons will not think it beneath their abilities to pay attention to them, so as to produce some specimens at the great exhibition of 1851, which shall unite the cheapness and utility of the present race with elegance of shape and improvement in colour. They are the means of providing rational and innocent amusement, and employment, to thousands of our fellow subjects; and the more such pursuits are encouraged amongst those who live by labour the less will the gin-shop be frequented. Drawing-room flower-pots may be soon devised, though porcelain pots have always an incongruous appearance; but it is a model for the million that is required—for those who under every disadvantage of means and station, yet cultivate with pride and delight flowers equal to any of those at the command of the rich and the great. I could have offered some suggestions, but they are perhaps out of your line. *An Amateur.*

Brown Scum on Water.—In the run of a spring, which issues out of a bank through a pipe, 2 feet above the level of a river, from which it is about 3 yards distant, I am growing Water-cress. The bed of the runlet spreads from one foot to about five or six at the lower end. The water is particularly good and clear, but a quantity of muddy scum came on the surface; I thought this might arise from the soil it ran over. I therefore got some gravel pebbles some inches thick, just under the surface, which I expected would be quite clear, and free from such appearance. I find, however, a sort of blackish weed spreading over the face of the stones, in which the roots of the Cress are striking, and a great deal of nasty looking scum all over the surface. Would this floating substance be best removed by occasionally flooding the place, and thereby bringing it to the top? *J. T. P., Newbold Vicarage, Rugby.* [The scum will probably disappear; the cause of it we should be glad if some correspondent would explain.]

A Country Curate's Garden.—I observe, at p. 197, a strong recommendation for country clergymen with small stipends to keep bees, as a means of increasing their annual income, and at the same time affording an interesting as well as profitable recreation. There is a little anecdote attached to the expression "keep bees," with which, as it may not be known to all your clerical readers, I will preface some other remarks on bee-keeping, made the better part of a century ago by a celebrated divine and naturalist in Suffolk. "A French bishop, on paying his annual visit to his clergy, observed one of his curates whose income was certainly very inadequate to his appearances of much comfort and plenty; so much so, that the rev. prelate was quite astonished, and could not avoid saying to the curate, 'How is all this, my friend; you are the first man in this visitation whom I have met with a cheerful face and a plentiful board. Have you any income independent of your curé?' 'Yes, my lord, I have,' replied the curate, 'otherwise my family would starve on the pittance I receive from the poor parishioners I instruct. Accompany me into my garden, my lord, and I will there show you my bank, from which I receive an annual dividend; it never stops payment, and is moreover a constant source of pleasure and health.' The good bishop was shown a long range of well managed bee-hives, and ever after this memorable visit, when any of his clergy complained of poverty, he said to them 'Keep bees! keep bees!'" About the year 1756, the Rev. Stephen White, then rector of Holton, in Suffolk, published a method of managing bees without destroying them when he partook of the luscious stores which they had collected for him, in what he called his collateral bee boxes. And his introduction, as well as his conclusion to the said treatise, are so perfectly in unison with the remarks made at p. 197, that I am induced to send you a transcript, for the sake of some of your clerical readers. The reverend author thus observes, at p. v. of his Introduction: "The smallness of my cure has afforded me more leisure hours than usually fall to the share of a great part of my brethren. Many of those hours, during almost the whole space of a now declining life, have been spent in my bee garden, with as much innocence, I hope, and a great deal more to my taste and

entertainment, than if they had been spent with a gun and a pointer in the fields, or in my parlour with a pack of cards. These fashionable amusements (especially the latter), can afford little entertainment to a contemplative mind, but the surveying the works of Nature, particularly the instinct and polity of many living creatures, and the wonderful methods they make use of for their sustenance and safety, will give a real and high delight to a rational soul; and as it is next to impossible to turn our thoughts to the observation of these creatures, without lifting them up, at the same time, in adoration of Him who formed them, this will in a manner sanctify our pleasures, and turn even our diversions into a sacrifice to our Maker. Manifold are the works of God, and in wisdom has he made them all; but if my partiality for my favourite insects does not very much deceive me, their indefatigable industry, their loyalty to their queen, the geometrical accuracy of their combs, &c., are wonders not to be met with in any of the innumerable beasts, birds, or insects that are upon the face of this earth. My fondness for these little animals soon put me upon endeavouring, if possible, to save them from fire and brimstone. I thought I had reason to be content to share their labours for the present, and great reason to rejoice, if I could, at the same time, preserve their lives, to work for me another year. The main drift, therefore, of all my observations and experiments has been to discover an easy and cheap method, suited to the abilities of the common people, of taking away so much honey as can be well spared, without destroying or starving the bees." The author, in conclusion, says, "Being now almost ready to take my leave of the reader, I will tell him honestly and seriously what he is to expect if it shall please him to make trial of my boxes. In a few years I will venture to promise him he will increase his stock to as great a number as the flowers in his neighbourhood will maintain, but my assurance will carry me no further; and sad experience has taught me, that in some situation like this, in which I am myself (in this respect) unhappily placed, that number will be found very small. There are now in the village where I dwell, which is a large one, only seven colonies of my own in boxes, and two poor hives of my neighbours: yet we have beautiful meads, and fine gardens, in which Flora discloses all her beauties; but, alas! they are beauties *indotatæ*. For want of a free and open air, as I conjecture, in these thick enclosures, our flowers yield so little food for the poor bees, that no greater number, I am well satisfied, than what I have mentioned, or thereabouts, can get a subsistence in this place; whereas in the neighbouring bleak county of Cambridge, where the inundations of the fens, or the farmer's plough, or the flocks that are grazing (should I say, or starving?) on barren heaths, will suffer hardly any flowers to spring or open their blossoms (excepting the flowers of eloquence, which thrive exceedingly on the banks of Cam, but these afford only a thin sort of *juice nectareous*, fitter for poets than bees to feed on), yet here, I say, there is such a profusion of honey in the few flowers which escape, that I have seen between 70 and 80 hives in one farmer's yard, and this just after the inquisition was over, and he had been murdering all he intended to murder that season, and these hives, I know too well, were much better stored with honey than any are found to be in these parts. I have often thought it very surprising that neither the authors who treat of bees, nor the keepers of them, ever imagine that any place can be overstocked, or that anyone's bees fare better or worse for the larger or smaller stock that is kept in his neighbourhood; they think, it seems, that every flower they see is a never-failing cruise of honey. Let me here acknowledge the bounty of our Creator, and, with due thankfulness and admiration, confess that in some sense it is so; for when a bee, with its little lambent trunk, has cleared a flower of all its present store, another comes, it is likely, in less than a minute and finds something; for the delicious juice is continually transuding through the pores of the plant. But it is certain, for all this, that the more of these guests visit a flower the worse must each of them fare; they will have the less to carry home, or, which is all one, they must go further, and spend more of their precious time before they can make up their burden. There is reason to believe, however, that in many parts of the kingdom the little labourers in honey and wax are not sufficient for the harvest." *Mellarius.*

Distribution of Liquid Sewage.—I observe that "J. C." is desirous of knowing the best and cheapest method of distributing liquid manure. The following results of recent experience in my own case are quite at his service: I lately got from Mr. Statham, Cornwallis-street, Manchester, a gutta percha pipe 1½-inch in diameter outside, and eight-tenths of an inch diameter inside, for the purpose of distributing the liquid from a tank over a meadow lying below the farmstead, and therefore very conveniently situated for such a purpose. I have used this pipe with a small forcing pump, and found it answer perfectly. The cost was 8*d.* a foot, or 2*s.* a yard, which is considerably less than that of "J. C.'s"—"100 feet of patent 1½-inch hose of hemp woven without a seam, which, with three unions, cost 9*l.* 17*s.*, and was at the end of the second season rotten and useless." The gutta percha pipe, for the same length, would be only 3*l.* 6*s.* 8*d.*, but I thought this too expensive for farm work; and being at Manchester a few days ago, I found on inquiry that the next-sized piping, which only differs from the former in not being quite so thick in substance, but in my opinion perfectly strong enough for the purpose, would only cost 6*d.* a foot, or 25 per cent. less than the one I got in the first instance. 100 feet of the latter piping would only cost 2*l.* 10*s.*, and there is every reason to think that this material, with proper care, will last for any length of time. If a great length were required, and it were desirable to have it made in lengths, Mr. Statham has a very neat and simple kind of joint, which he supplies, I believe, at 3*s.* 6*d.* apiece, but I have not yet tried one of these. *William J. Garnett, Bleasdale, Garstang.*——I have been using a flexible waterproof hose, made of canvas lined with gutta percha, and also a gutta percha union joint, of the most simple construction; both are perfectly tight under pressure. They appear very durable, and were not half the price paid by your correspondent. *Jas. Norris, Sion-hill, Brentford-end.* [This kind of tubing has been repeatedly advertised in our columns by Mr. Hancock, of Goswell-mews, Goswell-road, London. See also an advertisement from Messrs. Burgess and Key in another column.]——If "J. C." will apply to Mr. Patterson, Egerton-street, Hulme, Manchester, for information respecting hose piping and the distribution of liquid manure, I have no doubt he will be able to obtain the information he requires, the publication of which in your Paper would be an advantage to many people. *J. W. T.*
